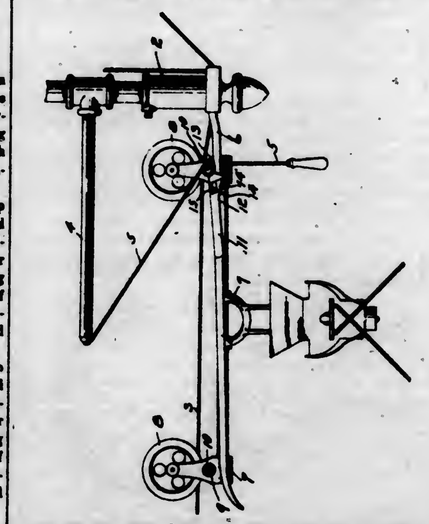
4. A shoe including a lining, gum pieces stretched over the leg and foot of the lining and overlapping each other, and a leg surrounding the lining and consisting of a front, a back and a segmental piece, the front and back being cemented together along their side edges, and the front having a depending vamp portion and a slit extending downward thereinto from its upper edge, said segmental portion being permanently fitted in said slit and serving to spread said front.

809,714. STORE-SERVICE APPARATUS. CHARLES J. MILLER, Minneapolis, Minn. Filed Oct. 7, 1904. Serial No. 227,880.



Claim.—1. The combination, with a station and way, of friction-arms beneath said way, a carrier, a propelling device therefor, and means provided in connection with said arms for offering a yielding resistance to the passage of said carrier.

2. In a device of the class described, the combination, with friction-arms, of plates pivoted thereon at one end, and having beveled opposite ends, and springs provided between the beveled ends of said plates and said arms.

3. In a device of the class described, the combination, with friction-arms, of means for offering a yielding resistance to the passage of the carrier thereover, and means for adjusting said resisting means to vary the degree of resistance, substantially as described.

4. In a device of the class described, the combination, with friction-arms, of plates pivoted thereon at one end, and having beveled or inclined opposite ends, springs provided between said plates and arms, and pivoted dogs carried by said arms and arranged to engage said plates and lock them in different positions with respect to said arms, substantially as described.

5. The combination, with a station and line-wire and a carrier-

propelling device, of a carrier, and means for offering a yielding resistance to the discharge of said carrier from said station.

6. The combination, with a station and a line-wire, and a carrier-propelling device, of a carrier, and means for offering a yielding resistance to the entrance of said carrier into a station and its discharge therefrom.

7. The combination, with a station, a way and a carrier-propelling device, of a carrier, and yielding plates having beveled ends against which said carrier is normally in contact when at the station, substantially as described.

8. The combination, with a station and a way, of a carrier, pivoted plates beveled at one end in the path of said carrier, and springs provided in connection with said plates.

9. The combination, with friction-arms, of plates pivoted thereon; springs provided between said plates and arms, and pivoted dogs arranged to engage said plates and lock them in different positions with respect to said arms.

809,715. **BOWLING-ALLEY.** DAVID MILLER, Evanston, Ill. Filed May 3, 1904. Serial No. 206,169.

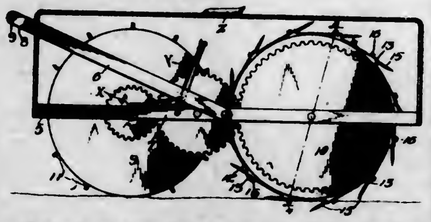
Claim.—1. In a bowling-alley, in combination, a pin-table, a horizontal ball-track leading thereto and on substantially the same plane therewith, and an upwardly-inclined rigid ball-deflector interposed between the track and the table.

2. In a bowling-alley, in combination, a pin-table having a downward lateral incline and pin-seats of uniform height on the table.

3. In a bowling-alley, in combination, a pin-table having a downward lateral incline from the center in each direction and pin-seats of uniform height on the table.

4. In a bowling-alley, in combination, a pin-table having lateral inclines, pin-seats of uniform height on the table, a ball-track leading to the table, and an upwardly-inclined ball-deflector located between the track and the table.

809,716. **HARROW.** EDWARD R. MILLER, Wytheville, Va. Filed May 3, 1905. Serial No. 258,005.



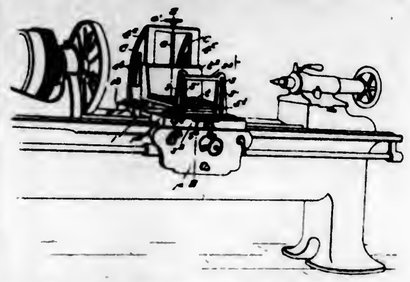
Claim.—1. An implement of the class described comprising a revolubly-mounted drum and teeth carried by the drum said teeth being adjustable to extend at different distances beyond the periphery of the drum and being also adjustable longitudinally of the drum.

2. In a harrow the combination with a revoluble drum of projections carried by the drum and having pockets therewithin teeth engaged in the pockets and adjustable to extend to different distances thereof, and means for holding the teeth at different points of their adjustment said teeth extending at tangents to the drum and in the same direction.

3. An implement of the class described comprising a frame, a traction-drum revolubly mounted in the frame, a harrow-drum revolubly mounted in the frame, connections between the two drums for simultaneous rotation in the same direction and at different rates of speed, teeth carried by the harrow-drum and extending at tangents thereto in the same direction and draft appliances shiftable to lie at opposite ends of the frame.

4. An implement of the class described comprising a frame a pair of drums journaled in the frame, spikes carried by one of the drums, clamping-bands engaged with the other drum for movement longitudinally thereof, said bands being adapted to be clamped upon the drum to hold them against movement thereupon, projections carried by the bands and having pockets therein, teeth engaged in the pockets and adjustable to extend at different distances therefrom, means for holding the teeth at different points of their adjustment said teeth extending in the same direction and at a tangent to the drum and connections between the drums for simultaneous rotation thereof at different rates of speed.

809,717. **LATHE ATTACHMENT.** GEORGE H. MOSS, Fairmont, W. Va. Filed Mar. 13, 1905. Serial No. 249,882.



Claim.—1. In combination with a lathe-carriage having a front and a rear rail; a standard projected vertically from the rear rail of the lathe-carriage, a second standard projected vertically from the front rail thereof, the said second standard being slotted vertically, a supplemental carriage or bed member extended over the lathe-carriage, said bed member having guides at its opposite edges for engaging the front and rear standards, means operatively mounted on the rear standard for adjusting the bed member and holding it to its adjusted position.

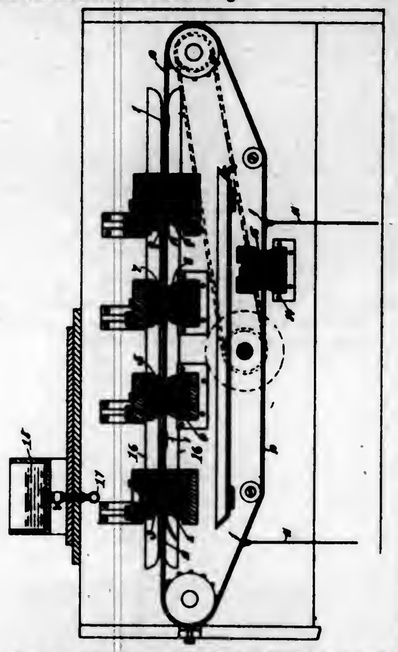
2. An attachment for lathes of the character described, comprising in combination, the ⌐-shaped standard whose pendent members terminate in right-angled feet to engage the angle-corner of the rear rail of a lathe-carriage, a pair of vertically-slotted standards adapted to be fastened on the top of the front rail of the lathe-carriage, a supplemental carriage or bed member, having guides at the outer edge to coact with the slotted front standards, its rear edge merging with a vertical back, the latter having means for riding on and being rigidly secured to the pendent members of the ⌐-shaped frame, and having a threaded socket on its rear face, and the feed-screw mounted on the cross-head of the frame and engaging the socket on the back of the bed member.

3. In combination with the lathe-carriage having a front and a rear rail, a ⌐-shaped standard projected vertically from the rear rail of the carriage, a second standard projected vertically from the front rail thereof, said second standard including a pair of upwardly-projecting slotted members, a supplemental carriage or bed member extending over the lathe-carriage, said bed member having guides at its opposite edges for engaging the first-mentioned standard, bolts passing through said slotted members and entering the supplemental bed member, and means operatively mounted on the rear standard for adjusting the bed member and holding it to its adjusted position.

4. In combination with the lathe-carriage having a front and a rear rail, a ⌐-shaped standard projected vertically from the rear rail of the carriage, a second standard projected vertically from the front rail thereof, said second standard including a pair of upwardly-projecting slotted members, a supplemental carriage or bed member extending over the lathe-carriage, said bed member having guides at its opposite edges for engaging the first-mentioned standard, bolts passing through said slotted members and entering the supplemental bed member, and means operatively mounted on the rear standard for adjusting the said member and holding it to its adjusted position, said supplemental bed member having a plurality of transverse slots and provided with bolt-receiving apertures, substantially as shown and described.

809,718. **LEATHER-SHAGGING MACHINE.** WILLIAM H. MOORE, Salem, Mass., assignor to Moore Leather Machine Company, Kittery, Me. Filed Jan. 2, 1903. Serial No. 36,035.

Claim.—1. In a leather-coloring machine the combination of a carrier for the skins comprising a bar and means for conducting the same in a predetermined path, coloring means which are arranged on opposite sides of said path and are adapted to apply the color to the skins as they are carried doubled over said bar, and a flexible apron which is connected to said bar at one edge.



2. In a leather-coloring machine the combination of a carrier for the skins comprising a bar and means for conducting the same in a predetermined path, coloring means which are arranged on opposite sides of said path and are adapted to apply the color to the skins as they are carried doubled over said bar, and a flexible sheet-metal apron which is pivotally connected to said bar at one edge.

3. In a leather-coloring machine the combination of a carrier for the skins comprising a bar and means for conducting the same in a predetermined path, coloring means which are arranged on opposite sides of said path and are adapted to apply the color to the skins as they are carried doubled over said bar, a flexible sheet-metal apron, a stiffening-strip which is secured to one edge of said apron, a pair of hinges which connect the ends of said strip and said apron to said bar so that said apron may swing with respect thereto.

4. In a leather-coloring machine the combination of a carrier for the skins, comprising two endless chains, a carrier-bar which is connected to said chains, means for driving said chains and for conducting said rod in a predetermined path, coloring means which are arranged on opposite sides of said path and are adapted to apply the coloring to the skins as they are carried doubled over said bar, an apron which is connected to said bar at one edge, so that said bar may rotate with respect thereto, and means for removing the coloring-matter from the surface of said apron as it returns to again pass between the color-applying means.

5. In a leather-coloring machine the combination of a carrier for the skins, comprising two endless chains, a carrier-bar which is connected to said chains, means for driving said chains and for conducting said rod in a predetermined path, coloring means which are arranged on opposite sides of said path and are adapted to apply the coloring to the skins as they are carried doubled over said bar, an apron which is connected to said bar at one edge, so that said bar may rotate with respect thereto, and means for removing the coloring-matter from the surface of said apron as it returns to again pass between the color-applying means, said means comprising a pair of stationary absorbent-pads between which the bar and apron are conducted by said chains.

6. In a leather-working machine, the combination with a pair of liquid-applying devices, means for supplying them with liquid material, and a pair of cleaning devices, of a two-faced skin-support, and means for moving it between the liquid-applying devices and the cleaning devices.

7. In a leather-working machine the combination with a pair of liquid-applying devices, means for supplying them with liquid material, and a pair of absorbent-pads, of a two-faced skin-support, and means for moving it between the liquid-applying devices and said pads.

8. In a leather-working machine the combination with a carrier, a two-faced skin-support which is pivotally connected thereto, a pair of liquid-applying devices, a pair of cleaning devices, and means for conducting said support between said liquid-applying devices and said cleaning devices successively.

9. In a leather-working machine, the combination of a pair of liquid-applying devices, means for supplying them with liquid material, a flexible two-faced skin-support, and means for moving it between said liquid-applying devices, substantially as described.

10. In a leather-working machine, the combination of a pair of liquid-applying devices, means for supplying them with liquid material, a flexible two-faced skin-support, a pair of endless chains to which said flexible skin-support is connected, and means for moving said chains to carry the skin-support between said liquid-applying devices, substantially as described.

11. In a leather-working machine, the combination of a pair of liquid-applying devices, means for supplying them with liquid material, a flexible two-faced skin-support, a pair of endless chains to which said flexible skin-support is pivotally connected, and means for moving said chains to carry the skin-support between said liquid-applying devices, substantially as described.

12. In a leather-working machine, the combination of a pair of liquid-applying devices, and means for conducting liquid material thereto, an impervious skin-support having oppositely-disposed faces each of greater area than half the area of one side of the skins to be placed thereon, and means for moving said support between said liquid-applying devices, substantially as described.

13. In a leather-working machine, the combination of a pair of liquid-applying devices, means for supplying them with liquid material, a two-faced skin-support and means for moving it between said liquid-applying devices, and a cleaning device over which said skin-support is drawn, substantially as described.

14. In a leather-working machine, the combination of a pair of liquid-applying devices, means for supplying them with liquid material, a two-faced skin-support and means for moving it between said liquid-applying devices, and a stationary cleaning device over which said skin-support is drawn, substantially as described.

15. In a leather-working machine, the combination of a pair of liquid-applying devices disposed one above the other, means for conducting liquid material to the uppermost of said devices, a two-faced skin-support and means for moving it between said liquid-applying devices in an endless path, and a cleaning device for one face of said support which is disposed on the same side of said path as the uppermost liquid-applying device, substantially as described.

16. In a leather-working machine, the combination of a pair of suitably-driven endless chains, a pair of front and a pair of rear sprockets over which said chains pass, a two-faced skin-support which is connected to both of said chains and extends between them, a pair of liquid-applying devices between which said support is drawn as it is advanced from said front to said rear sprockets, and a stationary cleaning device for one face of said support over which said support is drawn as it is returned from said rear to said front sprockets, substantially as described.

17. A leather-working machine comprising a two-faced skin-support, means for moving the same in a predetermined path, means arranged on opposite sides of said path for applying liquid material to a skin as it is carried by said support, and means, likewise arranged, for removing the liquid from portions of the support uncovered by the skin, substantially as described.

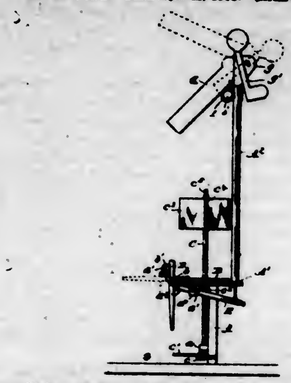
18. In a leather-working machine, a pair of liquid-applying devices and means for conducting liquid material thereto, a pair of flexible-faced pads, a two-faced skin-support, and means for moving it between said liquid-applying devices and said pads successively, substantially as described.

19. In a leather-working machine, the combination of a pair of liquid-applying devices and means for supplying them with liquid material, a two-faced non-absorbent skin-support, and means for conducting the same between said liquid-applying devices, substantially as described.

20. A leather-working machine comprising a pair of liquid-applying devices and means for supplying them with liquid material, a pair of combined rubbing-in and cleaning devices, a pair of independently-cleaning devices, a two-faced skin-support, and means for moving it between said liquid-applying devices, said combined rub-

bing-in and cleaning devices and said independent cleaning devices successively, substantially as described.

809,719. RAILWAY-SWITCH STAND. EDWARD L. HERGAN, Little Rock, Ark. Filed Apr. 12, 1905. Serial No. 255,169.



Claim.—1. In a switch-stand, the combination with the supporting-frame, of a member for operating the switch-points, an operating-lever for said member, means for locking the lever in the positions to which the switch may be thrown, a signaling device, and means for operating the latter automatically and independently of the operating-lever when the switch is fully thrown.

2. In a switch-stand, the combination with the supporting-frame, of a member for operating the switch-points, a pivoted operating-lever for said member, means for locking said pivoted lever in the positions to which the switch may be thrown, a signaling device, and means for operating the latter automatically when the pivoted lever is in position to be locked and to hold the signaling device in an operative position during the movement of the switch-operating member from one position to another.

3. In a switch-stand, the combination with a supporting-frame and signaling device, of a movable member for operating the switch-points and provided with recesses in the under side thereof, and a pivoted member counterbalanced so as to operate the signaling device and so that one end thereof will engage the under side of the aforesaid member and enter the recesses therein.

4. In a switch-stand, the combination with the supporting-frame having notches therein, a disk for operating the switch-points rotatable on said frame and provided with a slot, a lever pivoted in said slot and adapted to engage the notches in the supporting-frame, a pivoted member one end of which is adapted to engage the disk and enter the slot therein, and a signaling device connected to said pivoted member.

5. In a switch-stand, the combination with the supporting-frame having notches therein, a disk for operating the switch-points rotatable on said frame and provided with a slot, a lever pivoted in said slot and adapted to engage the notches in the supporting-frame, a member pivoted beneath the rotatable disk with one end engaging the under side thereof and having a portion adapted to enter the slot therein, and a signaling device connected to the pivoted member.

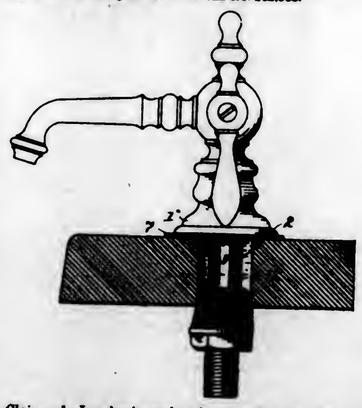
6. In a switch-stand, the combination with the supporting-frame having notches therein, a disk for operating the switch-points rotatable on said frame and provided with a slot and a recess at different points, a lever pivoted in the slot, a member pivoted beneath the disk so that one end of the former will engage the under side of the latter and enter the slot and recess therein, and a signaling device connected to the pivoted member.

7. In a switch-stand, the combination with the supporting-frame having notches therein, a disk rotatably mounted on the frame and adapted to operate the switch-points, said disk having a slot and a recess at different points, a lever pivoted in the slot and adapted to engage the notches in the supporting-frame, a yoke pivoted under the disk so that one end thereof will engage the under side of the disk and enter the slot and notch therein, said end of the yoke being adapted to be engaged by the lever when the latter is swung upon its pivot, and a signaling device connected to the yoke.

8. In a switch-stand, the combination with the platform having notches therein, a disk rotatable on the platform and adapted to operate the switch-points, said disk having a slot therein, a lever pivoted in the slot and adapted to engage the notches in the platform, a yoke pivoted under the disk and having a portion adapted to enter the slot in the disk in the path of the movement of the pivoted lever, a lug on said lever adapted to engage the yoke, and a pivoted signal-blade or semaphore connected to the yoke and operated thereby.

9. In a switch-stand, the combination with the supporting-frame comprising a platform and an upright or post, said platform having notches therein, a disk rotatably mounted on the platform for operating the switch-points and having a slot therein, a lever pivoted in said slot and adapted to engage the notches in the platform, a yoke pivoted under the platform with one end thereof bearing against the under side of the disk and adapted to enter the slot therein, a reflecting medium on the upright, a signal-arm pivoted on the upright and connected to the yoke, and a shutter on the signal-arm adapted to screen the reflecting medium, substantially as herein shown and described.

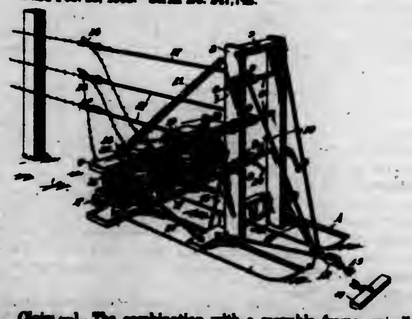
809,720. BASIN-COCK. PHILIP MUELLER, Decatur, Ill., assignor to H. Mueller Manufacturing Company, Decatur, Ill., a Corporation of Illinois. Filed May 20, 1905. Serial No. 261,263.



Claim.—1. In a basin-cock, a base to sit on the slab, a longitudinally-ribbed extension to pass through the hole of the slab, a threaded end of the ribbed extension, a washer conforming to the ribbed extension and having a corrugated or roughened bearing-surface, and a nut for the threaded end of the extension.

2. In a basin-cock, a base to sit on the slab, a longitudinally-ribbed extension to pass through the hole of the slab, a threaded end of the ribbed extension, a conical, fluted washer conforming to the ribbed extension, and a nut for the threaded end of the extension.

809,721. WIRE STRETCHER AND STRINGER. WILLIAM F. MYERS, Broken Bow, Nebr., assignor of one-half to Charles H. Lehnen. Filed Feb. 23, 1905. Serial No. 247,742.

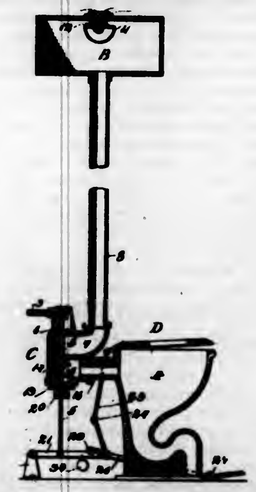


Claim.—1. The combination with a movable frame, spindles thereon for the support of spools of wire, of a spool-brake, hooks extending from the frame to the spool-brake and a brake-lever adapted to be hooked to one of the spool-spindles and exert pressure upon the spool-brake.

2. The combination with runners, cross-pieces secured thereto, uprights extending upward from the runners, guy-rods extending from the upper end of the uprights and from the forward cross-piece to a common point, and means connecting the guy-rods at such point, of spindles extending upward from the rear cross-piece, spools, a spool-brake, a brake-lever, and means extending from the spool-brake to the forward cross-piece for supporting the spools and their spindles at their upper ends.

3. The combination with a frame, comprising runners, uprights and cross-pieces, of means for anchoring the machine, rods extending therefrom to the uprights and one of the cross-pieces, spindles on one of the cross-pieces, a brake, and rods extending from the brake to one of the cross-pieces.

809,722. AUTOMATIC VALVE FOR WATER-CLOSETS. JOSEPH C. McCABE, Weston, W. Va., assignor of one-fourth to William J. Alexander, one-fourth to William H. Hoyt, and one-fourth to John O'Hare, Norwalk, Ohio. Filed Sept. 17, 1904. Serial No. 224,515.



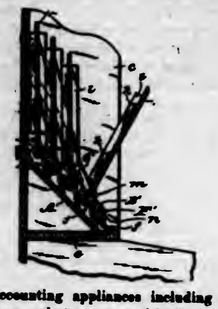
Claim.—1. In a device of the character specified, the combination of a closed tank, an inlet-valve thereto, an outlet-valve therefrom, a stem for said inlet and outlet valves, an operating-lever connected with said stem, a bowl, a movable seat thereon, a draw-rod having a break-joint, connecting said movable seat with said operating-lever, a treadle-lever having a slotted connection with said operating-lever, and an air-outlet valve in said tank, adapted to be closed automatically when the tank is filled.

2. In a device of the character specified, the combination of an inlet-chamber, a valve-chamber, an outlet-chamber, a tank connected with the valve-chamber, an air-outlet valve in said tank adapted to be closed automatically when the tank is filled, an inlet-valve between said inlet-chamber and valve-chamber, an outlet-valve between said valve-chamber and said outlet-chamber, a valve-stem connecting said inlet and outlet valves and having a passage communicating with said inlet and outlet chambers, a bowl, a passage leading from said outlet-chamber to said bowl, an operating-lever connected with said valve-stem, a movable seat, a draw-rod connecting said seat with said operating-lever and having a break-joint therein, a foot-lever having a slotted connection with said operating-lever, and a weight attached to said operating-lever.

809,723. CREDIT-ACCOUNTING APPLIANCE. FIRST A. McCARTHY, Lisbon, Ohio. Filed July 27, 1905. Serial No. 271,421.

Claim.—1. Credit-accounting appliances including a frame provided with a plurality of studs having each a spring mounted removably thereon, and a plurality of bill-holding leaves mounted in the frame and engaged by the springs.

2. Credit-accounting appliances including a frame having upright ends provided with slots having undercut journal-bearings at the sides of the bottoms thereof, bill-holding leaves having journals mounted in the bearings, and springs mounted on the frame and engaging the leaves.

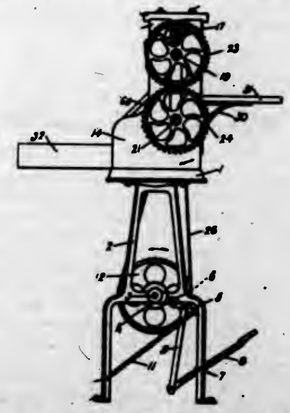


3. Credit-accounting appliances including a case, a frame mounted in the case, a button mounted in the back of the case and cooperating with the frame, bill-holding leaves mounted in the frame, and springs mounted in the frame engaging the leaves.

4. In credit-accounting appliances, the combination of a frame-base having a groove in the top thereof and also having upright ends one or both of which is provided with a plurality of studs, and springs mounted on the studs having each an arm seated in the groove and also a movable arm, with bill-holding leaves pivoted in the frame ends and engaged by the movable arms of the springs.

5. In credit-accounting appliances, the combination with a frame having journal-bearings, and bill-holding leaves having journals mounted in the bearings, of studs attached to the frame, springs coiled about the studs removable therefrom and engaging the leaves, and means for normally holding the springs on the studs.

809,724. TOBACCO-STRIPPING MACHINE. JOSEPHUS H. McINTOSH, Providence, R. I. Filed Mar. 8, 1905. Serial No. 248,963.



Claim.—1. In a machine of the character described, the combination with a pair of stripping-rolls, of a plate upon the periphery of one of the rolls, a recess in said roll, a cutter mounted in the second roll adapted to register with said plate, and a pair of pinching-jaws in the second roll adapted to register in said recess.

2. In a machine of the character described, the combination with a pair of stripping-rolls, one of which rolls is provided with a peripheral recess, of pinching-jaws mounted in the second roll and adapted to register in said recess.

3. In a machine of the character described, the combination with a pair of stripping-rolls, one of which is provided with a peripheral recess, of pinching-jaws in the second roll, adapted to register in said recess, and means for actuating the jaws.

4. In a machine of the character described, the combination with a pair of stripping-rolls, one of which is provided with a peripheral recess, of pinching-jaws in the second roll adapted to register in said recess, means for actuating said jaws, a cutter slidably mounted in one of the rolls adapted to contact with the periphery of the other roll, and means for reciprocating the cutter.

5. In a machine of the character described, the combination with a pair of stripping-rolls, one of which is provided with a peripheral recess, of a pair of pinching-jaws adapted to register in said recess, means for actuating said jaws, a cutter slidably mounted in one of the rolls adapted to contact with the periphery of the other roll, and means for reciprocating the cutter.

809,725. APPARATUS FOR TRANSFERRING PHOTOGRAPHIC IMAGES. ALBERT MEYER, Berlin, Germany. Filed Jan. 31, 1905. Serial No. 243,722.

Claim.—1. The herein-described apparatus for transferring photographic images, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the sensitive material, and means for moving the sensitive material over said rest, substantially as described.

809,727. GAS-FIXTURE. PATRICK J. HEVERN, Haverhill, Mass. Filed Feb. 23, 1905. Serial No. 246,508.

controlling said heating-circuit, and a thermostat and an electromagnetic device in the motor-circuit for opening and closing said

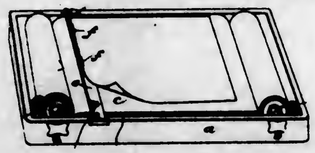
5. In a machine of the character described, the combination with a pair of stripping-rolls, one of which is provided with a peripheral recess, of a pair of pinching-jaws pivotally mounted in the second roll and adapted to register with said recess, shanks upon said jaws, a spring intermediate the shanks a pin upon one of the shanks, a pivoted lever contacting with the second shank, and with the pin, a slidable bar contacting with the first shank, and means for reciprocating the bar.

6. In a machine of the character described, the combination with a pair of stripping-rolls, one of which is provided with a peripheral cutter-plate, of a cutter mounted in the second roll, a flange upon the cutter-plate, spring means contacting with the flange for retaining the knife in elevated position, a slidable bar provided with a beveled shoulder mounted in the second roll and resting upon the flange, and means for reciprocating the bar.

7. In a machine of the character described, the combination with the bed of supports upon the bed, a stripping-roll provided with a peripheral recess mounted in the supports, a second stripping-roll also mounted in the supports and resting upon the first roll, adjustable spring means in the supports for retaining the rolls in contact with each other; pinching-jaws mounted in the second roll adapted to register in said recess, a flange upon the jaws, a reciprocating cutter in one roll adjacent the pinching-jaws, a flange upon the cutter, a slidable bar contacting with one of the shanks, a second slidable bar engaging the cutter-flange, and means upon the supports contacting with the rolls for reciprocating both bars.

8. In a machine of the character described, the combination with the bed of supports upon the bed, a pair of stripping-rolls mounted in the supports, cam-plates upon the supports adjacent the ends of one roll, pinching-jaws in said roll, a cutter also in said roll, slidable bars in said roll for actuating the jaws and cutter projecting beyond the ends of the roll and contacting with the cam-plates, and springs in the roll and engaging the bars for forcing the bars outwardly.

809,725. **DUPLICATING APPARATUS.** LOUIS C. NEFF, New York, N. Y. Filed Apr. 18, 1905. Serial No. 256,326.



Claim.—1. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged stops.

2. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus and carrying thereon angularly-arranged stops, and means whereby said base may be fixed relatively to said sheet, strip or body.

3. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops, whereby the margins on said rest may be varied.

4. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops, whereby the margins on said rest may be varied, said rest having a plurality of angularly-arranged gage-lines adjacent to said stops.

5. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops, whereby the margins on said rest may be varied, and means whereby said base may be fixed relative to said sheet, strip or body.

6. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged stops, said base having bearings on each end thereof, and screws adapted to enter said bearings and force said base upon said sheet, strip or body.

7. A paper-guide attachment for duplicating apparatus, comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged stops, said base having slotted bearings on each end thereof, and channeled screws adapted to enter said slots and move said base toward and from said sheet, strip or body.

8. A paper-guide attachment for duplicating apparatus comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged stops, said base having slotted bearings on each end thereof, channeled screws adapted to enter said slots and move said base toward and from said sheet, strip or body, and a metallic face-plate adapted to receive said screws and to be attached to the support for said sheet, strip or body.

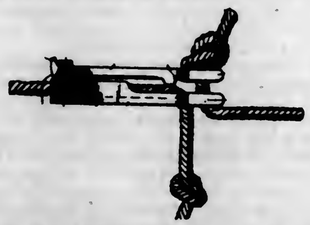
9. A paper-guide attachment for duplicating apparatus comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops consisting of a plurality of pivotal top stops spaced apart and a pivotal side stop forming a geometrical angle with said top stops.

10. A paper-guide attachment for duplicating apparatus comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops consisting of a plurality of pivotal top stops spaced apart, and a pivotal side stop forming a geometrical angle with said top stops, said base having bearings on each end thereof, and screws adapted to enter said bearings and force said base upon said sheet, strip or body.

11. A paper-guide attachment for duplicating apparatus comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops consisting of a plurality of pivotal top stops spaced apart, and a pivotal side stop forming a geometrical angle with said top stops, said base having bearings on each end thereof, and screws adapted to enter said bearings and force said base upon said sheet, strip or body, said rest having a plurality of angularly-arranged gage-lines adjacent to said stops.

12. A paper-guide attachment for duplicating apparatus comprising a base presenting upwardly a non-adhesive rest extending into close proximity to the transfer sheet, strip or body of the apparatus, and carrying thereon angularly-arranged adjustable stops consisting of a plurality of pivotal top stops spaced apart, and a pivotal side stop forming a geometrical angle with said top stops, said base having slotted bearings on each end thereof, and channeled screws adapted to enter said slots and move said base toward and from said sheet, strip or body, said rest having a plurality of angularly-arranged gage-lines adjacent to said stops.

809,726. **CORD-CLAMP.** EDWARD NELSON, Jersey City, N. J. Filed Dec. 9, 1904. Serial No. 236,183.

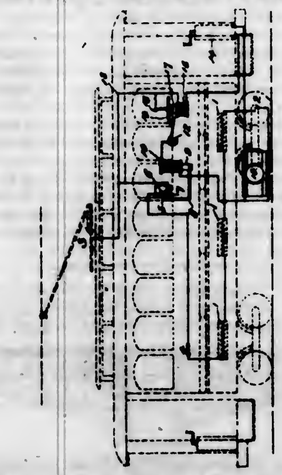


Claim.—A cord-clamp comprising a body-plate formed in its upper side with a longitudinal groove and provided at one end with a loop, said plate also being provided between its center and opposite end with upright flanges arranged on opposite sides of the contiguous portion of the groove and connected adjacent their outer ends by a transverse arched portion overlying the groove, and a lever member having one end bent to form a hook, the concaved side of the hook engaging the arched portion and forming a pivoting portion on which the lever is adapted to swing and the concaved side of the hook forming a cam or eccentric face to clamp the cord against the underlying grooved portion of the body-plate, the opposite end of said lever having a loop to aline with the loop of the body-plate and a depending serrated projection adjacent thereto to engage and clamp the cord against the grooved face of the body-plate, adjacent to the loop thereof, substantially as described.

809,727. **GAS-FIXTURE.** PATRICK J. HAVERN, Haverhill, Mass. Filed Feb. 28, 1903. Serial No. 145,889.

Claim.—In a gas-fixture, the combination of a burner, and a gas-supply pipe, the latter being coiled above the flame into the form of a hood or cone closed at the top, for the purpose of serving as a bell to protect the ceiling against burning and discoloration.

809,728. **ELECTRICAL HEATING SYSTEM.** ARTHUR D. NEWTON, Hartford, Conn., assignor to General Electric Company, a Corporation of New York. Filed July 3, 1901. Serial No. 215,860.



Claim.—1. In combination, a source of current-supply, a heating-circuit and a circuit including a translating device connected to said source of current-supply, a switch in said heating-circuit, and means responsive to the mutual action of the local temperature and the current in the circuit containing the translating device for operating said switch.

2. In a car-heating system, a source of current-supply, a heating-circuit and a motor-circuit connected to said source of current-supply, and governing means for said heating-circuit responsive to the mutual action of the temperature in the car and the current in the motor-circuit.

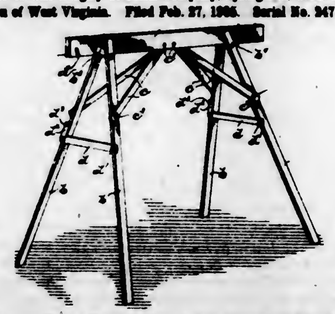
3. In combination, a source of current-supply, a heating-circuit and a motor-circuit connected to said source of supply, a switch for controlling said heating-circuit, and a thermostat and an electroresponsive device in the motor-circuit for opening and closing said switch.

4. In combination, a source of current-supply, a heating-circuit and a motor-circuit connected to said source of current-supply, a switch for controlling said heating-circuit, and a thermostat and electroresponsive device in the motor-circuit tending to operate said switch upon variations in the local temperature and in the motor-current.

5. In combination, a source of current-supply, a heating-circuit and a motor-circuit connected to said source of current-supply, a switch in said heating-circuit, an electromagnet for operating said switch, a switch controlling the circuit of said electromagnet, and means responsive to variations in local temperature and in current in said motor-circuit for opening and closing said latter switch.

6. In combination, a source of current-supply, a heating-circuit and a motor-circuit connected to said source of current-supply, a switch in said heating-circuit, an electromagnet for operating said switch, a switch controlling the circuit of said electromagnet, a thermostat operating to produce relative movements of the members comprising said latter switch upon variations in local temperature, and an electromagnet in the motor-circuit also arranged to produce relative movements of the members of said latter switch upon variations in the motor-current.

809,729. **TRESTLE.** JOSEPH M. NORMAND, Springfield, Ohio, assignor to The Ridgely Trimmer Company, Springfield, Ohio, a Corporation of West Virginia. Filed Feb. 27, 1905. Serial No. 247,404.



Claim.—1. In a device as described, a beam, spreading legs connected together in pairs by means which support said beam, and permit the upper ends of said legs to embrace said beam above said support, links pivotally attached to said legs at one end and at their opposite ends pivoted to said beam intermediate said legs and the adjacent ends of said beam, and braces for holding said structure in its erect position, substantially as specified.

2. In a knockdown trestle as described, the combination, with a beam, of spreading legs, a swinging connection between each pair of spreading legs and the beam, the swinging connection of one pair of legs being of sufficient length to pass beyond the end of the beam, and a sliding engagement between the last-named swinging connection and the beam to bring the connected legs within the limit of the beam when folded, substantially as specified.

3. In a device as described, the combination of a beam, spreading legs therefor connected in pairs, a notch in the under side of said beam adjacent to one end thereof, a swinging link connecting one pair of spreading legs and the beam, and having its pivotal connection with the beam substantially midway between the adjusted position of said legs and said notch, a notch in the upper side of said beam and adjacent to the opposite end; a swinging link connecting the second pair of legs and said beam, and having its pivotal connection substantially midway between the adjusted position of said legs and the end of the beam, and means for maintaining said legs in their adjusted positions.

4. In a device as described, a beam, spreading legs therefor connected in pairs, braces for maintaining said legs in relation to the beam, a longitudinal slot in the under side of said beam adapted to receive said braces when in the folded position, and transverse notches in said beam adapted to receive the connecting means of said spreading legs when in folded position, substantially as and for the purpose specified.

5. A folding trestle comprising a beam, spreading legs, the upper ends of which are adapted to extend on each side of said beam

and embrace the same, a support for said beam which also forms the

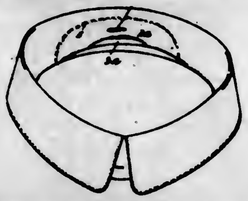
and embrace the same, a support for said beam which also forms the means for connecting said legs in pairs, connecting-links pivotally securing said legs with said beam at points intermediate said legs and the ends of said beam, and braces for maintaining said structure in its erect position, substantially as specified.

6. A folding trestle comprising a beam, spreading legs having jaws at the upper end thereof to clamp the beam, means connecting said legs and sustaining the weight of the beam, pivoted links connecting said spreading legs and beam at points intermediate of the adjusted position of said legs and the extremity of the beam, and braces secured to said beam and engaging said legs, substantially as specified.

7. In a folding trestle, a beam, spreading legs adapted to clamp said beam, swinging links connecting said legs and beam at points intermediate the adjusted position of the legs and the ends of the beam, and a slotted connection between one of said links and the beam whereby the link will be permitted to swing on varying radii, substantially as and for the purpose specified.

8. In a folding trestle, the combination with a beam of spreading legs, means for supporting the beam upon the upper ends of said legs, swinging connections and supports secured to said beams whereby one pair of legs may be moved from a position below said beam to a position above and then in alinement with said beam, while being maintained in substantial parallelism therewith, substantially as and for the purpose specified.

809,780. BUTTON-GUARD FOR COLLARS. FREDERICK H. HOBBS, Detroit, Mich. Filed Apr. 11, 1904. Serial No. 202,897.



Claim.—A turndown collar comprising a turndown portion, a neckband having an inner and outer member, the inner member of which is provided with a buttonhole at the center of the back portion, and buttonholes at the ends thereof and the outer member covering the back buttonhole of the inner member.

809,781. WATERPROOF COMPOUND. OTTOKAR H. NOWAK, Chicago, Ill., assignor of one-half to Eugene Smith, Chicago, Ill. Filed Apr. 14, 1905. Serial No. 255,651.

Claim.—1. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water and an albuminoid.

2. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water and casein.

3. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, an albuminoid and a coloring ingredient.

4. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, and an adhesive.

5. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, an albuminoid and a solvent.

6. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, casein and a solvent.

7. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, an albuminoid and water.

8. A compound for the purpose described comprising a preparation of dioxynaphthylmethane soluble in water, casein, and water.

809,782. CROSS-BEARER. ALLEN B. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed July 7, 1905. Serial No. 268,609.

Claim.—1. In a cross-bearer for cars, the combination with center sill, comprising members having outwardly-disposed upper flanges, of webs secured to and projecting from opposite sides of the center sill, said webs having flanges on their upper edges which project beneath the outwardly-disposed flanges of the center-sill members to which they are secured, the top edges of the webs at all other portions being not lower than the tops of the center sill, and a pressed-steel compression member secured to the bottom of each web and connected to the webs of the center-sill members; substantially as described.

3. In a cross-bearer for cars, the combination with a center sill, of webs secured to and projecting from opposite sides of the center sill, and a pressed-steel compression member secured to the bottom of each web, the inner ends of said pressed-steel compression members abutting the center sills, from which point they gradually diminish in width toward the outer ends of said webs; substantially as described.

4. In a cross-bearer for cars, the combination with a center sill, outwardly-projecting webs carried by said center sill, and pressed-steel channel members 13 connected to the bottoms of said webs and having their inner ends abutting the center sill; substantially as described.

5. In a cross-bearer for cars, the combination with a center sill, webs connected to the sides of the center sill and having their bottom edges below the neutral axis of the center sill, and pressed-steel compression members secured to the bottoms of said webs and to the sides of the center sill, said compression members having downwardly-projecting flanges wider near the center sill than near the outer ends of said webs; substantially as described.

6. In a cross-bearer for cars, the combination of center-sill members spaced apart and having outwardly-projecting integral flanges, webs connected to the center-sill members and having portions above the top flanges, said webs being secured to the under sides of the top flanges, pressed-steel channel compression members secured to the bottoms of said webs, and a straight flat tension member secured to the tops of said web and passing over the center sill; substantially as described.

7. The combination with a center sill having a boxed-in diaphragm connecting the center-sill members and of a height equal to the height of the center sill, a continuous cover-plate for the center sill and connected to said diaphragm, the webs 10 and 11 connected to said center-sill member, side sills connected to the ends of the webs, and compression members connected to the center sill and webs and terminating short of the side sills; substantially as described.

809,783. CROSS-BEARER. ALLEN B. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed July 7, 1905. Serial No. 268,610.

Claim.—1. In a cross-bearer for cars, the combination with a center sill, oppositely-flanged web members carried by the center sill and arranged in pairs back to back, a tension member connected to the upper flanges of the web members, and U-shaped brackets whose flanges are connected to the bottom flanges of the web members; substantially as described.

2. In a cross-bearer for cars, the combination with a center sill, pairs of web members secured to the respective outer sides of the center sill, and a pressed-steel bracket connecting the respective web members of each pair to the respective webs of the center-sill member; substantially as described.

3. In a cross-bearer for railway-cars, the combination with center-sill members spaced apart, a filler between the center-sill members comprising pairs of webs, a continuous top cover-plate connected to the center-sill members and the filler, pairs of web members projecting in opposite directions from the center-sill members, and a channel-section secured to the under side of each diaphragm on the outer sides of the center-sill members; substantially as described.

2. In a cross-bearer for cars, the combination with a center sill comprising members having outwardly-disposed upper flanges, of webs secured to and projecting from opposite sides of the center sill, said webs having flanges on their upper edges which project beneath the outwardly-disposed flanges of the center-sill members to which they are secured, the top edges of the webs at all other portions being not lower than the tops of the center sill, and a pressed-steel compression member secured to the bottom of each web and connected to the webs of the center-sill members; substantially as described.

3. In a cross-bearer for cars, the combination with a center sill, of webs secured to and projecting from opposite sides of the center sill, and a pressed-steel compression member secured to the bottom of each web, the inner ends of said pressed-steel compression members abutting the center sills, from which point they gradually diminish in width toward the outer ends of said webs; substantially as described.

4. In a cross-bearer for cars, the combination with a center sill, outwardly-projecting webs carried by said center sill, and pressed-steel channel members 13 connected to the bottoms of said webs and having their inner ends abutting the center sill; substantially as described.

5. In a cross-bearer for cars, the combination with a center sill, webs connected to the sides of the center sill and having their bottom edges below the neutral axis of the center sill, and pressed-steel compression members secured to the bottoms of said webs and to the sides of the center sill, said compression members having downwardly-projecting flanges wider near the center sill than near the outer ends of said webs; substantially as described.

6. In a cross-bearer for cars, the combination of center-sill members spaced apart and having outwardly-projecting integral flanges, webs connected to the center-sill members and having portions above the top flanges, said webs being secured to the under sides of the top flanges, pressed-steel channel compression members secured to the bottoms of said webs, and a straight flat tension member secured to the tops of said web and passing over the center sill; substantially as described.

7. The combination with a center sill having a boxed-in diaphragm connecting the center-sill members and of a height equal to the height of the center sill, a continuous cover-plate for the center sill and connected to said diaphragm, the webs 10 and 11 connected to said center-sill member, side sills connected to the ends of the webs, and compression members connected to the center sill and webs and terminating short of the side sills; substantially as described.

809,783. CROSS-BEARER. ALLEN B. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed July 7, 1905. Serial No. 268,610.

Claim.—1. In a cross-bearer for cars, the combination with a center sill, oppositely-flanged web members carried by the center sill and arranged in pairs back to back, a tension member connected to the upper flanges of the web members, and U-shaped brackets whose flanges are connected to the bottom flanges of the web members; substantially as described.

2. In a cross-bearer for cars, the combination with a center sill, pairs of web members secured to the respective outer sides of the center sill, and a pressed-steel bracket connecting the respective web members of each pair to the respective webs of the center-sill member; substantially as described.

3. In a cross-bearer for railway-cars, the combination with center-sill members spaced apart, a filler between the center-sill members comprising pairs of webs, a continuous top cover-plate connected to the center-sill members and the filler, pairs of web members projecting in opposite directions from the center-sill members, a channeled pressed-steel section secured to the under side of each pair of web members and to the outer side of each center-sill member, and a top member connecting the respective pairs of outwardly-projecting web members; substantially as described.

4. In a cross-bearer for cars, the combination with a center sill, pairs of web members secured to and projecting from opposite sides of the center sill, and a channeled pressed-steel bracket secured to the bottom of each pair of web members the inner ends of said brackets being of greatest dimensions and abutting the center sill, from which point they gradually diminish in width toward the outer ends of said web members; substantially as described.

5. In a cross-bearer for cars, the combination with a center sill, pairs of web members connected to the outer sides of the center sill and having their bottom edges below the neutral axis of the center sill, and pressed-steel brackets secured to the bottoms of said pairs of web members to connect the adjacent members together, said brackets being secured to the sides of the center sill and having outstanding channeled portions; substantially as described.

6. In a cross-bearer for cars, the combination of center-sill members spaced apart and having outwardly-projecting integral flanges, pairs of web members connected to the center-sill members and having oppositely-disposed top flanges secured to the under sides of the top flanges of the center-sill members, channel-brackets substantially U shape in cross-section secured to the bottoms of said web members and connecting them together in pairs, the inner ends of said brackets abutting the center-sill members, and a tension member secured to the top flanges of said pairs of web members and passing over the center-sill members; substantially as described.

7. In a cross-bearer for cars, the combination of center-sill members spaced apart and having outwardly-projecting integral flanges, pairs of web members connected to the center-sill members and having oppositely-disposed top flanges secured to the under sides of the top flanges of the center sill, channel-brackets secured to the bottoms of said web members and connecting them together in pairs, and a straight flat tension member secured to the tops of said pairs of web members and passing over the center sill; substantially as described.

8. The combination with a center sill having a diaphragm-filler comprising two webs arranged back to back and having oppositely-disposed flanges connected to the center-sill members, said filler being of a height equal to the height of the center sill, a continuous cover-plate for the center sill and connected to said filler, pairs of web members connected to the outer sides of said center sill and having outwardly-disposed flanges, channel side sills having inwardly-disposed flanges between which the outwardly-disposed flanges of the last-named web members are confined, and top and bottom members connecting the outwardly-disposed flanges of the respective last-named web members; substantially as described.

9. In a cross-bearer for cars, the combination of center-sill members spaced apart and having outwardly-projecting integral flanges, web members connected to the center-sill members and having top and bottom flanges, said web members terminating short of the bottom flanges of the center-sill members, and pressed-steel brackets secured to the outer sides of the webs of the center-sill members and to the bottoms of the first-mentioned web members, said brackets being wider at their ends near the center sill than at their ends near the side sills of the car, and said brackets being above the lower edges of the center sill; substantially as described.

809,784. CROSS-BEARER. ALLEN B. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed July 12, 1905. Serial No. 269,255.

Claim.—1. A cross-bearer comprising a continuous flat top member, a continuous bottom member, the ends of the top and bottom member being connected, gusset-plates secured to the top and bottom members near their ends, car side sills to which the said top and bottom members are terminally secured, and diagonal braces connected to the side sills and to the top members; substantially as described.

2. In a railway-car, the combination with a center sill, of side sills, a flat plate tension member passing over the top of the center sill and beneath the side sills, a compression member passing below the center sill and connected to the tension member and side sills, and braces connected to the top plate tension member and to the side sills; substantially as described.

3. In a railway-car, the combination with a center sill, of side sills, a flat plate tension member passing over the top of the center sill and beneath the side sills, a compression member passing below the center sill and connected to the tension member and side sills, and pressed-steel braces connected to the top plate tension member and to the side sills; substantially as described.

4. In a railway-car, the combination with a center sill, of side sills, a flat plate tension member passing over the top of the center sill and beneath the side sills, a compression member passing below the center sill and connected to the tension member and side sills, and pressed-steel braces having ribs 18 connected to the top plate tension member and to the side sills; substantially as described.

5. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the center sill and under the side sills, angles comprising a compression member and extending from side sill to side sill, a gusset interposed between the angles and connected to the top plate tension member, braces connected to the side sills and the tension member, and braces connected to the compression member and the center sills; substantially as described.

6. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the center sill and under the side sills, angles comprising a compression member and extending from side sill to side sill, a gusset interposed between the angles and connected to the top plate tension member, and braces connected to the side sills and the tension member; substantially as described.

7. In a cross-bearer for cars, a flat plate tension member, a rolled-shape compression member, a strut, webs connecting the compression and tension members near their ends, and braces connecting the compression member and the strut; substantially as described.

8. In a railway-car, a cross-bearer having a continuous flat top tension member, a rolled-shape bottom compression member, web members connecting the top and bottom members, and diagonal braces connected to the top of the flat top tension member and to the upper portions of the side sills and forming supports for the nailing-strips of the floor; substantially as described.

9. In a railway-car, the combination with the center sills and the side sills thereof, of a flat plate tension member passing over the top of the center sill and beneath the side sills, a compression member passing beneath the center sill and secured to the side sills, and pressed-steel braces 17 connected to the top of the tension member and to the upper portion of the side sills; substantially as described.

10. In a railway-car, the combination with the center sill and the side sills, a diaphragm interposed between the center sill members and having its top edge below the neutral axis of the center sill, angles connected to the diaphragm and extending to points adjacent the top of the center sill, a tension member passing over the top of the center sill and extending from side sill to side sill, a compression member passing below the center sill and extending from side sill to side sill, and webs connecting the compression and tension members; substantially as described.

11. In a railway-car, the combination with the center sill and the side sills, a diaphragm interposed between the center-sill members and having its top edge below the neutral axis of the center sill, angles connected to the diaphragm and extending to points adjacent the top of the center sill, a tension member passing over the top of the center sill and extending from side sill to side sill, a compression member passing below the center sill and extending from side sill to side sill, webs connecting the compression and tension members, and braces connected to the top of the compression member and to the side sills; substantially as described.

12. In a railway-car, the combination with the center sill and the side sills, a diaphragm interposed between the center-sill members and having its top edge below the neutral axis of the center sill, angles connected to the diaphragm and extending to points adjacent the top of the center sill, a tension member passing over the top of the center sill and extending from side sill to side sill, a compression member passing below the center sill and extending from side sill to side sill, webs connecting the compression and tension members, and braces connected to the compression member and to the center sill; substantially as described.

13. In a railway-car, the combination with the center sill and the side sills, a diaphragm interposed between the center-sill mem-

bers and having its top edge below the neutral axis of the center sill, angles connected to the diaphragm and extending to points adjacent the top of the center sill, a tension member passing over the top of the center sill and extending from side sill to side sill, a compression member passing below the center sill and extending from side sill to side sill, webs connecting the compression and tension members, braces connected to the top of the compression member and to the side sills, and braces connected to the compression member and to the center sill; substantially as described.

809,785. CROSS-BEARER. ALLEN H. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed July 15, 1905. Serial No. 270,206.

Claim.—1. A cross-bearer comprising a continuous flat top member, a continuous channel bottom member, a center sill interposed between the top and bottom member, and braces 22 connected to the center sill and channel; substantially as described.

2. A cross-bearer comprising a flat top member, a channel bottom member, a strut interposed between the top and bottom members, side sills to which the top and bottom members are secured, braces connecting the top member and side sills, and braces connecting the strut and channel bottom member; substantially as described.

3. A cross-bearer comprising a flat top member, a channel bottom member, a center sill interposed between the top and bottom members, terminally connecting-plates 11 and 13 carried by the top and bottom members, respectively, and side sills to which said connecting-plates are secured; substantially as described.

4. In a railway-car, the combination with the center sill and side sills thereof, of a tension member passing over the top of the center sill, a compression member passing below the center sill and connecting-plates 11 and 13 terminally carried by the tension and compression members and beneath the side sills to which they are secured; substantially as described.

5. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the top of the center sill and beneath the side sills, a continuous channel compression member passing beneath the center sill and secured to the bottoms of the side sills, said channel having depending flanges; substantially as described.

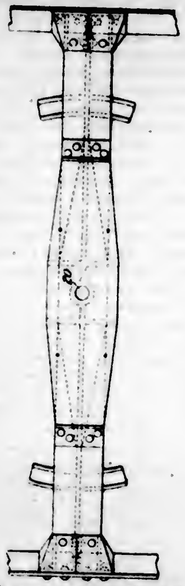
6. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the top of the center sill and beneath the side sills, a continuous channel compression member passing beneath the center sill and secured to the bottoms of the side sills, said channel having depending flanges, and braces connected to the channel compression member and the center sill; substantially as described.

7. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the top of the center sill and beneath the side sills, a continuous channel compression member passing beneath the center sill and secured to the bottoms of the side sills, said channel having depending flanges, and braces connected to the top tension member and the upper portion of the side sills; substantially as described.

8. In a railway-car, the combination with a center sill and side sills, of a flat plate tension member passing over the top of the center sill and beneath the side sills, a continuous channel compression member passing beneath the center sill and secured to the bottoms of the side sills, said channel having depending flanges, braces connected to the channel compression member and to the center sill, and braces connected to the top tension member and the upper portion of the side sills; substantially as described.

9. In a railway-car, the combination with the channel center-sill members having outwardly-turned flanges, a diaphragm 5 interposed between the channel center-sill members, angles connected to the diaphragm and to the center-sill members, a flat plate tension member passing over the center sill and extending from side sill to side sill, a channel compression-member passing beneath the center sill and extending from side sill to side sill, braces connected to the channel compression member and to the center sill, braces connected to the tension member and to the upper portion of the side sills, and connecting-plates carried by the ends of the compression and tension members and secured to the bottoms of the respective side sills; substantially as described.

809,786. BOLSTER. ALLEN H. OSTRANDER, Paterson, N. J., assignor to American Car & Foundry Company, St. Louis, Mo., a Corporation of New Jersey. Filed Aug. 24, 1905. Serial No. 275,644.



Claim.—1. In a railway-car, the combination with side sills, of a cast bolster having a continuous lower member projecting beneath the side sills and secured thereto, the portions of said lower member which project beneath the side sills being deflected downwardly; substantially as described.

2. In a railway-car, the combination with side sills, of a cast bolster having an upper member deflected upwardly from its central portion and having its opposite ends deflected downwardly, a continuous lower member extending beneath the side sills and secured thereto, and connections between the upper member and the side sills; substantially as described.

3. In a railway-car, the combination with side sills, comprising members having inwardly-disposed flanges, of a cast bolster having a central vertical web and top and bottom members the lower member being secured to the under side of the inwardly-disposed flanges of the side sills, and fastening devices arranged in pairs and connecting the respective ends of the webs and top members of the bolster to the vertical portions of the angle side sills; substantially as described.

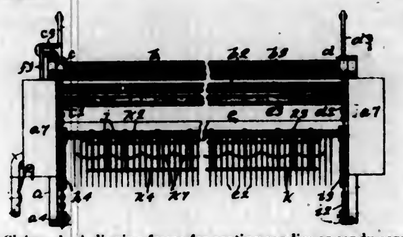
4. A cast-steel bolster having a vertical web provided with transversely-extending reinforcing-ribs and tapered longitudinally-extending reinforcing-ribs connected therewith and top and bottom members, the bottom member extending beyond the ends of the web and the ends of the top member being deflected downwardly; substantially as described.

5. A cast-steel bolster having a web and top and bottom members, of pressed-steel fastening devices connected to the web and to the top member of the bolster and the sides of the car, and rivets passing through the side members of the car and the bottom member of the bolster; substantially as described.

6. A cast-steel bolster having top and bottom members and a web connecting them, and fastening devices for securing the ends of the bolster to the car side, said fastening devices having means for engagement with the upper member of the bolster and the web; substantially as described.

7. The combination with the side sills of a car, of a body-bolster having upper and lower members, and fastening devices for connecting the bolster to the car sides and arranged in pairs with webs back to back, parts of the webs being secured together and parts being spaced apart to receive the web of the bolster, said fastening devices also engaging the upper member of the bolster; substantially as described.

809,787. DIPPING-FRAME FOR COATING CANDIES. PANAYIOTIS PANOUSIAS, New York, N. Y. Filed May 6, 1905. Serial No. 259,114.



Claim.—1. A dipping-frame for coating candies or candy-cores provided with a horizontally-movable open-work candy-support, a rotatable open-work holder mounted thereover, and spacing and marking devices suspended from the support of the rotatable holder, substantially as shown and described.

2. A dipping-frame for coating candies or candy-cores provided with a horizontally-movable open-work candy-support, a rotatable open-work holder mounted thereover, spacing and marking devices suspended from the support of the rotatable holder, and means for moving said support upwardly and forwardly, substantially as shown and described.

3. A dipping-frame for coating candies or candy-cores, comprising rigidly-connected end members, a horizontally-movable open-work candy-support in the bottom portion thereof, a rod mounted longitudinally of said frame and provided with L-shaped guides in the end portions thereof whereby said rod may be moved upwardly and forwardly or backwardly and downwardly, a rotatable open-work candy-holder connected with said rod and spacing and marking devices suspended from said rod, substantially as shown and described.

4. A dipping-frame for coating candies or candy-cores, comprising rigidly-connected end members, a horizontally-movable open-work candy-support in the bottom portion thereof, a rod mounted longitudinally of said frame and provided with L-shaped guides in the ends thereof whereby said rod may be moved upwardly and forwardly or backwardly and downwardly, a rotatable open-work candy-holder connected with said rod and spacing and marking devices suspended from said rod, and means for operating said candy-support and said rod, substantially as shown and described.

5. A dipping-frame for coating candies or candy-cores comprising rigidly-connected end members provided with horizontal slots in the bottom portion thereof, an open-work candy-support movable in said slots, said end members being also provided with slots which range upwardly and forwardly or backwardly and downwardly, a rod mounted in said slots and adapted to move therein, an open-work candy-holder rotatably connected with said rod, spacing and marking devices suspended from said rod, and means for moving the open-work candy-support forwardly and backwardly and for operating said rod in the slots in which it is mounted, substantially as shown and described.

6. A dipping-frame for coating candies or candy-cores, provided with a horizontally-movable candy-support, comprising a bar having forwardly-directed needles or pins, a rod mounted over said bar and movable upwardly and forwardly and backwardly and downwardly, an open-work candy-holder rotatably connected with said rod and spacers and markers rigidly connected with and suspended from said rod, substantially as shown and described.

7. A dipping-frame for coating candies or candy-cores, provided with a horizontally-movable candy-support, comprising a bar having forwardly-directed needles or pins, a rod mounted over said bar and movable upwardly and forwardly and backwardly and downwardly, an open-work candy-holder rotatably connected with said rod and spacers and markers rigidly connected with and suspended from said rod, and means for operating said candy-support and said rod comprising a rotatable shaft mounted longitudinally of the bottom portion of the frame, an arm connected with one end thereof and provided with angular slots in which the ends of said bar operate, another rotatable rod mounted in the top portion of said frame, means whereby the last-named rod may be operated by said arm, and devices connected with the last-named rod for moving the rod with which the candy-holder and candy spacers and markers are connected, substantially as shown and described.

8. A dipping-frame for coating candies or candy-cores, said frame being provided with end handles, a forwardly and backwardly movable open-work candy-support, a rotatable open-work candy-holder mounted over said support and movable upwardly and forwardly and backwardly and downwardly, and spacing and marking devices connected with the support of the open-work candy-holder and movable therewith, substantially as shown and described.

9. A dipping-frame designed for use in coating candies or candy-cores, said frame being provided with rigidly-connected end members, a horizontally-movable candy-support mounted in the bottom thereof and extending longitudinally thereof and provided with forwardly-directed needles or pins, a rod mounted longitudinally of the frame over the candy-support and movable upwardly and forwardly and backwardly and downwardly, an open wire-work candy-holder connected with said rod and spacing and marking devices suspended from said rod, substantially as shown and described.

10. A dipping-frame designed for use in coating candies or candy-cores, said frame being provided with rigidly-connected end members, a horizontally-movable candy-support mounted in the bottom thereof and extending longitudinally thereof and provided with forwardly-directed needles or pins, a rod mounted longitudinally of the frame over the candy-support and movable upwardly and forwardly and backwardly and downwardly, an open wire-work candy-holder connected with said rod, and spacing and marking devices suspended from said rod, said spacing and marking devices being spoon-shaped in cross-section and provided in their lower back portions with recesses, substantially as shown and described.

11. A dipping-frame for use in coating candies or candy-cores provided with a horizontally-movable candy-support, comprising parallel needles or pins, an open-work candy-holder mounted thereover and movable upwardly and forwardly or backwardly and downwardly, and candy spacing and marking devices suspended from the support of the rotatable candy-holder, substantially as shown and described.

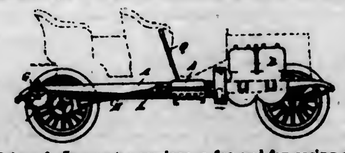
12. In a dipping-frame for coating candies or candy-cores, a horizontally-movable open-work candy-support mounted in the bottom portion of said frame, a rod mounted in the end portions of said frame and extending longitudinally thereof over the candy-support and movable in L-shaped guides formed in the ends of said frame, a rotatable rod mounted in the top back portion of said frame and provided with end arms, chains connected with said arms and with the opposite ends of said first-named rod, said chains being passed around roller-guides arranged forwardly and backwardly of the opposite ends of said first-named rod, means for operating the rotatable rod, a rotatable open-work candy-holder connected with the first-named rod and candy spacers and markers suspended from said first-named rod, substantially as shown and described.

13. A dipping-frame for coating candies or candy-cores, provided with a longitudinally-arranged and forwardly and backwardly movable candy-support, and spacing and marking devices suspended over said support longitudinally thereof, substantially as shown and described.

14. A dipping-frame for coating candies or candy-cores, provided with a longitudinally-arranged open-work candy-support, means for moving said support forwardly and backwardly, and means for holding candies on said support while the latter is being agitated, substantially as shown and described.

15. A dipping-frame for coating candies or candy-cores, said frame being provided with a forwardly and backwardly movable open-work candy-support, spacing and marking devices arranged thereover and means for holding the candies on said support, while the latter is being agitated, substantially as shown and described.

809,788. DUST-ALLAYER FOR AUTOMOBILES. WILLIAM H. PARKER, Royalsok, Mich. Filed Mar. 11, 1905. Serial No. 249,868.



Claim.—1. In a motor-carriage, a fan and fan-casing disposed in the rear thereof, said fan-casing having a longitudinal opening

transverse to the line of travel of said carriage and adapted to deliver forcibly a sheet of air through said opening, means for varying the opening of said fan-case, and means for driving said fan connected with the propelling means of said carriage, substantially as described.

2. In combination with a road-carriage, a fan and fan-case disposed in the rear thereof and transversely to the line of travel thereof and adapted to deliver a sheet of air rearwardly, connecting means for driving said fan in said casing, said means being driven from the propelling-engine of said vehicle, and means for disconnecting said fan from said propelling-engine, substantially as described.

3. The combination with the running-gear of a traveling carriage, a fan and fan-case disposed at the rearward end thereof and adapted to deliver a sheet of air rearwardly, means upon said fan-case whereby the direction of the delivery of said air may be controlled and means for driving said fan in said fan-case, substantially as described.

809,739. ADHESIVE AND PROCESS OF MAKING SAME. FREDERICK H. PAYNE, Richmond, Va. Filed Apr. 14, 1905. Serial No. 255,659.

Claim.—1. The process of making an adhesive from evaporated sulfite liquor which consists in combining therewith a mixture of oil and resin, substantially as set forth.

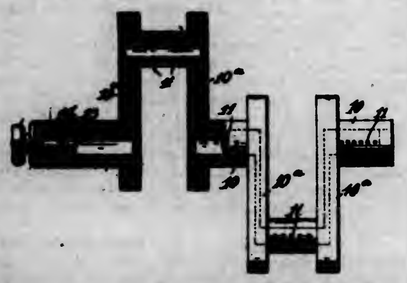
2. The process of making an adhesive from evaporated sulfite liquor which consists in mixing a quantity of resin with a quantity of oil until the mixture is of substantially the same specific gravity as the sulfite and then mixing said mixture with said sulfite, substantially as set forth.

3. An adhesive composed of sulfite liquor combined with a mixture of oil and resin, substantially as set forth.

4. An adhesive consisting of a mixture of sulfite liquor, oil and resin in substantially the proportions set forth.

5. The process of treating evaporated sulfite liquor which consists in mixing therewith a quantity of oil, which has previously been combined with a substance that will combine with said sulfite, substantially as set forth.

809,740. LUBRICATOR FOR CRANK AND SIMILAR SHAFTS. THOMAS S. PATTERSON, New York, N. Y. Filed Jan. 4, 1904. Renewed Nov. 15, 1905. Serial No. 287,622.



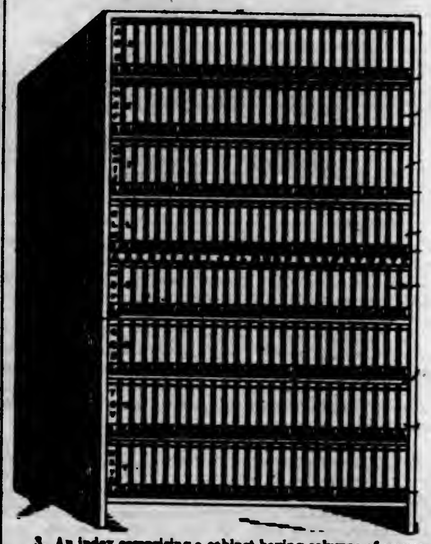
Claim.—1. As an improved article of manufacture, a crank-shaft having a bore extending from end to end, the said bore being reduced in the crank-arms and continuing through the crank-pins and the shaft being provided with outlet-ports at its bearing-points, the said ports gradually increasing in number as the distance from the filling end of the shaft increases.

2. As an improved article of manufacture, a crank-shaft having a longitudinal bore extending from end to end, the bore being largest in the main portions of the shaft, smaller through the crank-pins and still smaller through the crank-arms and the shaft being provided at its bearing-points with outlet-ports.

809,741. CABINET-INDEX. CHARLES H. PAYNE, Milligan, Tenn. Filed June 20, 1904. Serial No. 213,717.

Claim.—1. The combination with a cabinet having columns of compartments, each column being designated by a letter of the alphabet, and a compartment of each column being designated by a letter of the alphabet forming the second letter of recorded words; of volumes within said compartments and in which the words are recorded, said volumes being indexed according to the third letters of the words therein.

2. An index comprising a cabinet having columns of compartments therein, the columns being designated by different letters of the alphabet, tabs secured to one wall of each compartment and containing letters of the alphabet designating the second letters of recorded words adapted to be placed within the compartment, and indexed recorded words within each compartment, said words being indexed according to their third letters.



3. An index comprising a cabinet having columns of compartments therein, said columns being designated by different letters of the alphabet, a flexible tab secured within each compartment, each tab containing letters of the alphabet designating the second letters of recorded words adapted to be placed within said compartment, a volume in each compartment having words recorded therein and indexed according to the third letters of the words, a device secured to the front end of each volume and projecting from the cabinet and adapted to be grasped, and a flexible connection between each volume and one wall of its compartment.

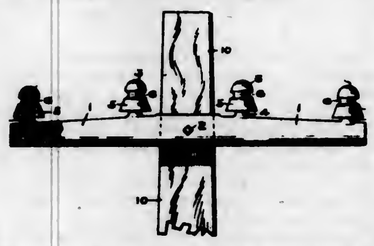
809,742. STORAGE-BATTERY PLATE. DAVID P. FERRY, Chicago, Ill. Filed June 2, 1903. Serial No. 159,457.

Claim.—1. As an article of manufacture, a storage-battery grid, comprising three flat superimposed lead members, the two outer members being provided with a plurality of vertically-disposed columns of obliquely-arranged outwardly-tapering apertures, the obliquely-arranged apertures of one member being arranged at an angle to the obliquely-arranged apertures of the other member, and the intermediate member being provided with evenly-distributed small openings or perforations.

2. As an article of manufacture, a storage-battery grid having its opposite sides provided with parallel and obliquely-arranged outwardly-tapering pockets arranged in a plurality of vertically-disposed columns, the pockets at one side being arranged at an angle to the pockets at the other side, and having also a perforated web separating the pockets at one side from the pockets at the other side.

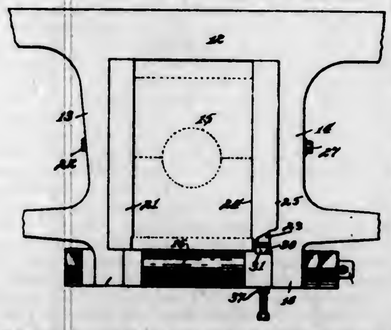
3. As an article of manufacture, a storage-battery grid composed of superimposed plates having upwardly-extending projections adapted to form a terminal for the battery-plate, and having also strengthening or reinforcing portions tapering downwardly from said terminal.

809,743. CROSS-ARM FOR CARRYING HIGH-TENSION WIRES. EVAN B. P. PEFFERT, Indianapolis, Ind., assignor of one-half to Samuel Bowser, Indianapolis, Ind. Filed Aug. 19, 1904. Serial No. 221,340.



Claim.—The combination with a support, of a cross-arm made entirely of glass, said arm having holes for bolting the same to the pole, and said arm having integral vertical pins terminating with integral insulator-knobs, said knobs having circumferential grooves, and downwardly and outwardly flaring flanges integral with the knobs between the grooves and the arm.

809,744. LOCOMOTIVE-PEDESTAL. FREDERICK H. RANDELL, Waterville, Me. Filed Oct. 7, 1905. Serial No. 281,747.



Claim.—1. In a pedestal, the combination with the side member and a bearing-box, of a shoe arranged to engage the side of the bearing-box, and a wedge member arranged between the shoe and the side member.

2. In a pedestal, the combination with the side member and the bearing-box, of a shoe arranged to engage the side of the bearing-box, a wedge member arranged between the shoe and the side member, and means for adjusting the wedge member.

3. In a pedestal, the combination with the side member and a bearing-box, of a shoe arranged to engage the side of the bearing-box, a wedge member arranged between the shoe and the side member, means for adjusting the wedge member, and means for preventing vertical movement of the shoe.

4. In a pedestal, the combination with the bearing-box, of a shoe arranged to engage the side of the bearing-box, and a wedge member arranged between the shoe and the side of the pedestal, each side of the pedestal being inclined.

5. In a pedestal, the combination with the side member and a bearing-box, of a substantially channel-shaped shoe arranged to engage the side of the bearing-block, and a wedge inserted between the shoe and the pedestal.

6. In a pedestal, the combination with the side member and a bearing-box of a substantially channel-shaped shoe arranged to engage the bearing-box by its flat side with the side portions embracing the side member, and a wedge member inserted in the channeled portion of the shoe and engaging the shoe and side member with its opposite converging sides, the wedge being substantially rectangular in section.

7. In a pedestal, the combination of a side member having an inclined face, a bearing-box, a substantially channel-shaped shoe arranged to engage the bearing-box by its flat side with the channeled portions embracing the side of the bearing-box, and a wedge member inserted in the channeled portion of the shoe and engaging the shoe and said side member with its opposite converging sides, the wedge being substantially rectangular in section.

8. In a pedestal, the combination with the side member and a bearing-box, of a shoe arranged to engage the side of the bearing-box, a wedge member arranged between the shoe and the side member, means for adjusting the wedge member, the side of the pedestal having a transverse aperture, the shoe having a threaded aperture registering with said aperture in the side member, the wedge having a vertically-extending slot registering with said apertures, and a bolt passing through the side member and wedge and tapped into the shoe.

9. In a pedestal, the combination with a bearing-box and a wedge located between the side of the box and the side member, of a pedestal, the bottom portion of the pedestal having a bore therein registering with the lower end of the wedge, a plate located on top of the lower member and having a threaded aperture registering with said aperture in the latter member, and an adjusting-bolt passing through said registering apertures and engaging the wedge.

10. In a pedestal, the combination with a bearing-box, a wedge located between the bearing-box and the side member of the pedestal, of a transverse brace at the bottom of the pedestal having a vertical aperture in alinement with the end of the wedge, the brace having a slotted portion around said aperture in its upper face, a plate having a threaded aperture and fitted into said slot with the aperture registering with said aperture in the brace, and a bolt passing through said registering apertures and engaging the wedge.

11. In a pedestal, the combination with a bearing-box, and a wedge located between the bearing-box and the side member of the pedestal, of a transverse brace at the bottom of the pedestal provided with vertical apertures disposed in alinement with the bottom of the wedge, the brace having a transverse slotted portion in its top including said apertures, a plate located in the slotted portion of the brace and provided with threaded apertures registering with said apertures, and bolts located in said registering apertures and engaging the wedge.

12. In a pedestal, the combination with the side member and a bearing-box, of a shoe arranged to engage the side of the bearing-box, a wedge located between the shoe and the side member of the pedestal, the bottom portion of the pedestal having a bore therein registering with the lower extremity of the wedge, and a plate having a threaded aperture and located on top of the lower member and registering with said aperture in the latter member, and an adjusting-bolt passing through the aperture in the lower member, and threaded through the aperture in said plate engaging the said wedge.

13. In a pedestal, the combination of a side member having an inclined face, a bearing-box, a substantially channel-shaped shoe arranged to engage the bearing-box by its flat side with the channeled portions embracing the side of the bearing-box, a wedge member inserted in the channeled portion of the shoe and engaging the shoe and said side member with its opposite tapering sides, the wedge being substantially rectangular in section, the bottom member of the pedestal having a bore therein registering with the lower extremity of the wedge, a plate located on the bottom member and having a threaded aperture registering with said aperture in the latter member, and an adjusting bolt passing through said registering apertures.

14. In a pedestal, the combination with the side member and a bearing-box, of a shoe arranged to engage the side of the box, a wedge located between the bearing-box and the shoe, a transverse brace at the bottom of the pedestal provided with vertical apertures disposed in alinement with the bottom of the wedge, the brace having a transverse slotted portion in its top including said apertures, a plate located in the slotted portion of the brace and provided with threaded apertures registering with said apertures, and bolts located in said registering apertures and engaging the wedge.

809,745. HARNESS SNAP AND SLIDE. [illegible]

809,745. HARNESS SNAP AND SLIDE. JOHN RIEDERER, Racine, Wis. Filed Mar. 3, 1905. Serial No. 248,196.

Claim.—1. In combination a slide having side ears with rigid projecting trunnions, and a snap-hook having its shank provided with a U-shaped cross-head comprising the transverse portion and the upwardly-extending arms at their extremities formed with bearing-openings, said arms extending up at the side faces of said ears and said bearing-openings loosely receiving said trunnions.

2. In combination, a breast-strap slide having side walls, and a hook having a U-shaped cross-head comprising upwardly-elongated side arms with their upper ends arranged at the side faces of said walls, said arms and walls having trunnions and bearing-openings, whereby the slide and hook are pivotally joined to rock on an axis transversely of the slide.

3. A breast-strap slide having a bottom strap-receiving surface and side ears provided with alined outwardly-projecting trunnions, the axial line of said trunnions being adjacent said strap-receiving surface, in combination with a snap-hook having a U-shaped head, the upper ends of the arms of which have bearing-openings receiving said trunnions, substantially as described.

4. A breast-strap slide having depending side ears formed with outwardly-projecting trunnions, in combination with a snap-hook having a U-shaped head, the upper ends of the arms of which having bearing-openings receiving said trunnions, substantially as described.

809,746. HOSE-COUPLING. SAMUEL M. RHOADS, Philadelphia, Pa. Filed May 20, 1905. Serial No. 261,200.

Claim.—1. A coupling comprising interlocking sections, one of said sections having a portion to fit within the other, a gasket within the latter section disposed to form a space for the reception of said portion and to bear against the inner face thereof, interconnecting valve and valve-operating devices carried by the respective sections, and means for maintaining the valve in closed position when the sections are separated, the valve-operating section being adapted to open the valve when the sections are connected and being provided with air-passages for the escape of fluid-pressure to act upon the gasket, substantially as described.

2. A coupling comprising interlocking male and female members, the male member being provided with a projection to enter the female member, a gasket within the female member adapted to bear against said projection, a valve axially arranged within the male member, an axially-arranged valve-operating device arranged within the female member, said operating device being adapted to engage and turn the valve to open or closed position when the members are connected or disconnected, the valve-operating device being provided with ports for the escape of fluid to subject the gasket at all times to fluid-pressure.

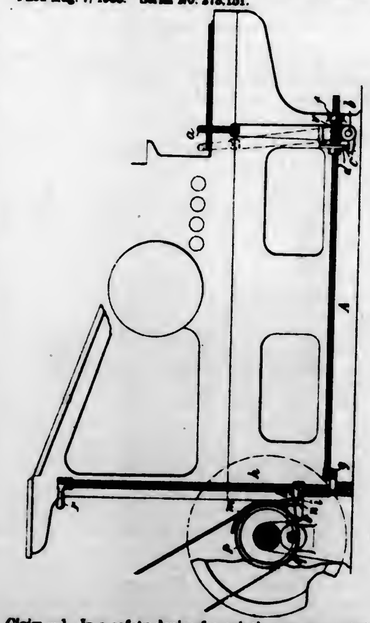
3. A coupling comprising male and female members provided with interlocking means adapted to be engaged and disengaged by a longitudinal and rotary movement of one member relative to the other member, the male member being provided with a projection to enter the female member, a valve-casing axially disposed within the male member and provided with ports, a rotary valve disposed within said casing and provided with cooperating ports and an outer coupling end, means for maintaining the valve in adjusted position, a gasket within the female member adapted to bear against the projection on the male member, and an axially-arranged valve-operating device disposed within the female member provided with an interlocking portion to engage the valve, and with ports for the passage of fluid to place the gasket under pressure, said valve and valve-operating device being thrown into and out of coupling engagement by the longitudinal movement of one section upon the other section and actuated to open or close the valve by the rotary movement of one section upon the other section.

809,747. HANGER OR BAR FOR OVERHEAD ELECTRIC TROLLEY-WIRES. ABRAHAM RICHARDSON and THOMAS S. JONES, Blackpool, England, assignors of six-eighths to Joseph Heap, Henry Heap, James Bailey, Thomas Brierley, Robert Billington, and James Haydock, Blackpool, England. Filed Feb. 6, 1905. Serial No. 244,274.

Claim.—1. An ear or hanger for supporting or holding up electric conductor-wires constructed with two jaws to grip the wires, upwardly-extending shanks to said jaws with an inclined recess a loose nut placed in the said recess, a collar placed over the shanks and the insulator-bolt fitting into the nut and a flange thereon abutting against the collar to draw the nut up and force the collar down substantially as described.

2. In an ear or hanger the combination with the jaws A and B provided with shanks D and formed with an inclined recess *d* of the loose nut H placed thereon, the collar E fitting over the shanks, and the insulator-bolt G engaging with the nut H to draw the nut up and force the collar down over the shank substantially as described and shown.

809,748. SAFETY DEVICE FOR TWO-REVOLUTION PRINTING-PRESSES. MAX ROCKSTROH, Dresden-Heidenau, Germany. Filed Aug. 7, 1905. Serial No. 273,151.

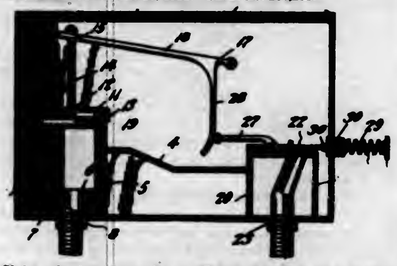


Claim.—1. In a safety device for printing-presses, a belt-shifting device having a braking device, a throw-off lever having an arm projecting over the form of the machine and pivotally mounted to the frame thereof, and a spring-controlled rod connected to the belt-shifting device and adapted to be actuated by the throw-off lever.

2. In a safety device for printing-presses, a throw-off lever having an arm projecting over the form of the latter, a belt-shifting element having a braking device for the fly-wheel of the press, a spring-controlled rod engaging the belt-shifting element, and means for setting the rod in an operative position, said throw-off lever maintaining the rod in a set position and adapted to release the same when the hand of the operator is brought in contact therewith.

3. In a printing-press, a safety device including a throw-off lever adapted to extend over the face of the form of the press, a belt-shifting device, a brake member cooperative with the latter for arresting the fly-wheel of the press, a spring-actuated rod connected with the belt-shifting element, and a hand-operable lever for setting the rod in an operative position, said throw-off lever adapted to release the rod for operating the belt-shifting element and brake member when the hand of the operator contacts with said throw-off lever.

809,749. AUTOMATIC CUT-OFF. HOWE G. ROSS and JAMES R. ROSS, Empire, Ohio, assignors of one-third to Fred G. Porter, Wellsville, Ohio. Filed June 27, 1905. Serial No. 267,268.



Claim.—1. An automatic cut-off comprising a casing provided with an inlet-port and an outlet-port, a guide arranged on each side of the outlet-port, a valve mounted within said guides for horizontal movement and provided with an arm, means controlled by gas-pressure and normally engaging the arm of said valve, said means being adapted to move and retain the valve over the outlet-port when and during the time the gas-pressure is cut-off, and to be moved out of the path of said arm by the gas-pressure when reëstablished.

2. An automatic cut-off comprising a casing provided with an inlet-port and an outlet-port, a guide arranged on each side of the outlet-port, a valve mounted within said guides for horizontal movement and provided with an arm, an L-shaped lever mounted within the casing and having one of its ends disposed to normally engage the arm of the valve, means having connection with said L-shaped lever and controlled by gas-pressure, said means being adapted to rock the L-shaped lever, whereby to move and retain the valve over the outlet-port when and during the time the gas-pressure is cut off, and to be operated to move the said L-shaped lever out of engagement with the arm of the valve by the gas-pressure when reëstablished, and means independent of the first-named means by which the valve may be moved to open the outlet-port after the reëstablishment of the gas-pressure.

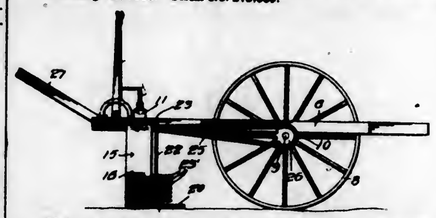
3. An automatic cut-off comprising a casing provided with an inlet-port and an outlet-port, a valve for said outlet-port and adapted for movement in a horizontal direction, means controlled by gas-pressure and normally engaging said valve, said means being adapted to move and retain the valve over the outlet-port when and during the time the gas-pressure is cut off, and to be moved out of the path of said valve by the gas-pressure when reëstablished, and means independent of the first-named means by which the valve may be moved to open the outlet-port after the reëstablishment of the gas-pressure.

4. An automatic cut-off comprising a casing provided with an inlet and an outlet port, a valve for said outlet-port and adapted for movement in a horizontal direction, a lever mounted within the casing and normally engaging said valve, means controlled by gas-pressure and having engagement with said lever, said means being adapted to operate the lever to move and retain the valve over the outlet-port when and during the time the gas-pressure is cut off, and to be moved to withdraw the lever from engagement with said valve by the gas-pressure when reëstablished, and means independent of the first-named means by which the valve may be operated to open the outlet-port after the reëstablishment of the gas-pressure.

809,750. SAFETY DEVICE FOR SCARF-PINS. HERMAN B. ROSENBLUM, New York, N. Y. Filed May 11, 1905. Serial No. 259,952.

Claim.—A pin provided near the pointed end thereof and in one side thereof with a longitudinal groove having a transverse keeper, and a short slide mounted in said groove and held therein by said keeper, said slide being movable longitudinally in said groove and the ends thereof being so formed as to prevent its removal from said groove, either end of said slide being adapted to be projected by the longitudinal movement thereof in the direction of said end, substantially as shown and described.

809,751. BEAN-HARVESTER. CARL RUEHLE, Orangeville, Ill. Filed Aug. 10, 1905. Serial No. 273,569.



Claim.—1. An implement of the class described comprising a longitudinal beam having a broadened portion intermediate of its ends and having a longitudinal slot in the broadened portion, brackets carried by the broadened portion, an axle revolubly mounted in the brackets, a wheel mounted upon the axle for rotation therewith and extending through the slot, pulling mechanism carried by the rearward portion of the beam, beaters carried by the pulling mechanism, and connections between said beaters and the axle for operation of the former when the latter is revolved.

2. An implement of the class described comprising a longitudinal beam, transverse beams hinged at their inner ends to the longitudinal beam adjacent to the rearward end thereof, rotatable plant-beating mechanisms carried by the beams, a ground-wheel, connections between the ground-wheel and the beating mechanism for operation of the latter when the ground-wheels are revolved, and means for moving the transverse beams upon their hinges to bring the beating mechanisms into and out of operative position.

3. An implement of the class described comprising a beam, laterally-extending beams carried by the first-named beam and each having a plurality of openings therein, pairs of arcuate plates disposed with their concave surfaces toward each other and having stems at their upper ends removably engaged in the openings, the lower ends of the plates of each pair lying in close relation, the inner plate of each pair having a bearing therein, a shaft journaled in said bearing, plates carried by the second-named beams and in which the upper ends of the shafts are revolubly engaged, laterally-extending fingers carried by the shafts and arranged to engage plants disposed between the plates, guides carried by each pair of plates and arranged to direct plants between the plates, a shaft journaled upon the first-named beam, connections between said shaft and the first-named shafts for simultaneous rotation thereof, and a ground-wheel carried by the second-named shaft.

809,752. SALUTE-GUN. WALTER D. RYAN, West Lynn, Mass. Filed Apr. 28, 1904. Serial No. 204,562.

Claim.—1. The combination in a salute-gun of a structure having a main passage, and a branch passage formed in two parts out of line with each other, a slide-valve having a passage and movable to bring said passage into line with one or other of the parts of the branch passage, and a plunger movable in the main passage for operating the valve and exploding a cartridge, substantially as described.

2. The combination in a salute-gun of a structure provided with two passages opening into a common chamber in different lines, a valve in said chamber having a passage and movable to bring said passage in line with either of said other passages, a spring active on said valve, with a plunger for moving the valve in opposition to said spring, substantially as described.

3. A toy including an elongated tubular body, a plunger therein, a magazine for cartridges, a valve movable by the plunger for successively delivering cartridges from said magazine to the tubular

body and a spring independent of the plunger and directly operative

body and a spring independent of the plunger and directly operative upon the valve, said spring tending to move said valve in opposition to the plunger, substantially as described.

4. A toy including a plunger, a structure having an exploding-chamber placed to be entered by the plunger, a magazine, a spring, and a valve actuated thereby independently of said plunger, said valve being movable by the plunger in opposition to said spring and being placed to receive cartridges from the magazine and deliver the same to said exploding-chamber, substantially as described.

5. The combination of a tubular body having its bore provided with a striking-plate, a plunger movable within the bore, a valve mechanically independent of the plunger and of the body, having a portion projecting into said bore so as to be engaged and actuated by the plunger, a spring directly operative upon the valve to move it in opposition to the plunger, and a magazine, said valve being formed to receive a cartridge from the magazine and deliver the same to the bore of the body, and both the plunger and said body being extended so as to permit one of the same being held in position while the other is operated, substantially as described.

6. The combination of a tubular body having within it a branched passage, a magazine, a spring-actuated valve having an opening normally in communication with one branch of said passage, with a plunger in the other branch of the passage and placed to engage the valve to move it in opposition to its spring so that its opening will communicate with the magazine, substantially as described.

7. The combination of a tubular structure having a plunger and a valve having a beveled end projecting into the path of the plunger, a spring tending to retain the valve in such position, and a magazine, said valve having an opening which communicates with the magazine when the valve projects into the path of the plunger and with the bore of the tubular structure when said valve is moved back by the plunger, substantially as described.

8. The combination of a tubular body having a magazine attached to its side and provided with a chamber communicating with said magazine and with its bore, a valve in said chamber having through it a passage, a spring normally holding the valve so that its passage connects with the bore of the body, and a plunger in the body for moving the valve so that its passage connects with the magazine, substantially as described.

9. The combination of a tubular body having a transverse opening at its lower end, a plunger movable in the body, a valve carried by the body and movable by the plunger in a straight line substantially at right angles thereto, means in addition to the plunger for positively moving said valve and a magazine connecting with the valve-chamber, there being a passage from the valve-chamber entering the bore of the body between the valve and the transverse opening at the lower end thereof, substantially as described.

10. The combination of a tubular body having a metallic end section, and provided with a chamber connecting with its bore, a plunger movable in the body and in said section, a valve movable in the chamber of the body and provided with an inclined portion, and means for normally holding said portion of the valve in the path of said plunger, said valve having in it an opening normally connecting with the passage from the bore of the body, substantially as described.

11. The combination of a tubular body having a magazine, a valve, and a plunger for causing the valve to successively connect with the magazine and the tubular bore of the body, said valve being movable in a line substantially at right angles to the line of the plunger and being placed to be engaged by the end of the same, substantially as described.

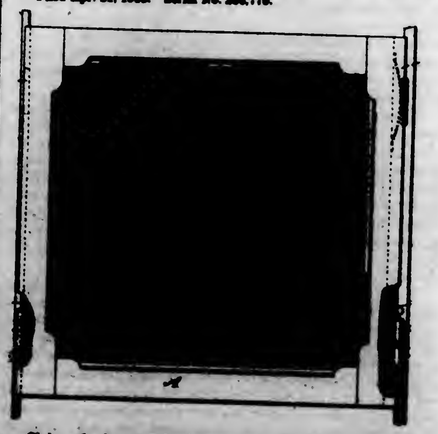
12. The combination in a salute-gun of a body having two communicating passages extending adjacent to each other, a magazine connected to one passage, a plunger in the other passage and a valve having portions normally extending into both passages, said valve being placed to be moved by engagement with the end of the plunger, substantially as described.

13. The combination of a tubular body having in it two passages, a plunger in one passage, a magazine connected to the other, and a valve operated by the plunger normally extending into both passages, the portion of said valve which extends into the plunger-passage being inclined to the line of movement of said plunger, and the plunger and magazine being adjacent to each other on the same side of the valve when said plunger is in its raised position, substantially as described.

14. The combination of a tubular body having in it two passages, a plunger in one passage, a magazine connected to the other, and a valve normally extending into both passages, the portion of said valve which extends into the plunger-passage being inclined to the line of movement of said plunger, with a spring tending to retain said inclined portion of the valve projected into the plunger-passage, substantially as described.

15. The combination of a tubular body provided with a striking-plate, a plunger movable within the bore of said body, a valve operated by engagement with the end of the plunger, a spring acting directly on the valve and tending to move it in opposition to the plunger, and a magazine, said valve being formed to receive a cartridge from said magazine and deliver the same to the bore of the tubular body, and said body and the plunger being both of relatively great length so as to permit of one of the same being held while the other is operated, substantially as described.

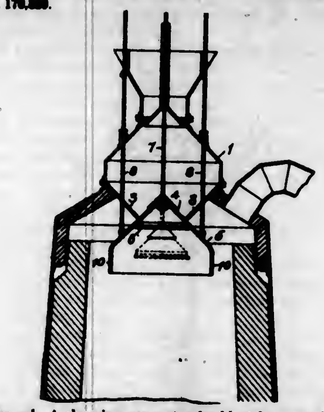
809,758. WINDOW-SCREEN. EUGENE D. SEGAR, Randolph, Vt., assignor to Porter Screen Manufacturing Company, Burlington, Vt. Filed Apr. 21, 1905. Serial No. 256,770.



Claim.—1. A screen having grooved side bars adapted to run upon rails, a metallic bowed spring-strip arranged in one of the grooves, and a shoe of ⊔ cross-section, mounted upon and secured to the summit of the bowed spring-strip, in such manner as to be capable of slight fore-and-aft tilting movement thereon, as and for the purposes hereinbefore set forth.

2. A screen having grooved side bars adapted to run upon rails, a metallic bowed spring-strip having nicks in its side edges arranged in one of the grooves and a bearing-shoe of ⊔ cross-section mounted on the summit of the bowed spring-strip having integral side prongs bent over the side edges, and interned onto the under side of the spring-strip, and seated in said nicks, substantially as hereinbefore set forth.

809,754. CHARGING APPARATUS FOR BLAST-FURNACES. GIDEON C. BRACKENRIDGE, Allegheny, Pa. Filed Aug. 26, 1903. Serial No. 170,220.



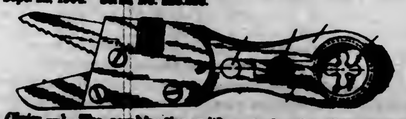
Claim.—1. A charging apparatus for blast-furnaces, having in combination a feed-hopper, a distributing-bell arranged below the hopper, and having an opening in line with and of a diameter not less than the diameter of the opening in the hopper, means for raising and lowering the distributing-bell, a main bell adapted to close the openings in the hopper and distributing-bell, and movable through the latter to closed or normal position, substantially as set forth.

2. A charging apparatus for blast-furnaces having in combination a feed-hopper, a main bell closing said hopper, a distributing-bell having an opening in line with and of a diameter not less than the diameter of the opening in the hopper and connected with the main bell, whereby its movement from the hopper is controlled by the main bell and means for raising and lowering said bells, substantially as set forth.

3. A charging apparatus for blast-furnaces having in combination a feed-hopper, a distributing-bell having an opening in line with and of a diameter not less than the diameter of the opening in the hopper, means for raising and lowering the distributing-bell, a main bell adapted to close the hopper and when lowered to direct the contents of the hopper through or over the distributing-bell, and means for raising and lowering the main bell, substantially as set forth.

4. A charging apparatus for blast-furnaces, having in combination a feed-hopper, a distributing-bell having an opening in line with and of a diameter not less than the diameter of the opening in the hopper and provided with a deflecting-curtain, means for raising and lowering the distributing-bell, a main bell adapted to close the hopper and to direct when lowered the contents of the hopper through or over the distributing-bell and means for raising and lowering the main bell, substantially as set forth.

809,755. TOOL. HENRY A. SMITH, Elgin, and WILLIAM F. FRENZ, Dundee, Ill.; said Frenz assignor of one-fourth to said Smith. Filed Sept. 22, 1904. Serial No. 225,452.



Claim.—1. The combination with a stock, of a die rotatably mounted thereon, a plate formed to hook over one end of said stock, means for additionally securing said plate to said stock, a spring-pressed dog mounted in a pocket formed in said plate and arranged to lock said die against rotation, and means for moving said dog out of locking position.

2. The combination of a support, a flanged die rotatably mounted thereon, an embossed plate removably secured to said support so as to clamp said die in place, a spring-pressed bolt mounted in said embossed plate and arranged to engage the periphery of said die at a plurality of points successively, so as to lock said die against rotation, and adapted to be disengaged from said die, so as to permit the rotation of said die with reference to said support and said plate.

3. An attachment for a tool-handle, provided with an opening therethrough, comprising a plate so formed as to hook over said handle, said to be also secured thereto by separate attaching means, combined with a spring-pressed bolt carried by said plate and adapted to have locking engagement with a die when mounted in said opening.

809,756. BAG-FASTENER. EDWIN G. STAUDE, Minneapolis, Minn. Filed Sept. 6, 1904. Serial No. 223,393.

Claim.—1. As a new article of manufacture, a bag-fastener consisting of a flexible ribbon having a rib on one side extending from end to end of the ribbon and formed by making a longitudinal depression or groove in the other side, and said ends being oppositely turned to form hooks and the rib on one hook entering the groove or depression in the other hook when they are placed together whereby lateral movement of one hook with respect to the other when the fastener is in use is prevented.

2. As a new article of manufacture, a bag-fastener consisting of a flexible metallic ribbon having a rib on one side extending from end to end along the middle line of the ribbon and formed by making a longitudinal depression in the other side, the ends of said ribbon being oppositely turned to form hooks that are adapted to interlock, substantially as described.

3. As a new article of manufacture, a bag-fastener consisting of a flexible ribbon adapted to be folded in a circular form around the closed mouth of a sack and having its ends oppositely turned to form hooks which interlock with one another when the fastener is in place on the sack, one of said hooks having a longitudinal rib to enter a correspondingly-arranged groove provided in the other hook whereby lateral movement of one hook with respect to the other is prevented, substantially as described.

4. As a new article of manufacture, a bag-fastener comprising a flexible ribbon of spring material adapted to be folded into a circular form around the closed mouth of the sack and having oppositely-turned ends to form hooks which interlock one with another when the fastener is in use, one of said hooks having a depression to receive a correspondingly-shaped elevation on the other hook whereby when the hooks are interlocked lateral movement of one with respect to the other will be prevented, substantially as described.

809,757. PLOW. SAMUEL H. STEELE, Canaan, Ind. Filed Jan. 18, 1904. Serial No. 189,503.

Claim.—An improvement of the character described comprising a frame, including a beam, sills secured against the side faces of the beam and diverging rearwardly beyond the rear end of the beam, said sills being reduced intermediate their ends in lateral thickness to form parallel portions, a shaft passing through the reduced portions of the sills, rollers mounted upon said shaft, one of the rollers being disposed between said sills and one roller adjacent the outer face of each sill, the intermediate roller being of greater length than

the end rollers, a blade bridging the rear ends of the aforesaid sills, cultivator-shovels secured to the sills between the blade and the aforesaid rollers, a supplemental beam secured upon and projecting slightly forwardly of the first-named beam and having means for attachment of draft appliances, posts upon the rear end portions of the sills, vertically-spaced braces secured transversely of the posts at the upper end of the latter, handles secured to the supplemental beam and passed rearwardly and upwardly between and attached to the side braces, and a shoe secured against the under side of the first-named beam and the adjacent portions of the sills, said shoe having an integral forward extension extending upwardly at its front edge and secured to the supplemental beam.

809,758. CIGAR-BUNCHING DEVICE. NICHOLAS THIELEN, Chicago, Ill. Filed Oct. 31, 1904. Serial No. 230,753.

Claim.—1. A cigar-bunching device comprising a split rod and means for securing both members thereof together, antifriction-rollers at the ends of said rod, an apron having a curved end, and a curved rod secured in said end, said curved rod being adapted to be straightened to be received in and clamped in said split rod, thereb throwing the middle portion of said apron forward to make same fuller at its middle portion than at its ends.

2. A cigar-bunching device, comprising in combination, a split rod having reduced threaded ends, antifriction-rollers journaled on said reduced ends nuts, engaging said ends to secure the two parts together, each member of said split rod being provided at its middle portion with a longitudinally-disposed groove and a recess extending from one edge of the groove to the adjacent edge of the member to provide a longitudinal slot in said rod when said members are fitted together, and an apron provided at one end with an inclosed rod adapted to be received in said grooves in said member to hold said apron against removal.

3. A cigar-bunching device, comprising in combination, a split rod having reduced threaded ends, antifriction-rollers journaled on said reduced ends, nuts engaging said ends to secure the two parts together, each member of said split rod being provided at its middle portion with a longitudinally-disposed groove and a recess extending from one edge of the groove to the adjacent edge of the member to provide a longitudinal slot in said rod when said members are fitted together, and an apron provided at one end with an inclosed rod adapted to be received in said grooves in said member to hold said apron against removal, said end of said apron being convex and the rod curved in accordance therewith, whereby when said rod is straightened to fit said grooves the middle portion of the apron will be thrown outwardly to provide greater fullness between the side edges thereof than at the said edges.

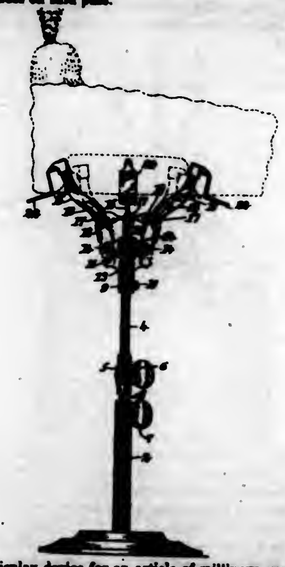
809,759. HOSE-COUPLING. RICHARD TOOLE and JOHN J. MCDONNELL, Portage, Pa. Filed Aug. 22, 1904. Serial No. 221,316.

Claim.—1. In a hose-coupling, the combination of a tubular member having a cone-shaped enlargement, a cone-shaped cup carried by said member, another member adapted to be connected to said member, a cone-shaped cup carried by said member and adapted to fit within the first-named cup, said cup having recesses formed therein, spring-pressed levers mounted in said recesses and adapted to engage in the first-named cup, resilient gaskets mounted between said members, substantially as described.

2. A hose-coupling consisting of two members, one adapted to fit within the other, a cone-shaped enlargement carried by one of said members, a cone-shaped cup carried by said member, cone-shaped cup carried by the other of said members, said member having recesses formed therein, and means to detachably secure the last-named member within the first-named member, substantially as described.

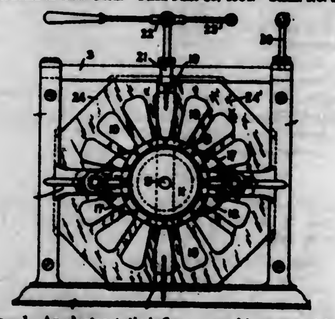
809,760. DISPLAY DEVICE FOR MILLINERY ARTICLES. [illegible], New York, N. Y. Filed July 13, 1905. Serial No. 269,628.

Claim.—1. A display device for an article of millinery, as a hat, comprising a standard, upwardly and outwardly extending arms for supporting the article, provided with arcuate slots, a spring-controlled sleeve slidable on the standard, having branches corresponding to said arms and to which the inner ends of the arms are pivoted, and a plate mounted on the standard having corresponding radial branches provided with pins extending through said slots, said arms being slidable on said pins.



2. A display device for an article of millinery, as a hat, comprising a standard having an annular shoulder a suitable distance from the upper end thereof, and provided at such end with a set-screw, upwardly and outwardly extending arms for supporting the article, provided with arcuate slots, a spring-controlled sleeve slidable on the standard, having branches corresponding to said arms and to which the inner ends of the arms are pivoted, and a plate mounted on said shoulder and held in position by said set-screw, having corresponding radial branches provided with pins extending through said slots, said arms being slidable on said pins.

809,761. ELECTROSTATIC INFLUENCE-MACHINE. RENE THURNEY, Decamps-Nord, Hem., assignor to General Electric Company, a Corporation of New York. Filed June 20, 1904. Serial No. 213,769.



Claim.—1. An electrostatic influence-machine, comprising two sets of vanes revolving in parallel planes but in opposite directions, and stationary collectors projecting into the space between the two sets.

2. An electrostatic influence-machine, comprising two sets of vanes revolving in parallel planes, and a stationary dielectric diaphragm between them.

3. An electrostatic influence-machine, comprising two strong disks of insulating material, metallic vanes radiating from said disks, and means for rotating said disks in opposite directions in parallel planes.

4. An electrostatic influence-machine, comprising a shaft, a strong disk of insulating material secured thereon, a quill sleeved on said shaft and carrying a second disk of insulating material, a set of radiating metallic vanes on each disk, and means for rotating said disks in opposite directions.

5. An electrostatic influence-machine, comprising a shaft, a strong disk of insulation secured thereon, a quill sleeved on said shaft and carrying a second disk of insulation, radiating metallic vanes on each disk, and gearing connecting said shaft and quill to cause them to rotate in opposite directions.

6. In an electrostatic influence-machine, the combination with two strong disks of insulation, of metallic vanes radiating therefrom and having metallic extensions on the peripheries thereof, and brushes touching said peripheries at diametrically opposite points.

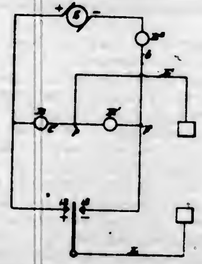
7. In an electrostatic influence-machine, the combination with two sets of insulated metallic vanes revolving in opposite directions, of two collectors located at opposite points between said sets, and two pairs of grounded brushes for touching the outside of said vanes just before they pass the collectors.

8. In an electrostatic influence-machine, a frame composed of a base, columns and horizontal brackets connecting said columns, said frame being cast in integral similar halves.

9. In an electrostatic influence-machine, the combination with a frame comprising a base, columns, connecting-brackets and a cross-bar, of two plates of dielectric secured in said frame with a space between their adjacent edges.

10. In an electrostatic influence-machine, the combination with a stationary dielectric diaphragm, of two sets of insulated vanes rotating in opposite directions on opposite sides of the same, collectors projecting between the sets in an opening in said diaphragm, and two grounded brushes for each set adapted to touch the outside of said vanes just before they reach the collectors.

809,762. TELAUTOGRAPHIC AND OTHER ELECTRIC CIRCUITS. GORDON S. TIFFANY, New York, N. Y., assignor to The Gray National Telautograph Company, New York, N. Y., a Corporation of Virginia. Filed Apr. 23, 1901. Serial No. 56,611.



Claim.—1. The combination of a source of electrical energy, a reversing-switch, the contacts of which are in connection with the positive and negative poles of the source of electrical energy, a shunt forming a connection between the poles of the source of electrical energy, a circuit connecting to the reversing-switch and to said shunt, said shunt having a resistance on each side of its point of connection to said circuit, and an adjusting resistance between one of the poles of the source of electrical energy and the point of connection of the shunt and the reversing-switch to the line leading to said pole, substantially as described.

2. The combination of a source of electrical energy, positive and negative mains leading therefrom, a shunt connecting said mains having three resistances R, R' and R² arranged in series therein, a reversing-switch one contact of which is in connection with the shunt between two of said resistances, R' and R², and the other contact of which is in connection with the main with which the shunt connects beyond the remaining resistance, R, and a circuit connecting to the reversing-switch and to the shunt between the resistance R and the intermediate resistance R', substantially as described.

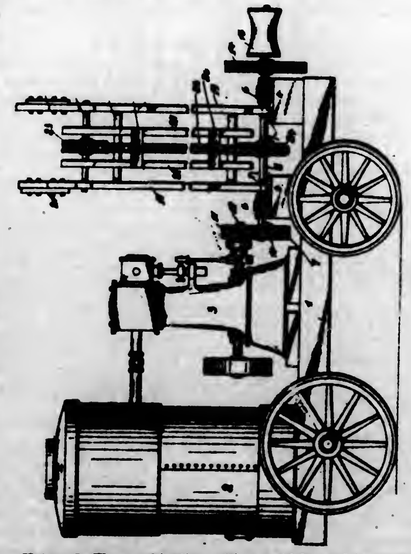
3. In a telautographic transmitter, the combination with a current-reversing switch connected to an operating-circuit and means for throwing said switch in accordance with the movement of the transmitting-pen, of two conducting members adapted to be in connection with positive and negative poles respectively of a source of electrical energy and with which members the contacts of the reversing-switch are in connection, a shunt connecting said members, and a return from said operating-circuit connecting to said shunt, said shunt having a resistance on each side of its point of connection to said return, substantially as described.

4. In a telautographic transmitter, the combination with a current-reversing switch connected to line and means for throwing said switch in accordance with the direction of movement of the transmitting-pen, of two conducting members adapted to be in connection with positive and negative poles respectively of a source of electrical energy and with which members the contacts of the reversing-switch are in connection, a shunt connecting said members and a return from line connecting to said shunt, said shunt having a resistance on each side of its point of connection to said return, substantially as described.

5. In a telautographic transmitter, the combination of means for sending to line to-and-fro impulses of high electromotive force corresponding in number with the movement in extent of the transmitting-pen, and means for sending to line a current of low electromotive force corresponding in polarity with the direction of movement of the transmitting-pen, said last-mentioned means comprising a reversing-switch connected to line, means for throwing said switch in accordance with the direction of movement of the transmitting-pen, two conducting members adapted to be in connection with positive and negative poles of a source of electrical energy and with which members the contacts of the reversing-switch are in connection, a shunt connecting said members, and a return from line connecting to said shunt, said shunt having a resistance on each side of its point of connection to said return, substantially as described.

6. In a telautographic apparatus, the combination of a circuit including a source of electrical energy capable of supplying only a unidirectional current, a line-circuit, and means for shunting into said line-circuit from the first said circuit currents of either positive or negative polarity, substantially as described.

809,763. CONVEYER. ALFRED TOSKINS, Pittsburg, Pa. Filed Jan. 26, 1905. Serial No. 243,040.

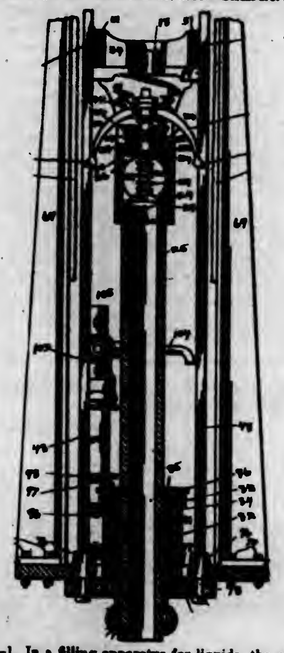


Claim.—1. The combination with a vehicle, and an engine mounted on the vehicle, of a conveyer-frame pivotally mounted on the vehicle and composed of separable sections, transverse frames and longitudinally-disposed guide-rails carried by said frames, a shaft extending longitudinally of the vehicle, a winding-drum on the outer end of said shaft, a sprocket-wheel carried by said shaft between the said guide-rails, a second shaft carried by the conveyer-frame, a sprocket-wheel carried by said second shaft, an endless chain passing over said sprocket-wheels, carriers attached to said chain and traveling on said guide-rails, a second shaft arranged

parallel to said first shaft, means for imparting motion from said engine to said second shaft, and for imparting motion from said second shaft to said first-named shaft, and a winding-drum carried by said second shaft.

2. In an apparatus of the type described, the combination with a vehicle, of a conveyer pivotally mounted upon said vehicle, said conveyer consisting of a plurality of sections, an endless chain mounted upon said conveyer, carriers mounted upon said chain, means carried by said vehicle to operate said chains comprising an engine, a plurality of shafts having intermeshing gear-wheels, and winding-pulleys carried by said shafts, substantially as described.

809,764. FILLING APPARATUS FOR LIQUIDS. ROYAL C. WHITE, Chicago, Ill. Filed Jan. 19, 1905. Serial No. 241,902.



Claim.—1. In a filling apparatus for liquids, the combination of a fluid-pressure cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid connected with the cross-bar, a filling-tube entered at its upper end into the liquid-supply head, a valve within the liquid-supply head controlling the admission of liquid to the filling-tube, a stem for the valve, and means carried by the stem for raising the stem and valve at the limit of the descent of the filling-tube, substantially as described.

2. In a filling apparatus for liquids, the combination of a fluid-pressure cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of th cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid connected with the cross-bar, a filling-tube entered at its upper end into the liquid-supply head, a valve within the liquid-supply head controlling the admission of liquid to the filling-tube, a stem for the valve, a yoke mounted on the stem and engaging a fixed stop at the limit of the descent of the filling-tube for raising the stem and valve, substantially as described.

3. In a filling apparatus for liquids, the combination of a fluid pressure cylinder closed at the top and bottom, a piston on said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid connected with the cross-bar, a filling-tube entered at its upper end into the liquid-supply head, a valve within the liquid-supply head controlling the admission of liquid to the filling-tube, a stem for the valve, a yoke mounted on the stem, a rest for the yoke on the stem, and a lock holding the yoke against upward movement for the yoke to engage a fixed stop and raise the stem and valve at the limit of the descent of the filling-tube, substantially as described.

4. In a filling apparatus for liquids, the combination of a fluid-pressure cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid connected with the cross-bar, a filling-tube having its upper end entered into the liquid-supply head and provided with a seating-face, a valve within the liquid-supply head seating against the face of the filling-tube and controlling the admission of liquid to the filling-tube, a stem for the valve, a spring encircling the stem and holding the valve normally seated, a yoke carried by the stem and adapted to engage a fixed stop and raise the valve and stem against the resistance of the spring as the filling-tube reaches the limit of its descending movement, substantially as described.

5. In a filling apparatus for liquids, the combination of a filling-head having a chamber to receive liquid, a nozzle opening into the chamber of the filling-head for supplying liquid to the chamber, a filling-tube having its upper end entered into the supply-head and in communication with the chamber of the supply-head, a valve seating around the end of the filling-tube in the supply-head and controlling communication between the chamber of the supply-head and the filling-tube, a spring holding the valve normally seated, a stem for the valve, and a yoke carried by the stem and operating to lift the stem and valve at the limit of descent of the filling-tube, substantially as described.

6. In a filling apparatus for liquids, the combination of a cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid and a filling-tube carried by the cross-bar, sliding bars one on each side of the cylinder, a cross-head connecting the sliding bars, a sealing-head carried by the sliding bars and through which the filling-tube passes, and a breakable connection between the cross-bar carrying the supply-head and filling tube and the cross-head of the sliding bars for operating the sealing-head with the initial movement of the filling-tube, substantially as described.

7. In a filling apparatus for liquids, the combination of a cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid and a filling-tube carried by the cross-bar, sliding bars one on each side of the cylinder, a cross-head connecting the sliding bars, a sealing-head carried by the sliding bars and through which the filling-tube passes, a catch on the cross-bar, an arm pivotally mounted on the cross-head and a catch carried by the arm for making and breaking the connection between the cross-bar and the cross-head, substantially as described.

8. In a filling apparatus for liquids, the combination of a cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid and a filling-tube carried by the cross-bar, sliding bars one on each side of the cylinder, a cross-head connecting the sliding bars, a sealing-head carried by the sliding bars and through which the filling-tube passes, a breakable connection between the cross-bar and cross-head for operating the sealing-head with the initial downward movement of the filling-tube, pawls carried by the cross-head, and fixed racks with which the pawls engage for holding the sealing-head against upward movement, substantially as described.

9. In a filling apparatus for liquids, the combination of a cylinder closed at the top and bottom, a piston in said cylinder, a piston-rod downwardly extending from the piston and passing through the closed lower end of the cylinder, a cross-bar attached to the lower end of the piston-rod, a supply-head for liquid and a filling-tube carried by the cross-bar, sliding bars one on each side of the cylinder, a cross-head connecting the sliding bars, a sealing-head carried by the sliding bars and through which the filling-tube passes, a breakable connection between the cross-bar and cross-head for operating the sealing-head with the initial downward movement of the filling-tube, pawls carried by the cross-head, a spring holding the pawls in engagement, and fixed racks with which the pawls engage for holding the sealing-head against upward movement, substantially as described.

10. In a filling apparatus for liquids, the combination of a cross-bar carrying a supply-head and a filling-tube, slidable bars carrying a sealing-head through which the filling-tube passes, a cross-head for the sliding bars and a detachable connection between the cross-bar and cross-head for operating the sealing-head with the initial downward movement of the filling-tube, substantially as described.

11. In a filling apparatus for liquids, the combination of a cross-bar carrying a supply-head and a filling-tube, slidable bars carrying a sealing-head through which the filling-tube passes, a cross-head for the sliding bars, a catch on the cross-bar, an arm pivotally mounted on the cross-head, and a catch on the arm adapted to be engaged with the catch on the cross-bar and interlock the cross-bar and cross-head to operate the sliding head with the initial downward movement of the filling-tube, substantially as described.

12. In a filling apparatus for liquids, the combination of a cross-bar carrying a supply-head and a filling-tube, slidable bars carrying a sealing-head through which the filling-tube passes, a cross-head for the sliding bars, a catch on the cross-bar, an arm pivotally mounted on the cross-head, a catch on the arm adapted to be engaged with the catch on the cross-bar and interlock the cross-bar and cross-head to operate the sliding head with the initial downward movement of the filling-tube, pawls carried by the cross-head, and fixed racks with which the pawls engage to hold the sealing-head against retraction from the upward movement of the filling-tube, substantially as described.

13. In a filling apparatus for liquids, the combination of a cross-bar carrying a supply-head and a filling-tube, slidable bars carrying a sealing-head through which the filling-tube passes, a cross-head for the sliding bars, a catch on the cross-bar, an arm pivotally mounted on the cross-head, a catch on the arm adapted to be engaged with the catch on the cross-bar and interlock the cross-bar and cross-head to operate the sliding head with the initial downward movement of the filling-tube, pawls carried by the cross-head, fixed racks with which the pawls engage to hold the sealing-head against retraction from the upward movement of the filling-tube, a lug on each pawl, and a stop on the cross-bar for each lug, engaging the lug and releasing the pawls from engagement with the racks, substantially as described.

14. In a filling apparatus for liquids, the combination of a frame carrying a filling-tube and a sealing-head, and having at its extreme upper end a rearwardly-extending ear, a fixed plate located rearwardly of the upper end of the frame and having forwardly-extending ears in line with and receiving the ear at the upper end of the frame, and a pivot connecting the ears of the frame and plate and arranged off center in relation to the frame for automatically swinging the lower end of the frame rearwardly and out of line with the filling-hole of the package, and when in line allowing the full weight of the suspended parts to rest on the package in the act of sealing the package, substantially as described.

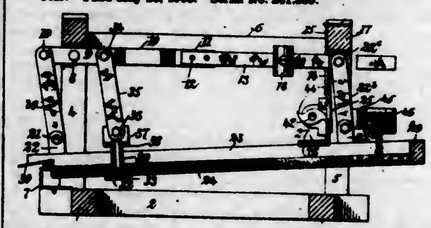
15. In a filling apparatus for liquids, the combination of a frame carrying a sealing-head and a filling-tube, an ear at the extreme upper end of the frame and rearwardly extending, a fixed plate located rearwardly of the upper end of the frame and furnishing a support for the ear of the frame, and a pivot connection between the ear and the fixed plate and located off center in relation to the frame for allowing the lower end of the frame with the sealing-head and filling-tube to swing automatically rearward out of line with the filling-hole of the package, and when in line allowing the full weight of the suspended parts to rest on the package in the act of sealing the package, substantially as described.

16. In a filling apparatus for liquids, the combination of a frame carrying a filling-tube and a sealing-head, a pivoting-ear at the extreme upper end of and on the rear side of the frame, a pivoting-pin for the ear, and a fixed plate located rearward of the upper end of the frame and furnishing a support for the pivoting-ear of the frame and the pivoting-pin, with the pivoting-pin off center in relation to the frame for suspending the frame at its extreme upper end and from its rear side to swing automatically rearward and clear the filling-hole of the package from the filling-tube and sealing-head, and to allow the full weight of the suspended parts to rest on the package in the act of sealing the package, substantially as described.

17. In a filling apparatus for liquids, a slidable filling-tube having a free discharge at its lower end closed by a valve at its upper end, in combination with a venting-valve located on the exterior of and adjacent to the upper end of the filling-tube and automatically closed by the pressure within the filling-tube when entered into and discharging within the package, and automatically opened by pressure of outside air for admitting air as the liquid discharges from the filling-tube during withdrawal from the package, substantially as described.

18. In a filling apparatus for liquids, a reciprocating filling-tube having a free discharge at its lower end, a valve controlling the admission of liquid at the upper end of the filling-tube, and a vent-valve located on the exterior of and adjacent to the upper end of the filling-tube and below the controlling-valve for admitting liquid and automatically closed against the admission of air by pressure within the filling-tube when entered into and discharging within the package, and automatically opened by pressure of outside air to admit air with the ascent of the filling-tube as the liquid discharges during withdrawal from the package, substantially as described.

809,765. ORE-CONCENTRATOR. GEORGE M. WHITNEY, Lawson, Colo. Filed May 20, 1905. Serial No. 261,260.



Claim.—1. An ore-concentrator, comprising a bed for the ore to be separated, tubes therethrough for the discharge of the mineral portions of the material, other tubes having movable relation with said first-named tubes for regulating such discharge, a supporting member for the second-mentioned tubes, and a vertically-swinging member connected with the said supporting member.

2. An ore-concentrator, comprising a reciprocatory bed for the ore to be separated, tubes therethrough for the discharge of the mineral portions of the material, other tubes having movable relation with said first-named tubes for controlling such discharge, a supporting member for the second-mentioned tubes, and a vertically-swinging weighted member connected with the said supporting member.

3. An ore-concentrator, comprising a bed for the ore to be separated, having tubes therethrough for the discharge of the mineral portions of the material, other tubes for regulating such discharge, controlled by the weight of the ore on the bed, a supporting member for the second-mentioned tubes, a vertically-swinging weighted member, and links connecting the said weighted member with the supporting member for the tubes.

4. An ore-concentrator, comprising a bed for the ore to be separated, the said bed having openings therethrough, a series of tubes fitting in the openings for the discharge of the mineral portions of the material, and means for regulating such discharge controlled by the weight of ore on the bed, the said means comprising a second series of tubes for inclosing the upper ends of those of the first series, and a vertically-movable member for supporting and operating the said second series of tubes.

5. An ore-concentrator, comprising a bed for the ore to be separated, tubes extending through the bed for the discharge of the mineral portions of the ore, other tubes having movable relation with said first-named tubes for regulating such discharge, a supporting member for the second-mentioned tubes, a vertically-swinging weighted member connected by links with the supporting member, and links connecting the said weighted member with the bed.

6. An ore-concentrator, comprising a bed for the ore to be separated, having tubes therethrough for the discharge of the mineral portions of the pulverized quartz-rock, other tubes having movable relation with said first-named tubes for regulating such discharge, controlled by the weight of the ore on the bed, and a vertically-movable member for supporting the second-mentioned tubes.

7. An ore-concentrator, comprising a forwardly and downwardly inclined reciprocatory bed for the ore to be separated, having tubes therethrough for the discharge of the mineral portions of the pulverized quartz-rock, other tubes having movable relation with said first-named tubes, for regulating such discharge, the same being controlled by the weight of the ore on the bed, and a vertically-movable member for supporting the second-mentioned tubes.

8. An ore-concentrator, comprising a forwardly and downwardly inclined reciprocatory bed for the ore to be separated, having tubes therethrough for the discharge of the mineral portions of the

pulverized quartz-rock, by gravity, other tubes having movable relation with said first-named tubes for regulating such discharge automatically, the same being controlled by the weight of the ore on the bed, a vertical swinging bifurcated yoke having a rearwardly-extending bar, a suspending-link therethrough for the forward end of the bed, and an adjustable weight on said bar.

9. An ore-concentrator, comprising a forwardly and downwardly inclined reciprocatory bed for the ore to be separated, having tubes therethrough for the discharge of the mineral portions of the pulverized quartz-rock, by gravity, other tubes having movable relation with said first-named tubes for regulating such discharge, automatically, controlled by the weight of the ore on the bed, a vertically-movable member for supporting the second-mentioned tubes, a vertically-swinging yoke carrying an adjustable weight, and suspending-links therefrom for the forward end of the bed.

10. An ore-concentrator, comprising a forwardly and downwardly inclined reciprocatory bed for the ore to be separated, means therein for the discharge of the mineral portions of the pulverized quartz-rock by gravity, means for regulating such discharge automatically, controlled by the weight of the ore on the bed, the first-named means embodying a series of tubes fitted to and extending through the bed, a corresponding series of tubes for inclosing the upper ends thereof, and a vertically-movable member for supporting the second-mentioned tubes, and the last-named means embodying a vertically-swinging yoke carrying an adjustable weight, and suspending-links therefrom for the forward end of the bed, said vertically-movable member being operated from said yoke.

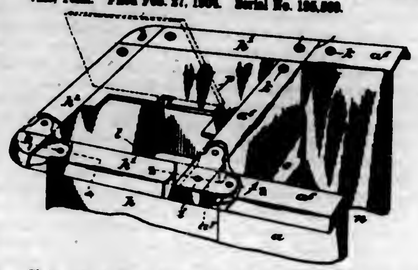
11. An ore-concentrator, comprising a bed for the ore to be separated, means therein for the discharge of the mineral portions of the pulverized quartz-rock, means for regulating such discharge, controlled by the weight of the ore on the bed, said first-named means embodying a series of tubes fitted to and extending through the bed a distance from the forward end thereof, a corresponding series of tubes for inclosing the upper ends of those of the first series, a guided vertically-movable supporting member therefor in and through which the tubes of the second-mentioned series are fitted, a vertically-swinging weighted yoke, and pivoted links therefrom to which the said vertically-movable supporting member is connected at the ends.

12. An ore-concentrator, comprising a supporting-frame, a downwardly and forwardly inclined bed, links pivotally supporting the rearward portion of the bed from the frame, the bed being provided at its forward end with a chute and an abutment, an abutment on the frame against which the first-named abutment strikes on the forward movement of the bed, a weighted member pivoted on the frame above the forward end of the bed, and connected at its forward end by links with the bed, means for moving the bed rearwardly, springs for imparting a return movement to the bed, the said bed being provided with means for the discharge of the heavy mineral portions of the material, and means carried by the pivoted weighted member for regulating such discharge.

13. An ore-concentrator comprising a frame, a bed, links pivotally supporting the rearward portion of the bed from the frame, the bed being provided at its forward end with a chute for the discharge of the lighter portions of the material, and with an abutment, an abutment on the frame and against which the first-named abutment strikes, a pivoted member having a rear extension provided with an adjustable weight, links connecting said pivoted weighted member with the forward portion of the bed, a transverse member carried by the bed near its rearward end and having an upward projection, a rotatable shaft provided with a cam for engaging said projection, spring-plates secured at their upper ends to the frame and at their lower ends to the transverse member, means for supplying the ore to the bed, means for the discharge of the heavy mineral portions of the material, and means connected with said pivoted weighted member for regulating said discharge.

14. An ore-concentrator, a downwardly and forwardly inclined bed, links pivotally supporting the rearward portion thereof from members of the frame, said bed being closed at its rearward end, and provided at its open forward end with an inclined chute having a vertical face constituting an abutment, a transverse abutment against which the first-named abutment strikes in the forward movements of the bed, a pivoted yoke having a rearwardly-extending bar provided with an adjustable weight, a plate having a vertical slot in which the free portion of said bar is guided, links pivoted to the parallel extremities of the yoke, and supporting the forward portion of the bed, a transverse member connecting the sides of the bed near its rearward end, and having a central upstanding projection, spring-plates secured at their upper ends to the frame, and at their lower ends to said transverse member on either side of said plate, a feed-trough for supplying the ore to the bed, and cooperating means from the yoke and on the bed for automatically discharging the mineral portions of the pulverized quartz-rock from the lighter or waste portions thereof by gravity.

809,766. **RANGE CONSTRUCTION.** MATTHEW F. ALLEN, Nashville, Tenn. Filed Feb. 27, 1904. Serial No. 196,809.



Claim.—1. A stove, having a body formed of sheet metal, the lower portion of which is provided with an inwardly-extending horizontal flange, said flange being split at the corners of the body so that the parts thereof will overlap one another, said overlapping parts being secured together.

2. A stove, having a body formed of sheet metal, the lower portion or base of which is corrugated and provided with an inturned flange, for the purpose specified, said flange being divided or split at the corners of the body, and the sections of the flange being rigidly fastened one on the other at said corners.

3. A stove having a sheet-metal body with an integral top rim formed by bending the upper edges of the body outward and thence downward, the top rim being divided at the corners of the stove, and a corner-iron fastened in between the sections of the top rim at said corners.

4. A stove, having a sheet-metal body with an integral top rim formed by bending the upper edges of the body outward and thence downward, the top rim being divided at the corners of the stove, and a corner-iron fastened in between the sections of the top rim at said corners, the said corner-iron comprising a main portion lying level with the top rim, and wings projected oppositely under the sections of the top rim.

5. A stove, having a sheet-metal body with an integral top rim formed by bending the upper edges of the body outward and thence downward, the top rim being divided at the corners of the stove, and a corner-iron fastened in between the sections of the top rim at said corners, the said corner-iron comprising a main portion lying level with the top rim and wings projected oppositely under the sections of the top rim, and the corner-iron further having a downwardly-projected leg arranged to lie against the adjacent corner of the stove body.

6. The combination of a stove-body having a rim, a reservoir having a rim, and a junction-iron fastened to said rims, the junction-iron having projecting members arranged at right angles to each other, and a downwardly-extending angular flange at the junction of said members and engaging a corner of the body.

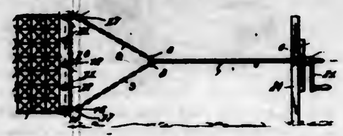
7. The combination of a stove-body provided with a top rim having openings at the corners, angle-irons secured to two corners of the body and having its members extending under the top rims of said body, and a reservoir having a top rim, the front and back rims of the reservoir extending partly over the angle-irons into contact with the front and back rims of the body and secured to said angle-irons.

8. The combination with a stove-body including the fire-box, of a reservoir comprising side, end and bottom walls, the side walls being projected beyond the inner end wall and fastened to the body, and a water-back attached to the inner end wall and projected into the fire-box.

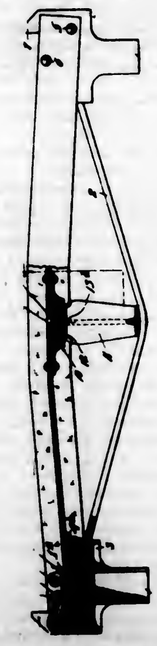
9. The combination of a stove-body having a top rim, a reservoir main part constituting front and back sides and an outer end wall and having a top rim with an opening or break therein, junction-irons fastened to the body and reservoir-rims, and a corner-iron fastened in the break or opening in the reservoir-rim.

809,767. **WIRE-STRETCHER.** SCOTT ARMES, Montgomery, Ind. Filed May 21, 1903. Serial No. 158,022.

Claim.—As an article of manufacture a wire-stretcher comprising a face-plate having an opening therethrough, said opening being enlarged at one end, a washer disposed in said enlargement, threaded rod slidably and removably engaged in the opening and washer, a threaded sleeve removably engaged with the rod and bearing against the washer, a rotating crank formed integral with the sleeve, said rod being bifurcated at one end and having its resultant spaced portions turned outwardly and in the direction of the other end of the rod to form hooks, chains removably engaged with the hooks, hooks carried by the chains, wire-engaging plates adapted for the reception of fencing therebetween, attaching-bolts engaged in the plates, and yokes removably engaged with certain of said bolts, the second-named hooks being engaged with the yokes.



809,768. **TRUCK-BOLSTER.** JOHN C. BARBER, Chicago, Ill. Filed May 4, 1903. Serial No. 156,758.

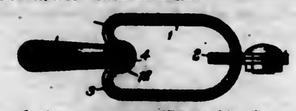


Claim.—1. In a trussed truck-bolster, the combination with a flanged compression member having its web cut at the ends thereof, leaving the ribs 1^b, of caps or joint-blocks resting against the end portions of the web of said compression member, and having grooves in their sides receiving said ribs 1^b, and thereby interlocking the said parts, and a tension-bar having its ends bent and interlocked with the said caps or blocks, substantially as described.

2. In a trussed truck-bolster, the combination with tension and compression members rigidly attached at their ends, of a king-post or strut interposed between the intermediate portions of said compression and tension members, and mounted for oscillatory movement to and from operative position, substantially as described.

3. In a trussed truck-bolster, the combination with tension and compression members, united at their ends, of a two-part king-post or strut interposed between the intermediate portions of said two members, and made up of two parts, one being rigidly secured to said compression member, and the other having a pivotal movement into and out of engagement with said tension member, substantially as described.

809,769. **SWINGLETREE.** JOHN A. BUCHANAN, Pittsburg, Pa. Filed Nov. 10, 1904. Serial No. 232,169.



Claim.—1. A tree or means for attaching horses to wagons, having along one edge inwardly-projecting flanges and with ribs along its opposite edge, said ribs projecting alternately in opposite directions, substantially as set forth.

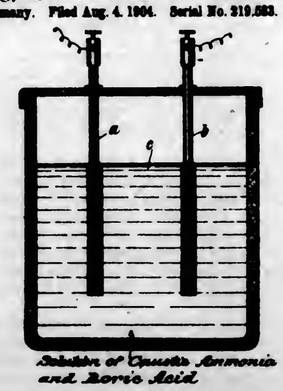
2. A hollow tree or means for attaching horses to wagons having flat or approximately flat sides and provided with ribs along one edge in combination with an attaching U-shaped part or member provided with journals projecting between adjacent ribs on the tree and a strap surrounding the tree and provided with bearings for said journals, substantially as set forth.

3. A hollow tree or means for attaching horses to wagons having flat or approximately flat sides and provided with ribs along one edge in combination with an attaching U-shaped part or member having outwardly-projecting journals projecting between adjacent ribs on the tree and a strap surrounding the tree and provided with bearings for said journals and having an opening or slot for the projection of the body or U-shaped part therethrough, substantially as set forth.

4. A tree or means for attaching horses to wagons having a groove along its front edge, a slotted strap surrounding the tree, a U-shaped part or member projecting through the slot in the strap and having journals arranged in the groove in the tree and bearing on the portions of the strap forming the sides of the slot, substantially as set forth.

5. A hollow tree or means for attaching horses to wagons having flat or approximately flat sides, and provided along one edge with a series of longitudinal ribs projecting alternately in opposite directions, the outer walls of the outer ribs being in the planes of the flat sides of the tree.

809,770. **ASYMMETRIC CELL.** MAX BÜTTNER, Wilmersdorf-Berlin, Germany. Filed Aug. 4, 1904. Serial No. 219,583.



Claim.—In an asymmetric cell, the combination with an aluminium anode and a cathode of any metal, of an electrolyte consisting of a solution of caustic ammonia and boric acid.

809,771. **AUTOMATIC SPEED-REGULATOR FOR INTERNAL-COMBUSTION ENGINES.** JOHN G. CALLAN, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Oct. 28, 1903. Serial No. 178,172.

Claim.—1. A speed-governing device for explosive-engines, comprising means sensitive to fluctuation in speed of the engine for progressively reducing the charge of explosive mixture to a predetermined point and in further continuation of the governing action for maintaining the charge constant at said point while simultaneously delaying the ignition of the charge.

2. A speed-governing device for explosive-engines, comprising means sensitive to acceleration of speed of the engine for progressively reducing the charge of explosive mixture and simultaneously

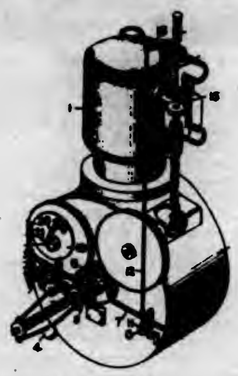
advancing the ignition of the charge to a predetermined point and

spring carried thereby having a free end, which end impresses its li-

19. In a governor, the combination of a ring or support, a de-

for, and means located on each car-platform whereby the switch may

advancing the ignition of the charges to a predetermined point and for then maintaining the charges constant at said point while simultaneously and progressively delaying the ignition of the constant charges.



3. A speed-governing device for explosive-engines, which comprises means sensitive to variations in the speed of the engine, and means controlled thereby which during increase in speed above normal first simultaneously varies the charges of the explosive mixture and the time of ignition thereof to a certain point, and then varies only the time of ignition of the charges.

4. A speed-governing device for explosive-engines, consisting of means sensitive to variations in the speed of the engine, and means actuated thereby adapted to reduce the charges of explosive mixture, and at a predetermined point adapted to maintain the charges constant and to retard the time of ignition of the charges in accordance with increase in speed of the engine.

5. A speed-governing device for explosive-engines, consisting of a means sensitive to changes in speed of the engine, a single actuating member operatively related thereto, a valve mechanism controlled by the actuating member and adapted to progressively reduce the charges of explosive mixture in accordance with increase of speed, an ignition-regulating device controlled also by the actuating member, and means codperating with said actuating member for permitting said mechanism and device to progressively and simultaneously reduce the charges and advance the time of ignition or to progressively and successively reduce the charges and retard the time of ignition.

6. A speed-governing device for explosive-engines, consisting of means sensitive to changes in speed of the engine, a swinging beam actuated thereby, a variable cut-off-valve gear operatively connected with the beam, adjustable means for arresting the swing of the beam in one direction to limit the variation of the cut-off-valve gear, a circuit-breaker also operatively connected with said beam and adjustable spring-actuated pivots adapted separately to cooperate with the swinging beam to differentially actuate the circuit-breaker.

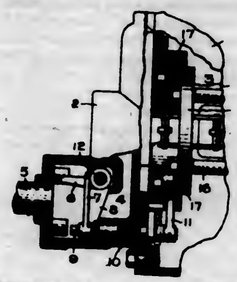
7. In a governing device for explosive-engines, the combination of a valve for varying the supply of combustible to the engine, an adjustable sparking device for igniting the charge, a speed-responsive means, and a lost-motion connection between the valve, sparking device and the speed-responsive means which first actuates the valve through its range of movement to progressively throttle the charge and then the sparking device, to retard the time of ignition.

8. In a governing device for explosive-engines, the combination of a valve for varying the supply of combustible to the engine, an adjustable sparking device for igniting the charge, a speed-responsive means, and an actuator which under the progressive movement of the speed-responsive means simultaneously moves the valve and advances the sparking device to a predetermined point and is then operatively disconnected from the valve and retards the sparking device.

809,772. GOVERNOR-GOVERNOR. JOHN C. GALLAH and FRED-ERIC R. C. DEAN, Lynn, Mass., assignors to General Electric Company, a Corporation of New York. Filed June 19, 1901. Serial No. 213,574.

Claim.—1. A governor comprising a rotating element, and a coiled spring carried thereby having a free end, and a regulator acted upon by the spring.

2. A governor comprising a rotating element, and a coiled spring carried thereby having a free end, which end increases its distance from the axis of rotation under predetermined changes in speed.



3. A governor comprising a rotating element, and a coiled spring mounted thereon having a free end whose axis is parallel with that of the rotating element.

4. A governor comprising a rotating element, and a flat coiled spring mounted thereon having its inner end fastened to the said element with its outer end free to move in a plane at right angles to the plane of the rotating element.

5. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, a regulator acted upon by the spring, and a means for preventing excess movement of the said free end.

6. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, and a damping device which surrounds the orbit of said free end

7. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, a damping device which surrounds the orbit of said free end, and a support for the damper.

8. A governor comprising a revolving element, a clock-spring carried thereby which has flattened turns and a free end, and a regulating device acted upon by the free end of the spring.

9. A governor comprising a revolving element, a coiled spring having flattened turns and free end, and a means for securing the spring to the revolving element in such a position that the free end moves in a plane at right angles to that of the element.

10. A governor comprising a revolving element, a coiled spring mounted thereon and having a free end, and a device which is located within the orbit of said free end and is engaged thereby when the speed of said element exceeds a certain amount.

11. A governor comprising a revolving element, a coiled spring mounted thereon and having a free end, a device which is located within the orbit of said free end and is engaged thereby when the speed of said element exceeds a certain amount, and a damper for preventing excess movement of the end of said spring.

12. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, which tends to wind up or close under conditions of increasing speed, a stationary damper surrounding the orbit of said free end, and a device which extends through the damper into the path of the free end.

13. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, a regulating device acted upon by the spring, and a counterbalance for said spring.

14. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, a second spring of similar characteristic arranged to balance the first, and a regulator acted upon by the springs.

15. A governor comprising a rotating element, a coiled spring mounted thereon having a free end, a valve, and a means acted upon by the free end of the spring for controlling the valve.

16. A governor comprising a rotating element, a coiled spring mounted thereon, and which has a free end that tends to wind up when rotated above a certain speed, and a means for attaching the spring to the element so that its plane of operation is at right angles to that of the element.

17. In a governor, the combination of a support, a flat spring mounted thereon, a stud for supporting the spring under an initial tension, and means for indicating the proper position of the stud with respect to the support.

18. In a governor, the combination of a support, a flat coiled spring, a stud carried by the support and arranged to impart initial movement to the spring and also to form its sole support, and an indicator for showing the correct angular position of the stud on the support.

19. In a governor, the combination of a ring or support, a device mounted thereon which is normally restrained and operates under emergency conditions, an adjustable means for clamping the device to the ring or support, and an indicator which is a measure of the restraining force opposing the action of said device.

20. A governor comprising a revolving element, a spring carried thereby which is bent in the form of a curve and is provided with a free end, and a regulating device which is acted upon by the free end of the spring under definite speed conditions.

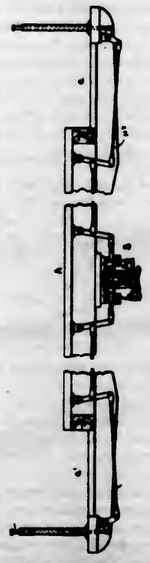
21. A governor comprising a revolving element, a spring which is bent in the form of a curve and is secured to the revolving element and has an end that is free to move toward and away from the axis of rotation as the speed changes, and a regulating device which is caused to assume a given position by reason of the action of the free end of the spring upon a definite increase in speed.

22. A governor comprising a revolving element, a spring carried thereby which is bent in the form of a curve and has a free end that moves toward and away from the axis of rotation as the speed of said element changes, a damper for preventing overtravel of the free end of the spring, and a regulating device which is acted upon by the free end of the spring before it engages the damper.

23. A governor comprising a revolving element, a spring carried thereby which is secured to the element and has a free end that moves toward and away from the axis of rotation as the speed of the element changes, a damper surrounding the orbit of the free end of the spring which has an opening therein through which the free end of the spring acts, and a regulator which is under the control of the free end of the spring.

24. A governor comprising a revolving element, a coiled spring carried thereby which is fixed at one point and has a free actuating end, the turns of the spring being initially flattened so that the turns will center themselves about the point of support under normal speed conditions, a damper surrounding the orbit of the free end of the spring, and a regulator that is acted upon by the spring before its free end is restrained by the damper.

809,773. EMERGENCY OPERATING MEANS FOR REVERSING SWITCHES. FRANK B. CASE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 23, 1904. Serial No. 221,832.



Claim.—1. A motor reversing-switch, service-operating devices therefor and means located on each car-platform whereby the switch may be operated to move it in one direction only.

2. A motor reversing-switch, service-operating devices therefor and means located at one end of the car for moving the switch in one direction, and means at the other end of the car for moving the switch in the opposite direction.

3. A motor reversing-switch, service-operating devices therefor, and means located at one end of the car whereby the switch may be reversed when it is set to cause the car to be propelled forwardly with respect to that end of the car.

4. A motor reversing-switch, service-operating devices therefor, and means located at one end of the car whereby the switch may be operated to move the switch to its reverse position relatively to that end of the car, but not to its forward position.

5. A motor reversing-switch, service-operating devices therefor, and means operable from each end of the car for throwing the switch to its reverse position relatively to that end of the car.

6. A motor reversing-switch, service-operating devices therefor, and means operable from each end of the car for throwing the switch to its reverse position relatively to that end of the car, but not to its forward position.

7. A motor reversing-switch, service-operating devices therefor, manually-operated mechanism for moving said switch, and means for returning said manually-operated mechanism to its normal position after it has performed its function.

8. A motor reversing-switch, service-operating devices therefor, a lever, means for bringing the lever into contact with the movable member of the switch for operating it, and means for returning the lever to its normal position after it has performed its function.

9. A motor reversing-switch, a pair of levers arranged adjacent the movable member thereof but disconnected therefrom, and an operative connection extending from each lever to one end of the car for actuating the lever.

10. A motor reversing-switch, a pair of levers mounted adjacent the movable member thereof but disconnected therefrom, a connection extending from one lever to one end of the car, and a second connection extending from the other lever to the other end of the car.

11. A motor reversing-switch, a pair of bell-crank levers pivotally mounted adjacent the movable member of the switch and each having an arm operatively associated with said movable member, and a connection extending from each lever to one end of the car.

809,774. SYSTEM OF CONTROL. FRANK B. CASE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 13, 1905. Serial No. 264,763.

Claim.—1. In a system of control, in combination, a motor-circuit, a pneumatic controlling system, a circuit-breaker in said motor-circuit, and means operable upon the exhaustion of said pneumatic controlling system while the motor-circuit remains energized to trip said circuit-breaker.

2. In a system of control, in combination, a motor-circuit, a pneumatic controlling system, a circuit-breaker in said motor-circuit, and means operable upon the exhaustion of said pneumatic system for tripping the circuit-breaker when the motor-circuit remains energized but not when the motor-circuit is deenergized.

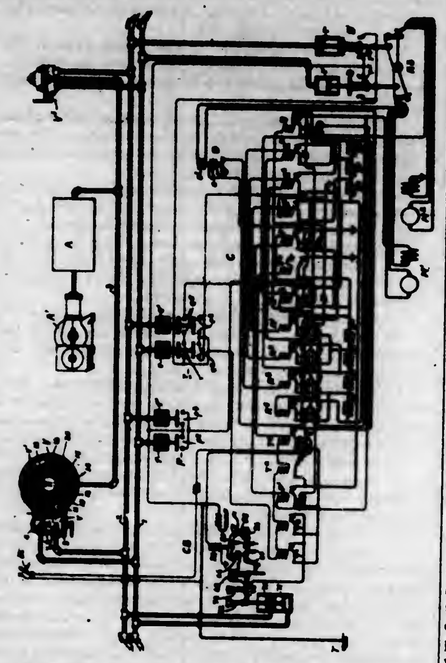
3. In a system of motor control, in combination, a motor-circuit, a pneumatic controlling system, a circuit-breaker, means for setting said circuit-breaker, means for tripping said circuit-breaker on overload in the motor-circuit, and means for tripping the circuit-breaker upon the exhaustion of the pneumatic controlling system while the motor-circuit remains energized.

4. In a system of control, in combination, a motor-circuit, a pneumatic controlling system, a circuit-breaker, a piston in said pneumatic system, an electromagnet in said motor-circuit, and means codperating with said piston and said electromagnet for tripping the circuit-breaker upon the exhaustion of the air from said piston while said electromagnet remains energized.

5. In a system of control, a motor-circuit, a pneumatic controlling system, a circuit-breaker, a piston in said pneumatic system, an electromagnet in said motor-circuit, and means codperating with said piston and said electromagnet for tripping said circuit-breaker upon the exhaustion of air from said piston while the said electromagnet remains energized, the arrangement being such that the circuit-breaker is not tripped when the exhaustion of the piston and the deenergization of the electromagnet take place simultaneously.

6. In a system of control, a motor, a controller arranged to connect said motor to a source of current-supply, electromagnetic actuating means therefor, a reversing-switch, actuating means for said

reversing-switch, and means associated with the actuating means for the reversing-switch for completing a circuit through the controller-actuating means after the reversing-switch has been fully operated.



7. In a system of control, a motor, a controller arranged to connect said motor to a source of current-supply, actuating means for said controller, a reversing-switch, a piston for actuating said reversing-switch, a yielding connection between said piston and said reversing-switch, and means associated with said piston for controlling the energizing-circuit of the controller-actuating means.

8. In a system of control, a motor, a controller arranged to connect said motor to a source of current-supply, actuating means for said controller, a reversing-switch, a piston for actuating said switch, a yielding connection between said piston and said switch, and contacts associated with said piston for controlling the energizing-circuit of said controller-actuating means, the said yielding connection being arranged to maintain said contacts open except when the pressure upon the piston is greater than that required to operate the reversing-switch.

9. In a system of control, a motor, a controller for connecting said motor to a source of current-supply, electromagnetic actuating means for said controller, a controlling-circuit for said actuating means, a reversing-switch, a pneumatically-actuated piston, a spring between said piston and said switch, and contacts associated with said piston and arranged in said controlling-circuit.

10. In a system of control, a motor, a controller for connecting said motor to a source of current-supply, electromagnetic actuating means for said controller, a controlling-circuit for said actuating means, a reversing-switch, a pneumatically-actuated piston, a spring between said piston and said switch, and contacts associated with said piston and located in said controlling-circuit, the tension of the spring being such that said contacts are closed only upon a greater pressure than that required to operate said reversing-switch.

11. In a system of control, a plurality of motors, a motor-controller arranged to connect said motors to a source of current-supply in series with each other and to connect them in a closed circuit when the controller is in its "off" position, means controlled by current from said source of supply for operating said controller, a reversing-switch for said motors, and means independent of the current from said source of supply for operating said reversing-switch.

12. In a system of control, a plurality of motors, a controller having normally closed contacts for connecting said motors in a closed circuit and normally open contacts arranged to connect the motors to a source of current-supply, electromagnetic actuating means for said contacts, means for connecting said actuating means to said source of supply, a reversing-switch, and independent means for operating said switch.

13. In a system of control, a plurality of motors, a motor-controller comprising a plurality of contacts for connecting said motors to a source of current-supply, and normally closed contacts for connecting said motors in a closed circuit, electromagnetic controlling means for said contacts, an actuating-circuit for said controlling means arranged to cause said normally closed switches to open when others of said switches are closed, a reversing-switch, and means for operating said reversing-switch without operating the controller-contacts.

14. In a system of control, a plurality of motors, a motor-controller including normally closed contacts arranged to connect said motor in a closed circuit, a source of current-supply, means controlled by current from said source of supply for operating the controller and opening said contacts, a reversing-switch, and means independent of said current for operating said switch.

15. In a system of control, a plurality of motors, a motor-controller arranged to connect said motors to a source of current-supply and including normally closed contacts arranged to connect said motors in a closed circuit, means controlled by current from said source of supply for operating said controller and opening said contacts, a reversing-switch, and means independent of the current furnished by said source of supply for operating said reversing-switch.

16. In a system of control, a plurality of motors, a motor-controller adapted to return to its "off" position when otherwise free and arranged to connect said motors in a closed circuit when in its "off" position and to connect them to a source of current-supply in series with each other when in a running position, means controlled by current from said source of supply for maintaining said controller in a running position, a reversing-switch, and means for operating said reversing-switch independently of said current.

17. In a system of control, a plurality of motors, a motor-controller of the separately-actuated contact type arranged to connect said motors in closed circuit when the controller is in its "off" position, a reversing-switch, electromagnetic actuating means for said controller-contacts, controlling-relays for said actuating means, and pneumatically-actuated means for operating said relays and said reversing-switch.

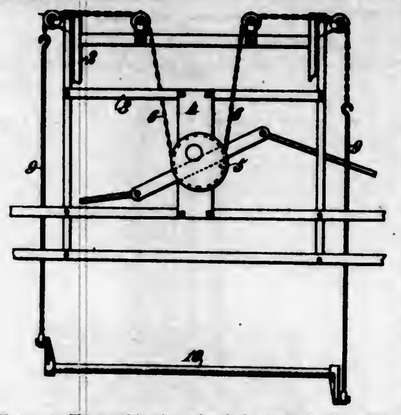
18. In a system of control, a plurality of motors, a controller having normally closed contacts for connecting said motors in a closed circuit and normally open contacts for connecting said motors to a source of current-supply, electromagnetic actuating means for said contacts, a governing system independent of the current from said source of supply for connecting said contact-actuating means to said source of supply, a reversing-switch, and means connected with said governing system for operating said reversing-switch.

809,775. CALF-WEANER. WILLIAM B. CHANDLER, Bicampo, Tex. Filed Feb. 13, 1905. Serial No. 246,316.

Claim.—1. A calf-weaner comprising a plate having a recess in its upper edge, sleeves carried by the plate at opposite sides of the recess, said sleeves having inwardly-extending flanges at their ends, rods slidably engaged in the sleeves and lying normally with their inner ends in close relation, said rods extending outwardly of the sleeves, collars carried by the rods within the sleeves, and springs engaged with the rods between their collars and the outermost flanges of the sleeves, said springs being arranged to hold the rods yieldably in their normal positions.

2. As an article of manufacture a calf-weaner comprising a plate having a recess in one of its edges extending thereinto, the portions of the plate at the sides of the recess being curved laterally and inwardly to form aligning sleeves, the metal at the ends of the sleeves being crimped inwardly to form flanges, rods slidably disposed in the sleeves and lying normally with their inner ends in close relation, said rods extending outwardly beyond the sleeves, collars carried by the rods within the sleeves, and helical springs engaged with the rods between the collars and the outermost flanges of the sleeves to hold the rods yieldably in their normal positions.

809,776. SHUTTLE-MOTION FOR LOOMS. MADISON L. CHRISTIAN and HARRY B. REYNOLDS, Clinton, Iowa, assignors to American Wire Cloth Company, Clinton, Iowa, a Corporation of Iowa. Filed May 17, 1905. Serial No. 260,767.



Claim.—1. The combination of a lathe-frame having chain-wheels, guides on the loom-framework, and chains connected with the wheels for turning the same, and passing over the guides, the points on the guides engaged by the chains being in alinement with each other and with the axis of motion of the lathe-frame.

2. The combination of a lathe-frame having chain-wheels, sheaves on the loom-framework, and chains connected with said chain-wheels and passing over the sheaves, the points of contact of the sheaves engaged by the chains being in line with each other and with the axis of motion of the lathe-frame.

3. The combination of a lathe-frame having circular chain-wheels eccentrically mounted, sheaves on the loom-framework, and chains connected with the said chain-wheels and passing over the sheaves, the points on the sheaves which are engaged by the chain-wheels being in line with each other and with the axis of motion of the lathe-frame.

4. The combination of a lathe-frame having chain-wheels, sheaves on the loom-framework, chains connected with said chain-wheels and passing over the sheaves, the points of contact of the sheaves engaged by the chains being in line with each other and with the axis of motion of the lathe-frame, and sheaves mounted on said loom-framework in horizontal alinement with said first-mentioned sheaves and over which the chains pass.

5. The combination of a lathe-frame having circular chain-wheels eccentrically mounted, sheaves on the loom-framework, chains connected with the chain-wheels and passing over the sheaves, the points on the sheaves which are engaged by the chains being in line with each other and with axis of motion of the lathe-frame, and sheaves on the loom-framework over which the chains pass and in horizontal alinement with the first-mentioned sheaves.

809,777. RAZOR-STROP. GEORGE W. COLLINS, St. Joseph, Mo. Filed July 12, 1905. Serial No. 269,277.

Claim.—1. In a razor-strop the combination of a pair of strop members secured together end to end by a flexible connection, a ring passing through the space between said strop members and engaging the flexible connection, a handle pivotally connected with said ring, a center plate composed of rigid material and having convex surfaces on its opposite sides, said plate being provided with a longitudinal slot opening from one end and with a flat surface at the other end, said flat surface engaging said ring whereby the plate is prevented from springing from the strop at this end, a plate located over the end of the two strop members and the slot end of the center plate, said plate having a hook, and a screw passing through the slot, said last-named plate holding the ends of the strop members to the center plate and adjustably securing the center plate against lateral motion with respect to the body of the strop.

2. A razor-strop having a pair of strop members, adjustable means located between them for supporting them, said means comprising a plate having an open-ended slot in its end, and means for adjustably securing the plate to the strop members at any desired point along said slot.

3. A razor-strop having a pair of flexible strop members loosely connected together, a supporting-plate located between said members and having a longitudinal slot in one end, an adjusting-screw adapted to pass through said slot and said members for adjustably securing the plate to the strop members and a handle loosely connected with said strop members.

4. A razor-strop having a pair of strop members, means located between them for supporting them, said means comprising a plate having convex faces against which the strop members loosely engage, a handle swingingly connected with the strop at the end of the center piece and a suspending loop at the opposite end of the strop.

5. A razor-strop comprising a pair of flexible strop members secured together end to end, a handle loosely connected with said members at a point adjacent to that at which they are secured together, said members being free to move with respect to each other at all points along their surfaces, and a convex plate located between said members.

809,778. LADDER ATTACHMENT FOR PIPES. JOHN F. COLLINS, Buffalo, N. Y. Filed Sept. 12, 1905. Serial No. 278,177.

Claim.—1. The combination with a pipe, of two clamping-collars having perforated lugs, a bar having an eye at each end adapted to be held between said lugs and having also laterally-extending rungs and bolts, passing through said lugs and the eyes of said bar to clamp the collar to the pipe and to clamp the bar between said lugs.

2. The combination with a pipe, of two clamping-collars formed each in two parts having outstanding lugs, two bars arranged on opposite sides of the pipe and having eyes at their ends, said bars having also oppositely-extending rungs, and bolts passing through said lugs and the eyes of said bars to clamp said collars to the pipe and to clamp the bars between the lugs on said collars.

3. The combination with a pipe, of two clamping-collars on said pipe, and two bars arranged on opposite sides of said pipe and having their ends secured to said collars, said bars having laterally-extending rungs and the rungs on one bar being on planes between the rungs of the other bar.

809,779. WINDOW-BLIND SLAT-FASTENER. MICHAEL J. COGAN, Port Chester, N. Y. Filed Mar. 11, 1905. Serial No. 249,867.

Claim.—1. In a window-blind, a bar having pivotal connection with the upper and lower sets of slats, a crank-shaft mounted to swing on the lower end of the blind and having a horizontal portion engaging in said bar, a handle on said crank-shaft, and a spring-yielding plate having channels on its outer face for receiving said handle.

2. In a window-blind, a bar consisting of sections, the upper section being pivotally connected to the upper slats of the blind, while the lower section is pivoted to the lower slats of the blind, a metal plate connecting the sections and having a cut-away portion for receiving the parting-strip of the blind, a plate secured to the

lower end of the blind, a crank-shaft mounted to swing in said plate and having pivotal connection with the lower section of said bar, a

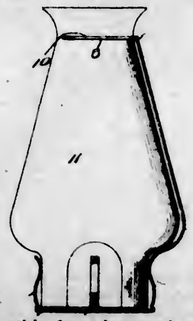
3. In a door-hanger the combination, with two bars, of a part

a plurality thereof on one side in position relatively to a plurality on

means whereby the cigar end may release the restraining means,

lower end of the blind, a crank-shaft mounted to swing in said plate and having pivotal connection with the lower section of said bar, a handle on said shaft, and a spring-yielding plate having channels for receiving said handle.

809,780. CHIMNEY-HOLDER. ANGUS R. COOPER, Mobile, Ala. Filed June 22, 1905. Serial No. 266,418.



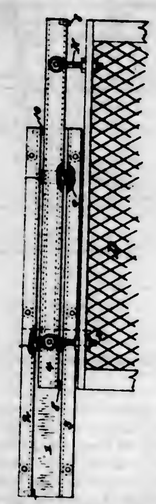
Claim.—As an article of manufacture, a lamp-chimney support comprising a lamp-burner gallery having chimney-engaging fingers, one of said fingers having a vertically-extended portion formed integrally therewith, and a chimney-engaging member carried by the upper end of said extended portion, said member including bowed arms having spaced outwardly-turned ends.

809,781. DOOR-HANGER. MYRON COMEY, Brooklyn, N. Y., assignor to Reliance Ball Bearing Door Hanger Company, New York, N. Y., a Corporation of New York. Filed Aug. 26, 1903. Serial No. 170,777.

Claim.—1. In a door-hanger the combination with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices on each side of the intermediate bar and between it and the outside bars, and means for retaining a plurality of antifriction devices on one side of the intermediate bar in position relatively to a plurality of antifriction devices on the other side thereof.

2. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices on each side of the intermediate bar and between it and the outside bars, and means for retaining a plurality of antifriction devices on one side of the intermediate bar in position relatively to a plurality of antifriction devices on the other side thereof, said antifriction devices being divided equally to provide an equal number thereof on both sides of the intermediate bar.

3. In a door-hanger the combination, with two bars, of a part movable between and along the bars, a plurality of antifriction devices between each bar and the said part, and means for spacing and for maintaining the spacing of antifriction devices on each side of said part.



4. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a spacing-strip provided on each side with a plurality of projections each having an aperture therein, and movable antifriction devices arranged in said apertures.

5. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices arranged on each side of the intermediate bar and between it and the adjacent outside bar, a retainer for each antifriction device and a strip securing together each and all of said retaining devices on both sides of the intermediate bar.

6. In a door-hanger the combination, with a movable body, of a plurality of movable antifriction devices arranged on each side thereof, and means for retaining a plurality of antifriction devices on one side of said movable body in fixed relative position with regard to a plurality of antifriction devices on the other side thereof.

7. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices arranged on each side of said intermediate bar and between it and the adjacent outside bar, and a movable spacing device comprising a strip provided with a plurality of projections from each side thereof—each of said projections having its outer end bent at substantially right angles to the strip and provided with an aperture and arranged between the intermediate bar and the adjacent outside bar and containing in said aperture one of the aforesaid antifriction devices.

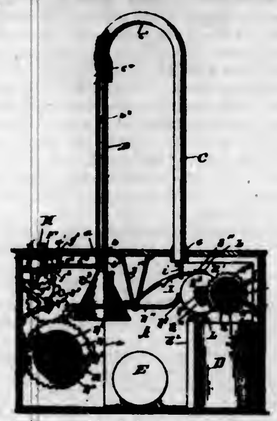
8. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices on each side of the intermediate bar and between it and the outside bars, and means for retaining all of said antifriction devices in fixed relative position.

9. In a door-hanger the combination, with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices on each side of the intermediate bar and between it and the outside bars, and a member having its major portion adjacent to said intermediate bar and portions thereof bent to project between the intermediate bar and each of said outside bars, said bent portions being provided with apertures in which said antifriction devices are contained.

10. In a door-hanger the combination with two outside bars and an intermediate bar, one of said elements being movable with respect to the other, of a plurality of movable antifriction devices arranged on each side of said intermediate bar, a spacer for retaining

a plurality thereof on one side in position relatively to a plurality on the other side; and pins arranged near the ends of said bars to engage said spacer and readjust it relatively to the bars when it becomes displaced.

809,783. COMBINED CIGAR CUTTER AND LIGHTER. WILLIAM H. CRAWFORD, Chickasaw, Va. Filed May 11, 1905. Serial No. 259,953.



Claim.—1. In a combined cigar cutter and lighter, the combination of a box provided with a slot, a burner-support pivotally mounted in the slot and provided with a reservoir at its lower end within the box, a burner on the support, a contact-point adjacent to the support, a contact-point supported above and in front of the first-named contact-point, an extinguisher supported above the burner, an electric battery, a spark-coil, an electrical connection between the contact-points and including the battery and spark-coil, a cutter-plate for cutting cigar ends, slidably mounted on the lower face of the box-top beneath an opening therein adapted to receive the end of the cigar, a connection between the cutter-plate and the burner-support whereby the reciprocation of the latter will vibrate the former, a spring-actuated lug, means for restraining the movement of the lug, means whereby said restraining means may be released by the end of the cigar, means on the cutter-plate engaged by the lug, to move the plate rearwardly, and tilt the burner-support forwardly, means engaging the lower end of the burner-support to hold the parts in such position, a spring-actuated lug for releasing said holding means, means for restraining the movement of the lug, and means whereby the first-named lug may release said restraining means.

2. In a combined cigar cutter and lighter, the combination of a burner, a swinging support for the burner, means for feeding the burner with fluid, means for igniting the burner comprising a contact-point on the burner, a contact-point adjacent thereto, and in the path of travel of the contact-point on the burner, an open electrical circuit including a battery and a spark-coil, and closed by the conjunction of the contact-points, a cigar-end-cutter plate slidably mounted beneath an opening in the box-top for receiving the end of the cigar to be cut, a connection between the cutter-plate and the swinging support, whereby the rearward movement of the cutter-plate swings the support forward, means for moving the cutter-plate rearwardly, means for restraining said moving means, means whereby the cigar end in the opening in the box-top, may release said restraining means, means for holding the cutter-plate in its rearward position, moving means for releasing the holding means, means for restraining the movement of the releasing means, means whereby the cutter-plate-moving means may release the restraining means, whereby the parts return to their normal position, and means for extinguishing the burner.

3. In a combined cigar cutter and lighter, the combination of the box, a swinging support pivotally mounted in the box-top, a burner on the support, means for igniting and extinguishing the burner operated by the movement of the support, a cutter-plate for clipping the ends of cigars movably mounted beneath an opening in the box-top, means whereby the rearward movement of the cutter-plate may swing the support forwardly, means to move the cutter-plate rearwardly, means to restrain the cutter-plate-moving means, means whereby the cigar end may release the restraining means, means for holding the cutter-plate in its rearward position, moving means for releasing the holding means, means for restraining the movement of the releasing means, and means whereby the cutter-plate-moving means may release the restraining means.

4. In a combined cigar cutter and lighter, the combination of a casing, a swinging support mounted in the top of the casing, and provided with a burner, means for igniting and extinguishing the burner operated by the movement of the support, a cutter-plate for coöperating with an opening in the casing, to clip the ends of cigars inserted through the opening, a connection between the cutter-plate and the swinging support, whereby movement of the former imparts motion to the latter, means to move the plate rearwardly, means to restrain the moving means, means whereby the cigar end may release the restraining means, means to hold the cutter-plate in its rearward position, moving means to release the holding means, means to restrain the releasing means, and means whereby the cutter-plate-actuating means may release the restraining means.

5. In a combined cigar cutter and lighter, the combination of a casing, a swinging support mounted in the top of the casing and provided with a burner, means for igniting and extinguishing the burner, operated by the movement of the swinging support, a cutter-plate coöperating with an opening in the casing to clip the ends of cigars inserted through the opening, means for actuating the swinging support from the movement of the cutter-plate, normally inactive means for moving the cutter-plate rearwardly, means whereby the cigar end may actuate the cutter-plate-moving means, means for holding the cutter-plate in its rearward position, means for releasing said holding means, and means whereby the cutter-plate-moving means may actuate the releasing means.

6. In a combined cigar cutter and lighter the combination of a casing, a swinging support mounted in the top of the casing and provided with a burner, means for igniting and extinguishing the burner operated by the swinging of the support, a cutter-plate coöperating with an opening in the casing to clip the end of a cigar inserted through the opening, means for actuating the swinging support synchronously with the cutter-plate, normally inactive means for moving the cutter-plate in one direction, means whereby the cigar end may actuate the cutter-plate-moving means, means for holding the cutter-plate at the end of its movement, normally inactive means for releasing the holding means, and means whereby the cutter-plate-moving means may actuate the releasing means.

7. In a combined cigar cutter, and lighter, the combination of a swinging support provided with a burner, means for igniting and extinguishing the burner operated by the swinging of the support, a cigar-cutter for clipping the end of a cigar inserted in the cutter, means for actuating the cutter and for swinging the support forwardly, means for holding the support in its forward position, moving means for actuating the cutter and swinging the support and subsequently releasing the holding means, and means whereby said moving means, may be actuated by the insertion of the cigar end into the cutter.

8. In a combined cigar cutter and lighter, the combination of a swinging support, provided with a burner, a cigar-cutter for clipping the end of a cigar inserted in the cutter, a single means for actuating the cutter and for swinging the support in one direction, means for holding the support from swinging in the opposite direction, means for releasing the holding means, and means whereby the insertion of the cigar end into the cutter may actuate the cutter-actuating means, and the releasing means.

9. In a combined cigar cutter and lighter, the combination of a swinging support provided with a burner, means whereby the burner is ignited and extinguished by the swinging of the support, a cigar-cutter for clipping the ends of cigars inserted in the cutter, means for synchronously actuating the cutter and swinging the support, and means whereby said means may be actuated by the insertion of the cigar end into the cutter.

10. In a combined cigar cutter and lighter, the combination of a support provided with a burner, a cigar-cutter for clipping the ends of cigars inserted into the cutter, means acting in sequence for actuating the cutter and igniting and extinguishing the burner, and means whereby the insertion of the cigar end into the cutter may actuate the said means.

11. In a combined cigar cutter and lighter the combination of a burner, means whereby to clip the end of a cigar, means whereby to ignite the burner, means to extinguish the burner, means actuating each of the said means in the order named, and means whereby the end of the cigar may actuate the said actuating means.

12. In a combined cigar cutter and lighter, the combination of

a burner, a cigar-cutter for clipping the end of a cigar inserted into the cutter, means for igniting and extinguishing the burner, means whereby the insertion of the cigar end into the cutter may actuate the igniting and extinguishing means.

13. In a combined cigar cutter and lighter the combination of a swinging support, provided with a burner, means whereby the swinging of the support in one direction ignites the burner, means whereby the swinging of the support in the opposite direction extinguishes the burner, a cigar-cutter for clipping the end of a cigar inserted in the cutter, means for actuating the cutter and swinging the support, and means whereby the insertion of the cigar end into the cutter may actuate the last-named means.

809,783. SASH-BALANCE. HERBERT A. CROCKETT, Patten, Me. Filed Mar. 31, 1905. Serial No. 253,699.

Claim.—1. In a sash-balance, in combination, a guide-bar, a lazy-tongs guided thereupon, a resilient bow having extensions attached to said lazy-tongs, and means for attaching a sash-cord to said sash-balance.

2. In a device of the class described, in combination, a guide-bar, a sleeve slidably mounted thereon, a lazy-tongs having its extremity attached to said sleeve, a resilient bow attached to the arms of said lazy-tongs and tending to extend said lazy-tongs, and means for attaching a cord to said device.

3. In a device of the class described, in combination, a lazy-tongs, a resilient bow at one extremity thereof and having extensions attached to the arms of said tongs and constraining same, said bow lying substantially in the plane of said tongs, means for fixing one end of said device to a support, and means for attaching the other end of said device to a sash.

809,784. AUTOMATIC FRICTION-GOVERNOR IN FLY-WHEELS. THADDEUS L. CUMMINGS, Spencer, Iowa. Filed May 28, 1904. Serial No. 210,266.

Claim.—1. In an apparatus of the class described, the combination of a driving member, a fly-wheel secured thereto, oppositely-disposed forwardly-projecting pins on the fly-wheel, oppositely-disposed curved levers each provided with a series of perforations for engaging the pins, cotter-pins for securing the levers on the pins, springs normally retaining the levers in their inward positions, balls on the corresponding ends of the levers, oppositely-disposed rearwardly-projecting brackets on the fly-wheel, brake-shoes on the face of the fly-wheel adjacent to the brackets, rock-levers pivoted to the brackets and provided with forwardly-extending arms for engaging the levers, a spring connecting the forwardly-extending arms, inwardly-extending arms on the rock-shaft, and provided with brake-shoes, a disk loosely mounted on the driving member for engaging the brake-shoes on the fly-wheel and for engagement by the brake-shoes on the inwardly-extending arms of the rock-shaft.

2. In an apparatus of the class described, the combination of a driving member, a fly-wheel secured thereto, oppositely-disposed forwardly-projecting pins on the fly-wheel, oppositely-disposed curved levers each provided with a series of perforations for engaging the pins, means for securing the levers on the pins, a spring for retaining the levers in their inward positions, balls on the corresponding ends of the levers, oppositely-disposed rearwardly-projecting brackets on the fly-wheel, brake-shoes adjacent to the brackets and secured to the fly-wheel, rock-levers pivoted to the brackets and provided with forwardly-extending arms for engaging the levers, a spring connecting the forwardly-extending arms, inwardly-extending arms on the rock-shaft, a disk loosely mounted on the driving member, and means on the inwardly-extending arms of the rock-shaft for engaging the disk and forcing the same against the brake-shoes on the fly-wheel.

3. In an apparatus of the class described, the combination with a driving member, of a fly-wheel secured thereto, oppositely-disposed curved levers pivoted on the front face of the fly-wheel and provided with balls at their free ends, rearwardly-projecting brackets on the fly-wheel, rock-shafts pivoted in the brackets and each provided with a forwardly-extending arm for engaging the curved levers, brake-shoes secured to the fly-wheel adjacent to the brackets, a disk loosely mounted on the driving member, and means on the rock-shaft for engaging the disk and forcing the same into contact with the brake-shoes on the fly-wheel.

4. In a friction-governor, the combination of the driving member, a fly-wheel secured thereto, oppositely-disposed curved levers pivoted on the forward face of the fly-wheel and provided with balls at their free ends, rock-shafts pivoted on the rear face of the fly-wheel, means on the rock-shafts for engaging the curved levers, a disk loosely mounted on the driving member, and means on the rock-shafts for engaging the rear face of the disk to force the same into contact with the fly-wheel.

5. In a friction-governor, the combination of the driving member, a fly-wheel secured thereto, weighted levers pivoted on the front face of the fly-wheel, rock-shafts pivoted on the rear face of the fly-wheel, a disk loosely mounted on the driving member, an arm on each rock-shaft for engagement by the weighted levers, and means on the rock-shafts for engaging the disk to force the same into contact with the fly-wheel.

6. In a friction-governor, the combination of a driving member, a fly-wheel secured thereto, a disk loosely mounted on the driving member, means on one face of the fly-wheel for forcing the disk into contact therewith, and means on the other face of the fly-wheel to actuate said engaging means, on the attainment of a predetermined speed by the driving member.

7. In a friction-governor the combination of a driving member, a fly-wheel secured thereto, a driven member adjacent to the fly-wheel, means on one face of the fly-wheel for engaging the driven member, and means on the other face for actuating said engaging means on the attainment of a predetermined speed by the driving member.

809,785. BASEL. GUSTAF L. R. DAHLBERG, Allwood, N. J. Filed May 4, 1905. Serial No. 258,756.

Claim.—1. The combination in an easel formed of a single piece, of the face-plate, and the backstay composed of the two wings, said wings being partly separated from the face-plate by score-lines to enable the backstay to be set in a position for supporting the face-plate in use and being provided with openings having curved sides, the face-plate having also a flap partly separated from it by a score-line, said flap being provided with ears arranged to engage with the two openings in the wings when the latter are bent back and the flap bent down, substantially as described.

2. The combination in an easel formed of a single piece, of the face-plate, and the backstay composed of the two wings, said wings being partly separated from the face-plate by score-lines to enable the backstay to be set in a position for supporting the face-plate in use, the locking-flap partly separated from the face-plate by a score-line and provided with ears on each side cut from the material of the side wings, the side wings having openings therethrough to receive the locking-ears, the upper margins of said openings being longer than the lower margins thereof and the side margins being curved, substantially as and for the purposes set forth.

809,786. AUTOMATIC TRAP OR VALVE FOR DRAINING HEATING SYSTEMS. JAMES H. DAVIS, Chicago, Ill. Filed July 8, 1905. Serial No. 268,774.

Claim.—1. A device of the kind described, comprising a shell provided with an inlet, and with an outlet in the base, a float provided with a depending marginal edge and a valve inclosed by the marginal edge with its face above the horizontal plane of the lower extreme of the margin, in combination with a removable thimble for the outlet with its top forming a valve-seat elevated above the floor of the shell, and an air-duct extending from the outlet to the space above the line of flotation.

2. A device of the kind described, comprising a shell provided with an outlet positioned in its base, an inlet, and an inverted-cup-shaped float provided with a depending stem carrying a valve positioned above the horizontal plane of the lower margin of the float, in combination with a removable thimble in the outlet with its upper end extending above the floor of the shell and terminating in an elevated valve-seat and an air-duct extending from the outlet to the space above the line of flotation.

3. A device of the kind described, comprising a shell provided with an outlet positioned in its base, an inlet, a depending wall before the inlet extending below the horizontal plane of the same, and an inverted-cup-shaped float provided with a depending stem carrying a valve above the horizontal plane of the lower margin of the float, in combination with a removable thimble for the outlet arranged with its upper end extending above the floor of the shell in line with the valve and providing an elevated seat for the valve and an air-duct extending from the outlet to the space above the line of flotation.

4. A device of the kind described, comprising a shell provided with an outlet positioned in its base the opening to which is elevated above the floor of the shell, an inlet, a depending wall before the inlet extending below the horizontal plane of the same, in combination with an inverted-cup-shaped float provided with a depending stem with a valve on its lower end in line with the outlet and constructed to control the same and an air-duct extending from the outlet to the space above the line of flotation.

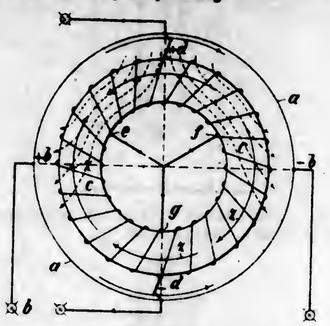
5. A device of the kind described, comprising a shell provided with an outlet positioned in its base, an inlet, a depending wall before the inlet extending below the horizontal plane of the same, and an inverted-cup-shaped float provided with a depending stem carrying a valve in line with the outlet, in combination with a removable thimble for the outlet arranged with its upper end extended above the floor of the shell providing an elevated seat for the valve, an air-duct extending from the outlet to the space above the line of flotation, and means for freeing the duct of dust.

6. A device of the kind described, comprising a shell provided with an inlet and an outlet, guiding-rods for a vertically-movable float, an air-duct extending from the outlet to and longitudinally through one of the guiding-rods and a removable thimble for the entrance to the outlet, in combination with a float provided with means loosely embracing the guiding-rods and provided with a part arranged to normally close the end of the thimble and control the discharge.

7. A device of the kind described, comprising a shell provided with an inlet and an outlet, guiding-rods for a vertically-movable float, an air-duct extending from the outlet to and longitudinally through one of the guide-rods, and a removable thimble for the entrance to the outlet, in combination with a float provided with means loosely embracing the guide-rods, and a depending rod carried by the float provided at its lower end with a part constructed to seat upon the end of the thimble to normally close the same and by the operation of the float to control the discharge.

809,787. ALTERNATING-CURRENT MOTOR. MAX DÉRI, Vienna, Austria-Hungary, assignor to Stanley Electric Manufacturing Company, Pittsfield, Mass. Filed May 2, 1904. Serial No. 206,027.

Claim.—1. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, and means for supplying exciting-currents to the rotor-winding to produce a field at an angle to that due to the primary winding.



2. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, and means for supplying to the rotor-winding currents in phase with the primary current to produce a field at an angle to that due to the primary winding.

3. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, commutator-brushes arranged on a line at an angle to the line of magnetization produced by the primary winding, and connections from said brushes to a source of current substantially in phase with the primary current.

4. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, commutator-brushes arranged on a line at an angle to the line of magnetization produced by the primary winding, connections from said brushes to a source of current substantially in phase with the primary current, and a reversing-switch in said connections.

5. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, commutator-brushes arranged on a line at an angle to the line of magnetization produced by the primary winding, and a transformer having its primary in series with the primary winding of the motor and its secondary connected to said brushes.

6. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at a number of points indivisible by the number of poles of the motor, commutator-brushes arranged on a line at an angle to the line of magnetization produced by the primary winding, a transformer having its primary in series with the primary winding of the motor and its secondary connected to said brushes, and a reversing-switch in circuit with one of the windings of said transformer.

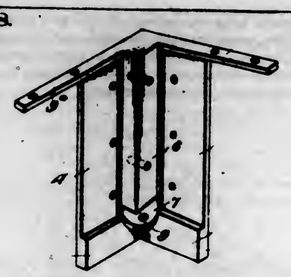
7. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at three points per pair of poles, and means for supplying exciting-currents to the rotor-winding to produce a field at an angle to that due to the primary winding.

8. In an alternating-current motor, a single-phase primary winding, a rotor-winding short-circuited at three points per pair of poles, commutator-brushes arranged on a line at an angle to the line of magnetization produced by the primary winding, and connections from said brushes to a source of current substantially in phase with the primary current.

809,788. VEHICLE-BODY CONSTRUCTION. STONEWALL J. DOWLING, Waxahachie, Tex. Filed July 5, 1905. Serial No. 268,767.

Claim.—An angle-iron for a buggy or vehicle body comprising an L-shaped member, a reinforce-strip arranged within the member at the junction of the sections, said member terminating at a point above the lower end of the member, a foot extending from the lower end of the member, arms extending from the upper edges of each of the sections of the members, the inner surfaces of each section being recessed intermediate its ends, said recess extending beyond the reinforce-strip; said sections, arms and reinforce-strip being provided with apertures.

809,788.



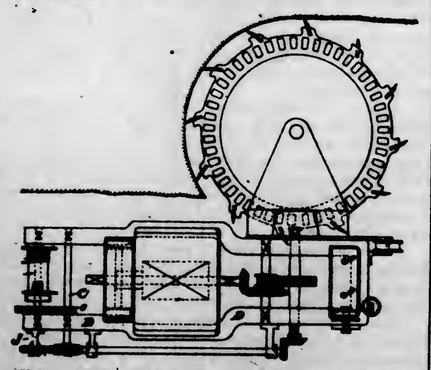
809,789. STOPPER-VALVE. ARTHUR T. DUNCAN, Clinton, Mo. Filed Oct. 17, 1905. Serial No. 283,151.

Claim.—1. A stopper-valve including an interiorly-threaded cap having side openings, and a packing member extending into and seated in said openings.

2. The combination with an exteriorly-threaded tubular member, of a threaded cap fitted thereto and having opposite side openings, and a packing member engaging said openings.

3. The combination with an exteriorly-threaded tubular member, of a cap having threaded engagement therewith and provided with oppositely-disposed side openings, and a packing member disposed within the cap for engagement with the extremity of the threaded tube and having its ends extended into the opposite side openings of the cap.

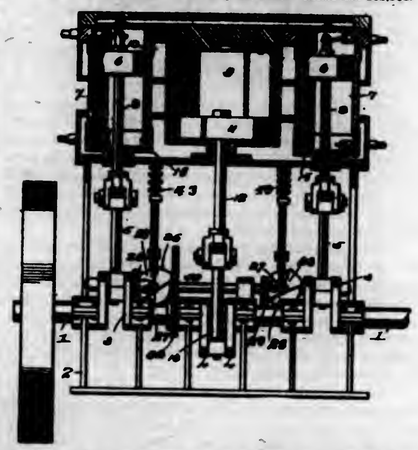
809,790. FEED FOR COAL-CUTTING MACHINES. FRANK BICKERSLEY, Crofton, near Wakefield, England. Filed Feb. 27, 1905. Serial No. 247,608.



Claim.—1. The combination of a bodily-movable coal-cutting machine, carrying a motor device thereon, with means for controlling the feed of said machine up to its work, said means including a drum, a hauling-rope passing over said drum, and gearing between said motor and said drum, said gearing including a worm-wheel loosely and slidably mounted on the drum-operating shaft and provided with a clutch member, a corresponding clutch member fastened to said operating-shaft, a spring normally holding said clutch members in engagement with each other, substantially as described.

2. The combination of a bodily-movable coal-cutting machine, carrying a motor device thereon, with means for controlling the feed of said machine up to its work, said means including a drum, a hauling-rope passing over said drum, and gearing between said motor and said drum, said gearing including a worm-wheel loosely and slidably mounted on the drum-operating shaft and provided with a clutch member, a corresponding clutch member fastened to said operating-shaft, a spring normally holding said clutch members in engagement with each other, and means for adjusting said spring, substantially as described.

809,791. COMPOUND GAS-ENGINE. JOHN W. ESSENHUTH, Brooklyn, N. Y., assignor to The Elizabeth Horseless Vehicle Co., a Corporation of Maine. Filed May 25, 1905. Serial No. 262,201.



Claim.—1. In a gas-engine, the combination with high-pressure cylinders, of a low-pressure cylinder adapted to be operated by the exhaust from the same, piston-valves mounted in pockets or recesses formed in the engine-casing between said cylinders for controlling the movement of the gaseous mixture, the said valves being arranged in pairs and moving upon each other in said pockets but controlling different ports, telescoping stems secured to the said valves, and cams for engaging the valve-stems so as to reciprocate the valves independently of each other, substantially as described.

2. In a gas-engine, the combination with suitable cylinders, of pistons moving therein for operating a power-shaft, piston-valves for regulating the admission of explosive compounds to the said pistons, the said valves occupying pockets or recesses formed in the engine-frame between the cylinders so as not to be exposed, two valves being arranged to move upon each other in each pocket or recess, valve-stems secured to said valves, one of the said valve-stems passing through the other so that the valves may be operated independently of each other, cams applied side by side upon a cam-shaft and extending in different directions upon the same for engaging the valve-stems to operate the valves, substantially as described.

3. In a gas-engine, the combination with suitable cylinders and pistons operating therein, of piston-valves for admitting explosive mixtures against each end of the said pistons, said valves being hollow and having flat adjoining faces working on each other so that one finds a bearing upon the other, each of the said valves having ports for permitting the gaseous mixtures to pass through them, each valve controlling a different set of ports, springs for moving the valves in one direction and cams for operating them in the other direction, substantially as described.

4. In a gas-engine, the combination with high-pressure cylinders and a low-pressure cylinder, of valves for admitting an explosive mixture to the said high-pressure cylinders, said valves being cylindrical and hollow, valves for discharging the vitiated gases from the said high-pressure cylinders into the low-pressure-cylinder, and valves for regulating the exhaust of the said low-pressure cylinder, said valves being semicylindrical in form and sliding upon each other, whereby they may be compactly mounted in the said engine, substantially as described.

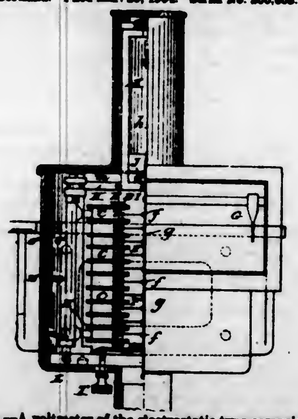
5. In a gas-engine, the combination of high-pressure cylinders, a low-pressure cylinder mounted between them and adapted to receive the exhaust from each end of each of the high-pressure cylinders, pistons moving in each of the said cylinders, piston-rods connecting the said pistons with a suitable power-shaft, electrodes mounted in each end of each high-pressure cylinder, counting electrodes secured to the piston-rods of the high-pressure cylinders and arranged upon each side of the pistons so as to explode the gaseous mixtures upon opposite sides of the pistons, valves arranged in pairs for controlling the gaseous mixtures in the engine, the engine-framing being provided with sockets for receiving the said valves, each pair of valves being adapted to just fill the diameter of the said sockets, the said valves also being formed of hollow casings having suitable ports formed therein and being provided with adjacent bearing-surfaces so that they slide upon each other, and means for moving the said valves independently of each other, substantially as described.

809,792. PIPE-COUPLING. JOHN P. BUSTA, Newton, Mass. Filed Dec. 2, 1904. Serial No. 235,127.

Claim.—1. A pipe-coupling comprising a metallic casing formed in one piece with a rectangular internal groove, providing an inner flange, an annular rim and an outer flange, and a contracted portion having a slightly-expanded end.

2. A pipe-coupling comprising a metallic casing formed in one piece with a rectangular internal groove providing an inner flange, an annular rim and an outer flange, and a contracted portion having a slightly-expanded end which terminates in an infolded reinforcing internal flange providing a rounded extremity to the casing.

809,793. ELECTROSTATIC VOLTMETER. JAMES FERGUSON, Glasgow, Scotland, assignor to Kelvin & James White, Limited, Glasgow, Scotland. Filed Mar. 20, 1904. Serial No. 200,603.



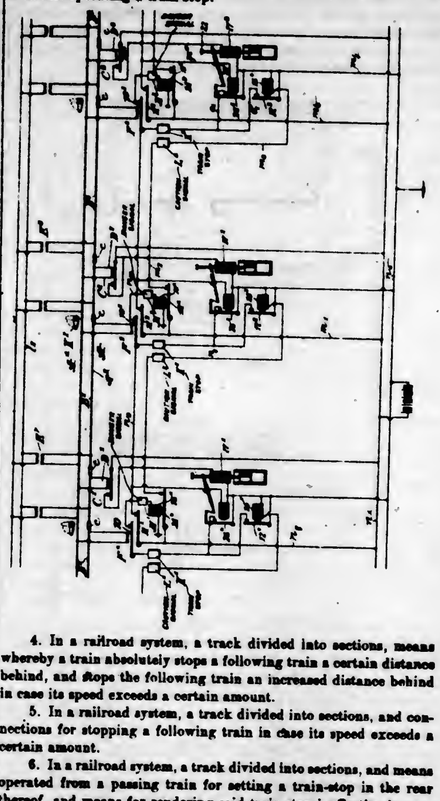
Claim.—A voltmeter of the electrostatic type comprising a case, a coating of insulating material on the interior surface of said case, a coating of conductive material on the interior surface of said insulating-coating, a fixed system of coils within said case, a vertical back of insulating material fitted to each set of fixed coils, a coating of conductive material on the exposed surface of said back, and a movable system of vanes to which the conductive coating of said backs is permanently connected.

809,794. RAILROAD SYSTEM. HANNIBAL C. FORD, Jamaica, N. Y. Filed Sept. 12, 1905. Serial No. 278,194.

Claim.—1. In a railroad system, a track divided into sections, and electrical connections for setting a train-stop absolutely to enforce a home or danger signal, but releasably to enforce a caution-signal depending on the speed of a following train.

2. In a railroad system, a track divided into sections, a train-stop corresponding to each caution-signal, and means whereby said train-stop is rendered ineffective when the speed of a following train falls below a certain amount.

3. In a railroad system, a track divided into sections, means whereby caution-signal circuits are successively opened by the passage of a train, each caution-signal circuit constituting a branch of a circuit operating a train-stop.



4. In a railroad system, a track divided into sections, means whereby a train absolutely stops a following train a certain distance behind, and stops the following train an increased distance behind in case its speed exceeds a certain amount.

5. In a railroad system, a track divided into sections, and connections for stopping a following train in case its speed exceeds a certain amount.

6. In a railroad system, a track divided into sections, and means operated from a passing train for setting a train-stop in the rear thereof, and means for rendering said train-stop ineffective in case the speed of the following train is below a certain value.

7. In a railroad system, a track divided into sections, and means operated from a passing train for setting a train-stop in the rear thereof, and means for rendering said train-stop operable only in case the speed of the following train exceeds a certain value.

8. In a railroad system, electrical connections for displaying a home signal in the rear of a train, means whereby such home signal displays a distant signal farther in the rear, a train-stop, and means whereby said train-stop is absolutely effective as long as the home signal is displayed and is effective for high-speed trains only as long as the distant signal is displayed.

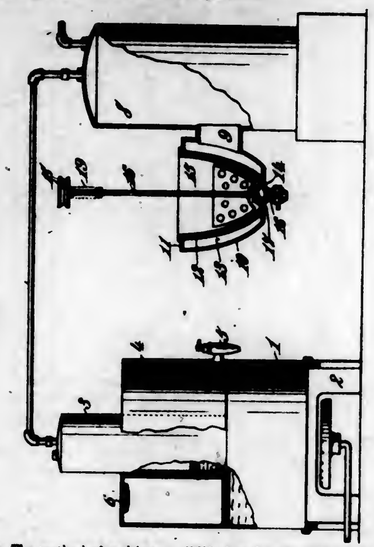
9. In a railroad system, a track divided into sections, means whereby said sections are short-circuited by the passage of a train, a magnet which releases a slowly-movable part actuated by the short-circuiting of one section, and a second magnet actuated by the following section for releasing its armature unless held up by said part.

10. In a railroad system, a track divided into sections, means whereby a train-stop is made effective at the entrance to a section, after, but not while, a train is located thereon, and means whereby said train-stop can be rendered ineffective by trains below a certain speed after the preceding train has traversed a certain distance.

11. In a railroad system, a track divided into sections, and means whereby a preceding train causes behind it a traveling zone of variable influence, and means whereby a following train is absolutely stopped or stopped in case its speed is too great, according to its penetration into such zone.

809,795. METHOD OF MAKING SOLIDIFIED ANTISEPTIC COMPOUNDS. DAVID GERBER, Baltimore, Md., assignor to Gerber Coral Manufacturing Company of West Virginia, Baltimore, Md. Filed Dec. 28, 1904. Serial No. 238,183.

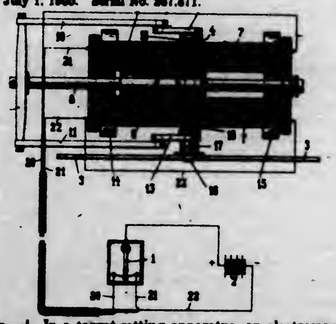
Claim.—1. The method of making a solidified antiseptic compound containing volatile ingredients which consists in subjecting a mixture of glycerin and stearate of soda to a temperature of about 220° Fahrenheit, then reducing said mixture to and maintaining it at a temperature of about 125° Fahrenheit and while at said temperature mixing therewith the volatile ingredients.



2. The method of making a solidified antiseptic compound containing stearoptens and alcohol, which consists in subjecting a mixture of glycerin and stearate of soda to a temperature of about 220° Fahrenheit then reducing the temperature of the mixture to and maintaining it at about a temperature of 125° Fahrenheit, and then while at such temperature mixing therewith the stearoptens and alcohol.

3. The method of making a solidified antiseptic compound containing stearoptens and alcohol, which consists in subjecting a mixture consisting of ninety-four parts, by weight, of glycerin and six parts, by weight, of stearate of soda to a temperature of about 220° Fahrenheit for from three to five hours, then reducing the temperature of the mixture to and maintaining it at about 125° Fahrenheit, and while at such temperature mixing therewith the stearoptens and alcohol.

809,796. ELECTRIC TARGET-SETTING APPARATUS. GUSTAV GRADENIGK, Berlin, Germany, assignor to Phœnix Elektrotechnische Gesellschaft M. B. H., Berlin, Germany, a Corporation of Germany. Filed July 1, 1905. Serial No. 267,671.



Claim.—1. In a target-setting apparatus, an electromagnet, a core slidable therein, and a target shiftable directly by said core.

2. An electromagnet, a core shiftable therein, and a target shiftable in either of two directions by said core.

3. An electromagnet, a core slidable therein, and a target partially rotatable by said core.

4. An electromagnet, a target, and means for transmitting oscillatory motion to the latter from the former.

5. An electromagnet, a core slidable therein, a target, and means for converting the reciprocatory movement of said core into an oscillatory movement and transmitting the latter to said target.

6. In a target-setting apparatus, an electromagnet, a core slidable therein, a spindle, a target mounted thereon, and means connecting said spindle and core whereby the former is partially rotated upon the actuation of said electromagnet.

7. In a target-setting apparatus, an electromagnet, a core slidable therein, a spindle, a target mounted on said spindle, a guide-rod carried by said core, a cross-head fixed to said guide-rod, cranks attached to said spindle, and connecting-rods connecting said cranks with said cross-head.

8. In a target-setting apparatus, an electromagnet, a core slidable therein, a spindle extending transversely through said electromagnet, cranks applied to said spindle at either side of said electromagnet, a reciprocatory cross-head operable by said core, connecting-rods connecting said cross-head with said cranks, and a target mounted on said spindle.

9. A target-setting apparatus including an electromagnet having two coils, a core movable in opposite directions by said coils when the same are energized, a shiftable target, and a connection between said target and said core.

10. A target-setting apparatus including an electromagnet having two coils arranged side by side, a core movable through said coils, a circuit for each of said coils, means for independently closing and opening each circuit, and a target in operative connection with said core.

11. An electromagnet, a target shiftable thereby, and hydraulic means in connection with said electromagnet for locking the target in position.

12. An electromagnet embodying a casing; a liquid contained in said casing, a core slidable in the electromagnet and movable through said liquid, a target shiftable by said core, and means for regulating the flow of said liquid from one part of said casing to another part thereof.

13. An electromagnet comprising a casing to contain a liquid, a core for said electromagnet movable in such liquid, a target shiftable by said core, a pipe connected at each end with said casing, and a valve in said pipe.

14. In a target-setting apparatus, a target, means for shifting the same, a hydraulic cushioning and locking means, and electrical means for controlling the latter.

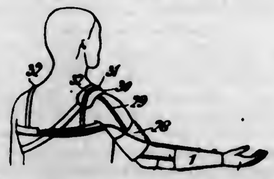
15. In a target-setting apparatus, a target, a device for shifting the same, a hydraulic stop device including a valve, and electrical means for operating said valve.

16. In a target-setting apparatus, a target, a device for shifting the same, a hydraulic cushioning device for the target including a valve, and an electromagnet the core of which is connected to said valve.

17. In a target-setting apparatus, a target, an electrical device for shifting the same, a stop device, and electrical means included in the circuit of said first device for operating said stop device.

18. In a target-setting apparatus, in combination, a target, an electromagnet for shifting the same, a circuit in which said electromagnet is included, means for locking said target against movement, and an electromagnet for actuating said locking means included in the circuit of said first electromagnet.

809,797. ARTIFICIAL HAND. ARCHIBALD GROGAN, London, England, assignor to Lionel Hanbury Webber, Onslow Gardens, England. Filed June 20, 1905. Serial No. 267,578.



Claim.—1. The combination with an artificial hand having articulated fingers, of flexible wires attached to the top joints of the fingers, means actuated by the expansion of the chest for pulling the wires, and coils formed in the length of the wires.

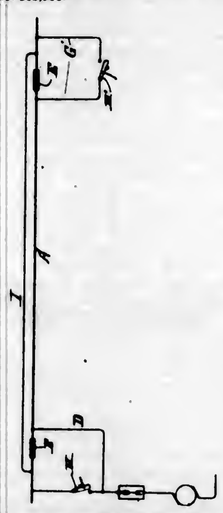
2. The combination with an artificial hand having articulated fingers, of an expansible band surrounding the chest, and connections between the band and the fingers.

3. The combination with an artificial hand having articulated fingers, of an expansible band surrounding the chest, a core connected to one end of the hand, a closely-coiled helix surrounding the core, and connections between the core and the fingers.

4. The combination with an artificial hand having articulated fingers, of an expansible band surrounding the chest, a core connected to one end of the hand, a closely-coiled helix surrounding the core, and spring connections between the core and the fingers.

5. The combination with an artificial hand having articulated fingers, of means actuated by the expansion of the chest for flexing the fingers, and means for clamping the fingers in the flexed position.

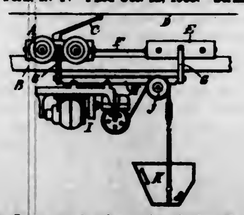
809,798. MEANS FOR CONTROLLING OVERHEAD ELECTRIC CARRIERS. HENRY M. HARDING, New York, N. Y. Filed Apr. 21, 1903. Serial No. 153,900.



Claim.—1. A means for controlling overhead electric carriers consisting of a main conductor, a section at each end thereof, a resistance between each of said sections and the main line of such a character that insufficient current flows through said sections to move the loaded carrier, and means for fully energizing said sections, substantially as described.

2. A means for controlling overhead electric carriers consisting of a main conductor, a section at each end thereof, a resistance between each of said sections and the main line of such a character that insufficient current flows through the said sections to move the loaded carrier, and means for fully energizing said sections from either end of the line, substantially as described.

809,799. OVERHEAD ELECTRIC CARRIER. HENRY M. HARDING, New York, N. Y. Filed Oct. 13, 1903. Serial No. 176,713.



Claim.—1. In an overhead carrying device, the combination of a telpher adapted to travel along a rail, a supporting-trailer connected to said telpher and also adapted to travel along said rail, a connecting device supported from and below the telpher and trailer, and a weight-carrying device.

2. In an overhead carrying device, the combination of a telpher adapted to travel along a rail, a supporting-trailer also adapted to travel along said rail, a connection between the telpher and the trailer, a spreader supported from the telpher and trailer and a hoisting and weight-carrying device, substantially as described.

3. In an overhead carrying device, the combination of a telpher adapted to travel along a rail, a supporting-trailer connected to said telpher and adapted to travel along said rail, a connecting-beam supported from said telpher and trailer, and a hoisting device carried by said connecting-beam, substantially as described.

4. In an overhead carrying device, the combination of a telpher adapted to travel along a rail, a supporting-trailer connected to said telpher and adapted to travel along said rail, a spreader connected to and suspended below said telpher and trailer and a hoisting and weight-carrying device also connected to the telpher and trailer, substantially as described.

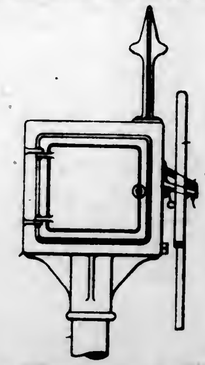
5. In an overhead carrying device, the combination of a telpher adapted to travel along a rail, a supporting-trailer connected to said telpher adapted to travel along said rail, and a beam supported from said telpher and trailer, substantially as described.

6. In an overhead carrying device, the combination of a telpher, a supporting-trailer connected to the telpher, said telpher and trailer being adapted to travel, links connected to the telpher and trailer, and a spreader connected to the links by a swivel connection, substantially as described.

7. In an overhead carrying device, the combination of a telpher and trailer, the telpher and trailer adapted to travel along a rail, a pivoted connection between the telpher and trailer, hangers extending from the telpher and trailer, and a spreader pivotally connected to the hangers.

8. In an overhead carrying device, the combination of a telpher and trailer, said telpher and trailer being adapted to travel along a rail, the telpher and trailer being pivotally connected to each other, hangers suspended from the telpher and trailer, a connecting-beam connected to the hangers by swivel-joints, and a hoisting device connected to said beam.

809,800. RAIN-GUARD FOR SIGNALS. REINHOLD HERMAN, Crafton, Pa., assignor to General Electric Company, a Corporation of New York. Filed June 14, 1905. Serial No. 265,164.



Claim.—1. In combination with a casing, a shaft extending through said casing, a rain-guard secured to said casing and extending over the outer end of said shaft, and a semaphore-casting supported from the outer end of said shaft, the portion of said casting engaging said shaft extending downward away from said guard so as not to engage therewith in the range of movement of said casting.

2. In combination with a casing, a shaft extending through said casing, a semaphore-casting carried on said shaft outside said casing, and a rain-guard secured to said casing and extending over said shaft and through an aperture in said casting.

3. In combination with a casing, a shaft extending through said casing, a semaphore-casting carried on said shaft outside said casing, and a rain-guard secured to said casing and extending over the entire length of said shaft, said casting being provided with an aperture to permit the guard to pass through it.

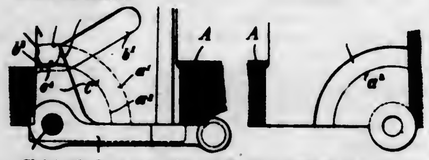
4. In combination with a casing, a shaft extending through said casing, a semaphore-casting carried on said shaft outside said

casing, and a rain-guard secured to said casing extending over said shaft and through an aperture in said casting and provided with lateral gutters adapted to discharge water at the outer end of said guard

5. In combination with a casing, a shaft extending through said casing, a semaphore-casting carried on said shaft outside said casing, and a rain-guard secured to said casing extending over said shaft and through an aperture in said casting and provided with lateral gutters adapted to discharge water at the outer end of said guard and having a depending flange at its outer end.

6. In combination with a casing, a shaft extending through said casing, a semaphore-casting carried on said shaft outside said casing, and a rain-guard secured to said casing extending over the entire length of said shaft and arranged to discharge water at its outer end, said semaphore-casting being provided with an aperture to permit the guard to pass through it.

809,801. LEVER-ACTUATED WEDGE BREECH-BLOCK. MAX HERBORN, Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Mar. 31, 1905. Serial No. 253,602.



Claim.—1. In a gun, the combination with the breech, the breech-block, and the operating-lever journaled in one of said parts and engaging the other part by its free end, of a boss on said free end of the operating-lever, the part in which the lever is journaled being provided with a curved groove in which said boss engages, whereby the shock caused by firing the gun is transmitted directly to the breech and removed from the fulcrum of the operating-lever.

2. In a gun, the combination with the breech, and the breech-block, of the operating-lever journaled in one of said parts and having connection with the breech-block to move it transversely of the bore of the gun, the said part having a groove concentric with the journal of the operating-lever, and means on the lever movable in the concentric groove.

3. In a gun, having a breech-block and an operating-lever journaled in the breech and engaging the breech-block by its free end; a boss on said free end of the operating-lever, and a curved groove in the breech engaged by said boss whereby the shock caused by firing the gun is transmitted directly to the breech and removed from the fulcrum of the operating-lever.

4. In a gun having a fulcrumed crank-lever and a wedging breech-block, formed with a groove engaged by a stud on the free end of the crank-lever; a boss formed on the side of the free end of the crank-lever opposite the stud, and a groove formed in the side wall of the gun-breech, concentric with the crank-lever fulcrum, and engaged by the boss when the breech is closed, whereby the effect of firing is transmitted directly through the stud and boss to the breech.

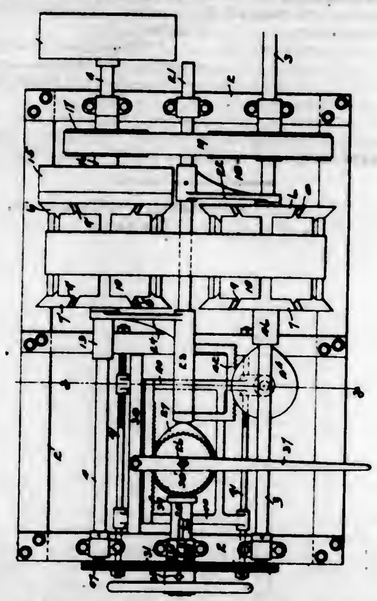
5. In a gun, the combination with the breech, the breech-block, the operating-lever journaled in the breech, and means on one side of the lever engaging the breech-bolt to transmit motion thereto, of means on the opposite side of the lever engaging the breech to transmit to the breech the shock imparted to the lever and relieve the fulcrum thereof.

809,802. VARIABLE-SPEED MECHANISM. SILAS L. HESTWOOD, Minneapolis, Minn. Filed June 12, 1904. Serial No. 212,262.

Claim.—1. The combination, with two expansible pulleys one having sliding heads and the other a sliding and a non-sliding head, the sliding head of the latter pulley being free to recede from the other head by the tension of the belt to contract the pulley, of means for moving the heads of the former pulley in the same direction but at different speeds to expand that pulley.

2. The combination, with the expansible pulleys, one having sliding heads and the other a sliding and a non-sliding head, a belt connecting said pulleys, the sliding head of one pulley receding from its non-sliding head under tension of the belt to contract the pulley, of a cam mechanism arranged to move the heads of the other pulley in the same direction but at different speeds to expand that pulley.

3. The combination, with an expansible pulley having sliding heads, of a second expansible pulley having one sliding and one non-sliding head, a belt connecting said pulleys, and mechanism for expanding one pulley and allowing a corresponding contraction of the other, substantially as described.



4. The combination, with the expansible pulleys, one having sliding heads and the other a sliding and a non-sliding head, and a belt connecting said pulleys, of mechanism for moving the sliding head of one pulley toward its stationary head to expand the pulley and for moving one sliding head of the other pulley toward the other sliding head of the same pulley and allowing said other sliding head to recede under tension of the belt at a greater speed to contract the the pulley.

5. The combination, with the expansible pulleys and a connecting-belt, of pivoted cams, mechanism arranged to rotate said cams and to contract one pulley and expand the other, and mechanism for moving said cams without rotating them to contract or expand both of said pulleys simultaneously.

6. The combination, with a shaft, of an expansible pulley having sliding heads thereon, a second shaft, a second expansible pulley having a sliding and a non-sliding head, a belt connecting said pulleys, and an arm engaging one of the sliding heads of said first-named pulley, means engaging the other sliding head of said first-named pulley and the sliding head of the second pulley to move them toward their opposite heads to expand said second-named pulley and also move said arm to allow the tension of the belt to separate the heads of said first-named pulley and contract it, substantially as described.

7. The combination, with a shaft, of an expansible pulley having sliding heads thereon, a second shaft and a second expansible pulley having a sliding and a non-sliding head, a belt connecting said pulleys, a longitudinally-movable rod provided with an arm arranged to engage one of the heads of said first-named pulley, and mechanism for moving the opposite sliding head of said first-named pulley toward the other head and also moving said arm at a greater speed to release said other head and allow the contraction of said first-named pulley and also moving the sliding head of said second-named pulley toward its non-sliding head, substantially as described.

8. The combination, with a shaft, of an expansible pulley having sliding heads thereon, a second shaft and a second pulley having a sliding and a non-sliding head, a belt connecting said pulleys, arms engaging one of the sliding heads of said first-named pulley and the sliding head of said second-named pulley upon opposite sides of their respective pulleys, and mechanism for moving said arms in the same direction to expand one pulley and contract the other.

9. The combination, with an expansible pulley having sliding heads, of a second expansible pulley having a sliding and a non-sliding head, a belt connecting said pulleys, means for moving the sliding head on one pulley toward its non-sliding head to expand that pulley and allowing the separation of the sliding heads of the other pulley to contract it, and cam devices provided in connection with said moving means, substantially as described.

10. The combination, with a shaft, of an expansible pulley having sliding heads thereon, a second shaft and a second expansible pulley having a sliding and a non-sliding head, a belt connecting said pulleys, a longitudinally-movable rod provided with an arm engaging one of the sliding heads of said first-named pulley, a cam engaging the opposite head of the same pulley, an arm loosely mounted on said rod and engaging the sliding head of said second-named pulley, a sleeve having a longitudinal movement with said rod, a second cam arranged between and engaging said sleeve and loosely-mounted arm, and mechanism for rotating said cams simultaneously and to move said rod lengthwise to expand one pulley and contract the other.

11. The combination, with the expansible pulleys, one having two sliding heads and the other having a sliding and a non-sliding head, of a cam mechanism arranged to move one of the two sliding heads of one pulley toward the other head of the same pulley and allowing said other head to move in the same direction but at a greater rate of speed and also moving the one sliding head toward its non-sliding head, substantially as described.

12. The combination, with the expansible pulleys and a connecting-belt, of mechanism for moving the head of one pulley toward its opposite head to cause the expansion of that pulley and simultaneously moving both heads of the other pulley in the same direction but at different speeds to contract that pulley.

13. The combination of two expansible pulleys, one having sliding heads and the other a sliding and non-sliding head, the sliding head of the latter pulley being free to recede from the other head through the tension of the belt to contract that pulley, of mechanism operating during a portion of its movement to move the heads of the former pulley in opposite directions to expand that pulley.

809,803. NAIL-PULLER. WILLIS F. HOUSE, Bridgeport, Conn., assignor to The Bridgeport Hardware Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed June 5, 1905. Serial No. 263,719.

Claim.—In an implement of the character described, the combination with a handle comprising a handpiece and a barrel having internal grooves and shoulders at the lower ends of said grooves and having holes through its sides near the upper end of the barrel, a nail-puller having a shank of substantially uniform diameter, said shank having surface scorings at a distance from its upper end greater than the depth of the space within the barrel and having a cross-pin the ends of which are fitted to slide in the grooves of the barrel, and a guard comprising a metal washer having the edge of its central opening rigidly engaged with said scorings of the shank.

809,804. CONTAINER-PUNCH. WILLIS F. HOUSE, Bridgeport, Conn., assignor to The Bridgeport Hardware Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed June 5, 1905. Serial No. 263,720.

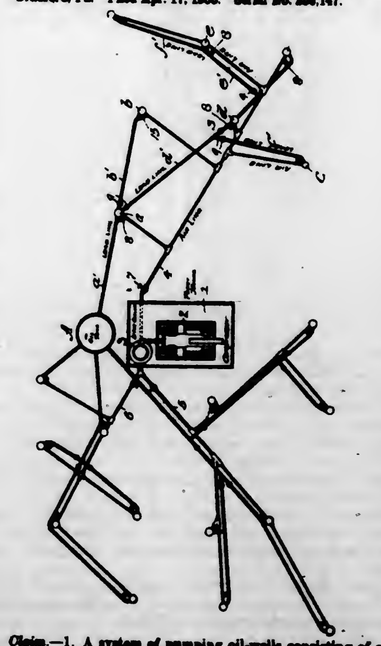
Claim.—1. In a device of the character described, the combination with an inverted-U-shaped die-jaw, of a cover having side pieces which lie on the outer side of the jaw and form shoulders to facilitate opening of the cover, for the purpose set forth, and a spring for retaining the cover in either the open or closed position.

2. In a device of the character described, the combination with an inverted-U-shaped die-jaw, of a cover pivoted to the jaw and having slots which receive the side walls of the jaw, a tongue lying within the jaw and side pieces lying on the outer sides of the jaw and form shoulders to facilitate opening of the cover and a spring for retaining the cover in either the open or closed position.

3. In a device of the character described the combination with an inverted-U-shaped die-jaw, of a cover hinged to the jaw and having a tongue lying within the jaw and a spring secured to the jaw, the free end of which passes through the tongue and is provided with an oblique bend, the angles of which act to retain the cover in either the open or closed position.

4. In a device of the character described, the combination with a U-shaped die-jaw having a depression at the pivotal point and between the walls of the depression a washer, of a cover hinged to the jaw and having a tongue lying within the jaw and a spring upon the jaw, one end of which engages the washer, the other end passing through the tongue of the cover and having an oblique bend, the angles of which act to retain the cover in either the open or closed position.

809,805. SYSTEM FOR PUMPING OIL-WELLS. ROSS J. HOFFMAN, Bradford, Pa., assignor to Hoffman Manufacturing Company, Bradford, Pa. Filed Apr. 17, 1905. Serial No. 256,147.



Claim.—1. A system of pumping oil-wells consisting of a plurality of pumps, a pipe or main for conveying compressed air, branches leading therefrom to the several pumps, lead-lines for con-

veying oil from the several pumps, connections between the said lead-lines and the compressed-air supply-pipe for introducing compressed air into the lead-lines, substantially as described.

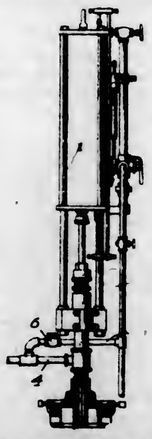
2. A system of pumping oil-wells consisting of a plurality of pumps, means for supplying compressed air, branches leading therefrom to the several pumps, lead-lines for conveying oil from the several pumps, connections between the said lead-lines and the compressed-air pipes for introducing air into the lead-lines and a single valve for controlling the compressed-air supply to the several pumps, substantially as described.

3. In combination, in an oil-well system, a plurality of pumps, lead lines for conveying the oil from the said pumps, said lead-lines being in connection with each other to convey the oil to one delivery-point, means for introducing compressed air into the lead-lines, and check-valves in the lead-lines to prevent back pressure, substantially as described.

4. A system of pumping a plurality of oil-wells comprising a pump for each well driven positively on both strokes and having means for adjusting the action of each pump to the capacity of its well in relation to the capacity of the other wells, a source of power for operating the pumps, pipe-lines extending from the source of power to the pumps and a single controlling-valve to control the supply of power to all the pumps whereby wells of varying capacity may be pumped off in the same period of time and the pumps started or stopped by the manipulation of a single controlling-valve

5. In a system of pumping oil-wells, the lead-lines, compressed-air pipes and a valve having a large and small passage therethrough, said small opening being adapted in size to admit sufficient air for liquefying the gas and the large opening admitting enough air to clear the oil-delivery pipe, substantially as described.

809,806. METHOD OF PRODUCING OIL FROM OIL-WELLS. ROSS J. HOFFMAN, Bradford, Pa., assignor to Hoffman Manufacturing Company, Bradford, Pa. Filed Apr. 17, 1905. Serial No. 256,148.



Claim.—1. The herein-described method consisting in introducing compressed air into the oil from the well to thereby condense the gas associated with said oil, substantially as described.

2. The herein-described process of recovering oil from the gas associated with oil discharged from gas-wells consisting in introducing compressed air into the said oil, substantially as described.

3. The herein-described process consisting in introducing compressed air into the oil-delivery pipe leading from the gas-well, substantially as described.

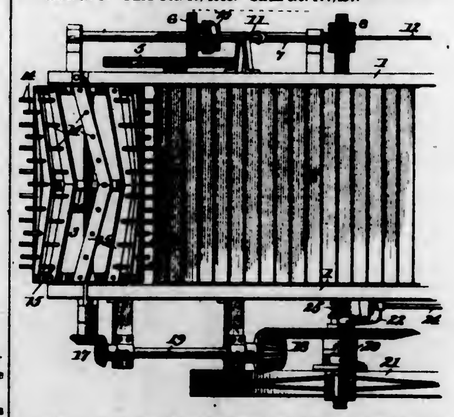
4. The herein-described process consisting in pumping the oil-well by a compressed-air-driven pump and introducing a part of the compressed-air supply into the oil-delivery pipe, substantially as described.

5. The herein-described method, consisting in pumping the oil from the well and introducing compressed air into the pumped oil to condense the gases, substantially as described.

809,807. SPADE. BENJAMIN C. JEWETT, Ridgegrove, Iowa. Filed July 3, 1905. Serial No. 268,694.

Claim.—A skeleton spade formed of two parts and consisting of a head having integral tine-sections and a sharpened blade having integral tine-sections, the tine-sections of the head and blade being permanently connected at points between the center and head of the spade and the tines formed by the sections being of constantly-decreasing thickness from the head to the blade, one of said tines having beveled side faces.

809,808. FERTILIZER-DISTRIBUTER. CHARLES JOHNSON, Cortland, N. Y. Filed Oct. 17, 1903. Serial No. 177,437.

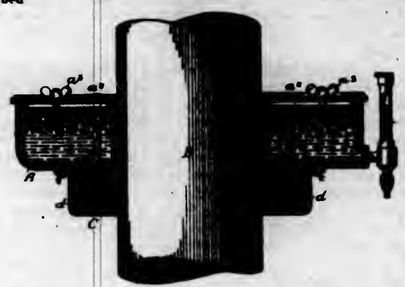


Claim.—1. A fertilizer-distributer comprising a spreader provided with an end piece provided with peripheral recesses at each end and a head midway the ends, slats secured at their outer ends in the recesses of one of the end heads and at their inner ends to the central head, the slats at one end of the spreader being arranged at an angle to those at the opposite end, and teeth carried by the said slats.

2. In a fertilizer-distributer, the combination with a vehicle-body and an axle, and wheels for supporting the same; of a shaft journaled at one end of the body, means for transmitting rotary motion thereto from an axle, heads upon the shaft, oppositely-disposed series of slats secured upon the heads, said series being arranged at angles to each other, and teeth extending from the slats.

809,809. PLUNGER-LUBRICATOR. LOUIS A. B. JOHNSON, Philadelphia, Pa. Filed Mar. 30, 1905. Serial No. 252,696.

Claim.—1. The combination with a substantially vertical rod to be lubricated, of an annular container forming a reservoir extending around the same, but constructed to retain lubricant out of direct contact with said rod and a secondary container in communication with and under the first container, said second container alone having an opening onto the surface of the rod substantially as described



2. The combination with a substantially vertical rod to be lubricated, of an annular container surrounding said rod and opening onto the same, and a reservoir having a plurality of valve-controlled openings in communication with said container, substantially as described.

3. The combination with a substantially vertical rod to be lubricated, of two annular containers extending around said rod, one over the other, the upper container having an opening or openings into the lower container and said lower container opening directly onto the rod, substantially as described.

4. The combination with a substantially vertical rod to be lubricated, of a reservoir for lubricant extending around the rod, an annular container connected to the reservoir by a passage other than along said rod, said container surrounding and opening onto the rod, with a body of packing in the container in engagement with the rod, substantially as described.

5. The combination with a substantially vertical rod to be lubricated, of a reservoir for lubricant, an annular container having a plurality of openings from said reservoir and surrounding and opening onto the rod, with a body of packing in the container, and means extending in the container between its wall and the packing for pressing the latter into engagement with the rod, substantially as described.

6. The combination with a substantially vertical rod to be lubricated, of a reservoir constructed to hold lubricant out of direct contact with said rod, an annular container connected thereto by a passage or passages other than along said rod, said container surrounding and opening onto the rod and having within it a body of packing, with an annular spring extending between said packing and the wall of the container for pressing the packing into engagement with the rod, substantially as described.

7. The combination with a substantially vertical rod to be lubricated, of an annular reservoir, and an annular container surrounding the rod having an opening onto the rod, with a valve or valves for controlling the flow of fluid from the reservoir to said container, substantially as described.

8. The combination with a substantially vertical rod to be lubricated, of an annular reservoir and an annular container both extended around the rod, said container having within it a body of packing in engagement with said rod, with a valve or valves for controlling the flow of fluid from the reservoir to the container, substantially as described.

9. The combination with a substantially vertical rod to be lubricated, of two annular containers extending around said rod and disposed one over the other, one of said containers opening onto the rod and communicating with the other container through openings in the bottom thereof, with a valve or valves for controlling the flow of fluid through said openings, substantially as described.

10. The combination with a substantially vertical rod to be lubricated, of a reservoir, a container so disposed as to deliver lubricant to the rod, there being a passage or passages connecting said reservoir and the container, with a valve or valves for controlling the flow of fluid through said passage or passages, and automatic mechanism actuated by the rod for controlling the operation of said valves, substantially as described.

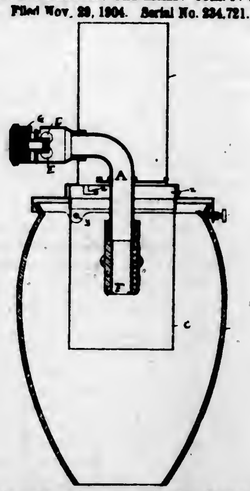
11. The combination with a substantially vertical rod to be lubricated, of a reservoir, an annular container extending around said rod, a valve or valves for controlling the flow of fluid from the reservoir to said container, and a roller or rollers in engagement with the rod operatively connected to said valve or valves, substantially as described.

12. The combination with a substantially vertical rod to be lubricated, of a reservoir, a container having an opening onto the rod, there being passages between the reservoir and the container, a valve or valves controlling the flow of fluid through said passages, a roller having means pressing it against the rod, and a disk frictionally held in engagement with the roller and operatively connected to the valve or valves, substantially as described.

13. The combination with a substantially vertical rod to be lubricated, of a reservoir, a container opening onto the rod, a series of valves controlling passages between the reservoir and the container, a series of rollers adjacent to the rod, means for pressing the rollers into engagement with the rod, friction-disks for the rollers, and rods connecting said disks with the valves, substantially as described.

14. The combination with a substantially vertical rod to be lubricated, of a reservoir, a container opening onto the rod, and under said reservoir, a valve controlling a passage between the reservoir and the container, a roller operatively engaging the rod, and clutch mechanism connecting the roller and the valve, with means for preventing opening of the valve except when the rod moves in a predetermined direction, substantially as described.

809,810. INCANDESCENT GAS-LAMP. JOHN F. W. JOST, Philadelphia, Pa. Filed Nov. 29, 1904. Serial No. 234,721.



Claim.—1. In an incandescent gas-lamp, a Bunsen burner having a downwardly-opening mouth and provided with air-inlets, and a chimney surrounding the lower portion of said burner and extending below the level of said mouth and having an air-inlet below said level so as to cause the mantle carried at said burner-mouth to be struck by an upward current of air which envelops the outside of the mantle, the tube of said burner passing through the wall of said chimney with a tight fit, and the air-inlets of the Bunsen burner being located exteriorly of the chimney which thus forms a shield interposed between said air-inlets and the path of the combustion products.

2. In an incandescent gas-lamp, a Bunsen burner having a downwardly-opening mouth and provided with air-inlets, and a chimney surrounding the lower portion of said burner and having an air-inlet at the bottom, so as to cause the mantle carried at said burner-mouth to be struck by an upward current of air which envelops the outside of the mantle, the tube of said burner passing through the wall of said chimney with a tight fit, and the air-inlets of the Bunsen being located exteriorly of the chimney which thus forms a shield interposed between said air-inlets and the path of the combustion products.

3. In an incandescent gas-lamp, a chimney for creating a current of air, a Bunsen burner having a downwardly-opening mouth

located in said air-current so that the mantle located at said mouth

located in said air-current so that the mantle located at said mouth will be struck and enveloped by said upward current of air, the tube of said burner passing through the chimney-wall and being provided with air-inlets exteriorly thereof, so that the chimney forms a shield interposed between said air-inlets and the path of the combustion products.

809,811. DEVICE FOR RENDERING BOTTLES NON-REFILLABLE. PIERRE JOFFRE, Paris, France. Filed Apr. 15, 1905. Serial No. 255,670.

Claim.—1. In a device for preventing the refilling of bottles, the combination of a casing, a member arranged in said casing and having a valve-seat in the bottom thereof, there being passages extending laterally from said valve-seat and upwardly at the sides of said member, a valve coöperating with said valve-seat, and means carried by the casing for unseating said valve when the bottle is tilted.

2. In a device such as described, the combination, with a casing, of a cup-shaped member arranged therein and provided in its bottom with a valve-seat, there being passages leading laterally from said valve-seat and upwardly at the sides of said member, a valve coöperating with said valve-seat, a member covering said cup, a spring interposed between said covering member and said valve, and gravity-actuated means for unseating said valve against the tension of said spring.

809,812. PAPER BOTTLE, CUP, OR OTHER CONTAINER. JAMES C. KINNEY, Philadelphia, Pa., assignor to American Paper Bottle Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Jan. 21, 1905. Serial No. 242,127.

Claim.—1. As a new article of manufacture a tubular body portion having an internal flat flange at one end forming with the side wall a straight annular cavity, a bottom having a flat flange, said bottom fitting tightly against the inner walls of the body and its flange extending into the annular cavity of the body, with a solid locking-disk pressed into the cavity formed by the body and bottom so as to force the end of the flange of the body against the flange of the bottom at a point close to the bottom, substantially as described.

2. As a new article of manufacture a tubular body portion having an internal flat flange at one end forming with the side wall a straight annular cavity, a bottom having a flat flange, said bottom fitting tightly against the inner walls of the body and its flange extending into the annular cavity of the body, with a solid locking-disk pressed into the cavity formed by the body and bottom so as to force the end of the flange of the body against the flange of the bottom at a point close to the bottom, a cementing material applied between the flange of the body and the flange of the bottom, substantially as described.

3. As a new article of manufacture a tubular body portion having an internal flat flange at one end forming with the side wall a straight annular cavity, a bottom having a flat flange, said bottom fitting tightly against the inner walls of the body and its flange extending into the annular cavity of the body, with a solid locking-disk pressed into the cavity formed by the body and bottom so as to force the end of the flange of the body against the flange of the bottom at a point close to the bottom, a cement applied to the corners of the bottom so as to cement the flange of the body to the flange of the bottom, and the locking-disk to the bottom, substantially as described.

4. As a new article of manufacture a tapered tubular body portion narrower at the bottom than at the top, and having an internal flat flange bent up from the bottom forming with the side wall a straight annular cavity, a bottom portion having a depending flat flange extending into the annular cavity of the body, and fitting tightly against the walls of the body, with a locking-disk less in thickness than the depth of the flange of the body and having a straight edge, said locking-disk forced into the cavity formed by the body and bottom, whereby the flange of the body is forced hard against the flange of the bottom at a point close to the bottom so as to make a tight fit between the bottom and the body, the tapered extension of the body preventing the displacement of the disk, substantially as described.

809,813. MANUFACTURE OF PAPER BOTTLES, CUPS, &c. JAMES C. KINNEY and HENRY R. HEYL, Philadelphia, Pa., assignors to American Paper Bottle Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Jan. 27, 1905. Serial No. 243,969.

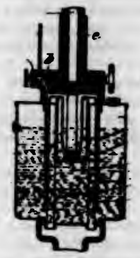
Claim.—1. The process herein described of manufacturing paper receptacles, said process consisting in making a tube, turning a flange on one end of the tube to form a straight annular cavity, forcing a flanged bottom into the tube from the opposite end to that flanged, so that the flange of the bottom will rest in the straight annular cavity, and forcing a locking-block into the flanged end of the tube under pressure whereby the flange of the tube is held to the flange of the bottom by the locking-block, substantially as described.

2. The process herein described of making tubular receptacles, said process consisting in making a paper tube, flanging one end of said tube to form a straight annular cavity, forcing a flanged bottom partly into the tube from the opposite end to that flanged, placing cement in the corner of the flanged bottom and forcing the flanged bottom farther into the tube so that the flange of the bottom will fit snugly in the straight annular cavity of the tube, forcing a locking-disk into the flanged end of the receptacle so as to press the flange of the body portion of the cylinder against the flange of the bottom at a point near the bottom, the cement fastening the flange of the body portion to the flange of the bottom, and the locking-disk to the bottom, substantially as described.

3. The process herein described of making tubular receptacles, said process consisting in making a paper tube, flanging one end of said tube to form a straight annular cavity, forcing a flanged bottom, with cement applied to the corner of said flanged bottom, into the tube so that the flange of the bottom will fit snugly in the straight annular cavity of the tube, forcing a locking-disk into the flanged end of the receptacle so as to press the flange of the body portion of the tube against the flange of the bottom at a point near the bottom, the cement fastening the flange of the body portion to the flange of the bottom, and the locking-disk to the bottom, substantially as described.

809,814. APPARATUS FOR AUTOMATICALLY LIGHTING GAS-LAMPS. WILHELM KNOLL, Königswusterhausen, Germany. Filed Aug. 22, 1905. Serial No. 275,282.

Claim.—1. In apparatus for automatically lighting from a pilot-jet and extinguishing gas-lamps by means of the variations of the pressure in the mains which contains a float carrying a mercury seal for closing and opening a dip-pipe through which gas is supplied by the main burner.



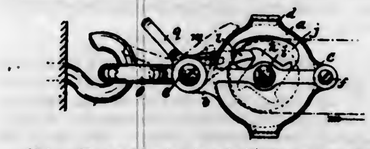
2. The arrangement of the dip-pipe in such a manner that it can be raised and lowered from the outside of the float-chamber for the purpose of adjusting the seal.

3. The arrangement of the float with a deep cup in its top containing the mercury seal and of a dip-pipe that can be raised and lowered from the outside of the float-chamber.

4. The arrangement of a dip-pipe provided with a screw-threaded part screwed into a tapped hole in the cover of the float-chamber and of a detachable socket carrying the burner-head round the upper part of the dip-pipe for the purpose of adjusting the dip-pipe by turning it after removal of the socket.

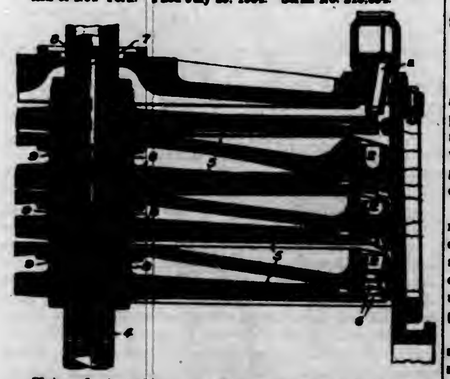
5. The arrangement or combination of a dip-pipe screwed through a tapped hole in the cover of the float-chamber, a socket or bush rotatably mounted on said cover, means adapted to turn the dip-pipe round by turning the socket or bush and means adapted to lock the socket or bush on the cover.

809,815. CLOTHES-LINE PULLEY. HANNA KOCHER, Paterson, N. J. Filed Mar. 31, 1905. Serial No. 253,106.



Claim.—The combination, in a clothes-line pulley, of the pulley-block, the pulley proper journaled therein, a pawl-and-ratchet connection between the pulley-block and the pulley proper, and a rope-holding dog carried by the pawl and projecting into proximity to the perimeter of the pulley, substantially as described.

809,816. ELASTIC-FLUID TURBINE. AUGUST H. KRUSE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 20, 1904. Serial No. 217,094.



Claim.—1. A turbine comprising a casing, a shaft therein which tends to expand less rapidly than the casing, sets of buckets on the shaft, devices for discharging motive fluid against the buckets, and ports in the shaft which are disposed out of the path of the fluid passing from one set of buckets to another for admitting fluid to the shaft to accelerate the heating and expansion thereof.

2. An elastic-fluid turbine which is divided into stages, each stage being provided with a wheel-compartment, bucket-wheels in the compartments, a shaft for the wheels which tends to expand at a different rate from the walls of the stages, devices for admitting fluid to and directing its passage through the stages, and a means for causing the shaft to expand substantially with and at the same rate as the walls of the stages.

3. A turbine comprising stages, each stage having a wheel-compartment, bucket-wheels in the compartments, a shaft for the wheels extending axially through the stages which tends to expand at a different rate from the latter, discharging devices arranged to deliver motive fluid against the buckets and cause the fluid to traverse a path parallel to the shaft and adjacent the walls of the stages, and means for acting on the shaft in a manner to cause it to expand substantially simultaneously with and at the same rate as the stages.

4. A multistage turbine having a tubular shaft containing ports communicating with the several stages to permit the idle fluid therein to pass through the shaft from a point of high to a point of low pressure, and means for closing the bore of the shaft between two or more of said stages.

5. A multistage turbine having a tubular shaft containing ports communicating with the several stages, and means for automatically closing the bore of the shaft between two or more stages when the shaft has expanded a certain amount.

6. A multistage turbine having a tubular shaft containing ports communicating with the several stages, and a thermostatic valve for closing the bore of the shaft between two stages.

7. A multistage turbine having a tubular shaft containing ports communicating with the several stages, a thin metallic tube in the bore of said shaft, a valve carried by said tube, and a valve-seat in the shaft.

8. A multistage turbine having a casing which expands more rapidly in the high-pressure stages than in the low, a wheel-carrying shaft extending through the stages which is located out of the normal path of the motive fluid and tends to expand less rapidly than the casing, and a means for heating the portion of the shaft in the high-pressure stage or stages to a greater extent than the portion in the low-pressure stage.

9. A turbine comprising a casing, diaphragms therein which divide it into compartments, a shaft extending axially through the casing which tends to expand less rapidly than the latter, bucket-wheels in the compartments which are carried by the shaft, and a conduit in the shaft which connects a point of high pressure in the casing with a point of low pressure for causing motive fluid to pass therethrough for heating the shaft to accelerate its expansion.

10. A multistage turbine, comprising a casing and a wheel-carrying shaft, one of which expands more rapidly than the other owing to the difference in surfaces exposed to the motive fluid, and a means which utilizes the idle fluid in one or more stages for subjecting one of said turbine elements to the heating effects of said fluid to reduce the tendency to unequal expansion.

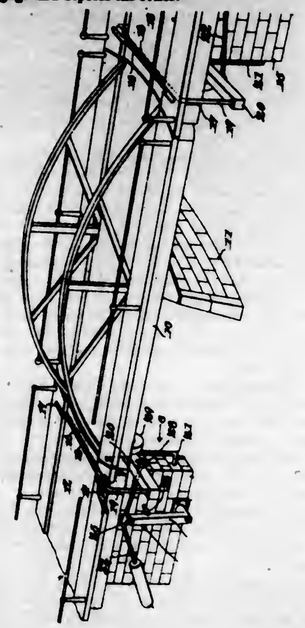
809,817. SAFETY-GATE FOR DRAWBRIDGES. JOHN B. LAMBOIS, Brussels, Wis., assignor of one-half to Gabriel Pierre, Brussels, Wis. Filed Sept. 1, 1905. Serial No. 276,748.

Claim.—1. The combination with a drawbridge of an abutment, a gate vertically slidable adjacent the end of the abutment, a strut pivotally connected at its lower end to the abutment, a lever pivoted upon the upper end of the strut and with one end pivotally connected with the gate, a weight carried on the end of the lever opposite the gate, a roller mounted on the gate and a cam carried by the bridge disposed to engage and depress the roller.

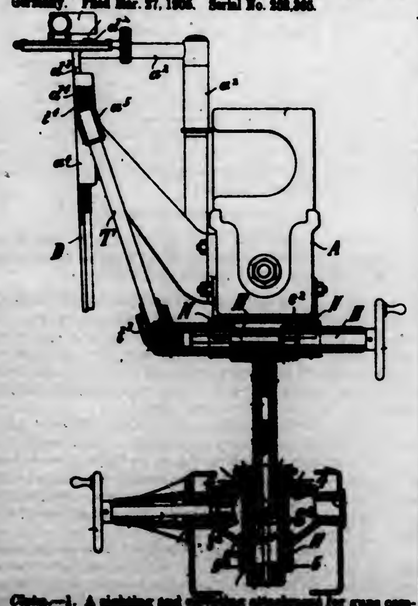
2. The combination with a drawbridge of an abutment, a beam mounted transversely and movable vertically of the abutment, a gate carried by the beam, a strut pivoted at its lower end to the abutment, a lever fulcrumed upon the strut and at one end to the beam, a weight carried by the lever at the end opposite the beam, a roller mounted upon the beam and a cam carried by the bridge-span disposed to engage and depress the roller.

3. The combination with a drawbridge of an abutment, a guide secured to the abutment, a beam slidably mounted and vertically movable upon the guide and disposed transversely of the bridge, a gate carried upon the beam, a strut pivoted at its lower end to the abutment, a lever fulcrumed upon the strut and with one end pivot-

ed to the beam, a weight carried by the lever at the end opposite the beam, a roller mounted upon the beam and a cam carried by the bridge to engage and depress the roller.



809,818. ELEVATING AND SIGHTING ATTACHMENT FOR GUNS. OTTO LAUBER and FRIEDRICH STOCK, Essen-on-the-Ruhr, Germany, assignors to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Mar. 27, 1905. Serial No. 252,365.



Claim.—1. A sighting and [illegible] attachment for guns comprising a plurality of eccentrically-arranged screw-spindles, a sight, means mounted independent of the screw-spindles and through which the sight is controlled, and driving means for rotating one of the screw-spindles and operating the sight-controlling means.

2. In a gun elevating and sighting attachment, means for changing the angle of elevation of the gun, means for adjusting the sight, relatively to the gun, and a driving mechanism common to both said means imparting corresponding movements thereto simultaneously in opposite directions and maintaining the sight at a substantially fixed height.

3. In a gun elevating and sighting attachment, means for changing the angle of elevation of the gun, means for adjusting the sight relatively to the gun, a driving mechanism common to both said means, and additional driving mechanism moving the gun and sight together.

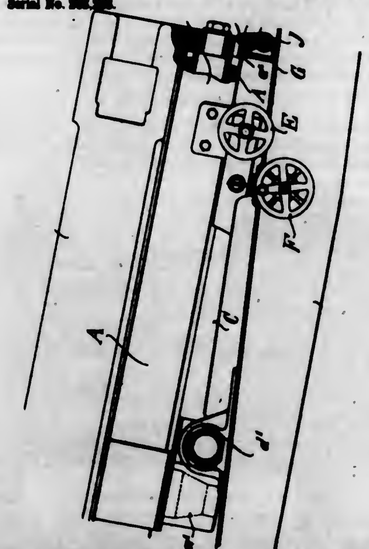
4. In a gun, the combination with the gun-barrel and the rear sight, mounted to partake in the elevation of the gun-barrel, of means operating when elevation is imparted to the gun-barrel for moving the rear sight through the same angle and in the direction opposite to the movement of the gun-barrel.

5. In a gun, the combination with the gun-barrel and the rear sight, mounted to partake in the elevation of the gun-barrel, means for elevating the gun-barrel and the rear sight, and means actuated by said elevating means for moving the rear sight through the same angle and in the opposite direction to the movement of the gun-barrel.

6. In a gun, the combination with the gun-barrel and the rear sight, mounted to partake in the elevation of the gun-barrel, means for elevating the gun-barrel and the rear sight together, and means for elevating the gun-barrel and the rear sight together and for simultaneously moving the rear sight through the same angle but in the opposite direction to the movement of the gun-barrel, causing the rear sight to remain stationary during the last-mentioned movements.

7. A sighting and elevating mechanism for guns, comprising a sight, means for controlling the same, an elevating mechanism embodying a bearing adapted to be trunnioned on the part to be elevated and a screw-spindle turning on the bearing but held against axial movement thereon; and driving mechanism for the screw having connection with the sight-controlling means to maintain the sight unchanged relatively to the target when the screw is rotated to adjust the gun.

809,819. DEVICE FOR SECURING THE GUN-BARRELS OR THE CRADLES OF PORTABLE GUNS IN THE TRAVELING POSITION. OTTO LAUBER, Essen-on-the-Ruhr, and KARL THEILE, Berbeck, near Essen-on-the-Ruhr, Germany, assignors to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed May 31, 1905. Serial No. 263,263.



Claim.—1. The combination with the mount, the part to be elevated, and elevating and horizontal training mechanisms, of means

positively securing the part to be elevated to the mount in such a manner that the parts are prevented from moving either vertically or laterally relatively to one another, and the elevating and horizontal training mechanisms are relieved of all shock.

2. The combination with the mount, the part to be elevated and elevating and horizontal training mechanisms, of a seat on the mount in which the part to be elevated is adapted to fit to hold said part against lateral movement relatively to the mount, and means for holding said part in the seat.

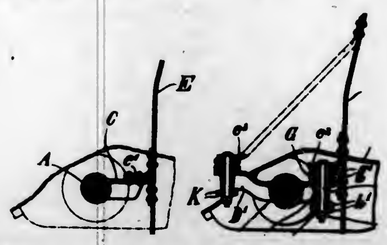
3. In a portable gun, means for securing an adjustable part of the gun in the traveling position, comprising a claw swingingly mounted on a relatively fixed part of the gun and adapted to engage said adjustable part, an axially-movable shaft on which said claw is mounted, and means carried by said shaft and locking and unlocking the claw on the axial movement of the shaft.

4. In a portable gun, means for securing the adjustable gun-barrel or cradle in the traveling position, comprising a seat in which the adjustable part is confined against lateral movement and a swinging claw adapted to lock the said part in its said seat.

5. In a portable gun, the combination with the mount and the cradle or gun-barrel vertically and horizontally adjustable thereon; of means for fixing the said adjustable member in the traveling position on the mount; said means comprising a claw journaled on the mount and adapted to engage the member to be secured, means for securing the claw in such engagement, and a channel-seat on the mount in which the member to be secured is held by the claw.

6. In a portable gun, the combination of a mount having a seat, an adjustable cradle or barrel member adapted to rest in said seat when in traveling position, means for locking the adjustable member on its seat, a shaft controlling the locking means, an arm extending from said shaft, and a pin on said arm having a seat in a relatively fixed part of the gun, to hold the shaft against turning; said shaft being axially movable to release it and permit its turning movement.

809,820. MEANS OF SECURING SHIELDS TO PORTABLE GUNS. OTTO LAUBER, Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed July 26, 1905. Serial No. 271,695.



Claim.—1. In a portable gun, the combination with the wheel-axle, of a protecting-shield having both rigid and cushioned connections with the wheel-axle.

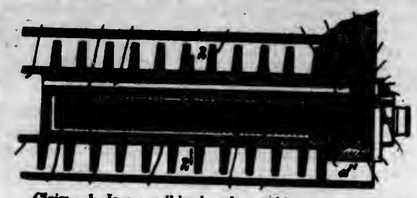
2. In a portable gun, the combination with the wheel-axle and the mount, of a protecting-shield having both rigid and cushioned connections with the axle on each side of the mount.

3. In a portable gun, the combination with the wheel-axle, of a rigid protecting-shield extending over the width of the space between the wheels, and cushioned connections between the shield and the axle absorbing vibration from the axle.

4. In a portable gun, the combination with the wheel-axle, of a protecting-shield, rearwardly-projecting arms rigidly connecting the shield to the axle, double arms projecting both forward and rearward from the axle, each having at one end cushioned connections with the shield, and braces having cushioned connection with each of said double arms, and rigid connections with the shield.

5. A portable wheeled gun-mount having a shield extending across the space between the wheels, single-arm shield-carriers projecting rearwardly from the axle near each wheel, and rigidly connected with the shield, two-armed shield-carriers projecting from the axle on either side of the body of the mount having their rear arms in cushioned connection with the shield, and upwardly-inclined braces having their lower ends in cushioned connection with the forward arms of said two-armed shield-carriers, and their upper ends in rigid connection with the shield.

809,821. RECOIL-GUN. OTTO LAUBER, Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Aug. 10, 1905. Serial No. 273,869.



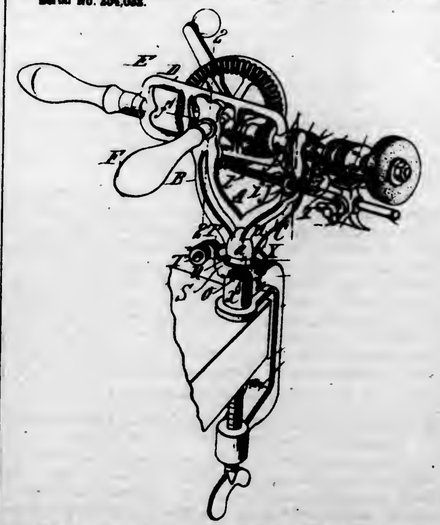
Claim.—1. In a recoil-brake, the combination with the brake-cylinder, of a housing having a chamber closed to the brake-cylinder to receive the securing-screw, and a passage leading through said housing along the side of the screw-chamber and opening into the brake-cylinder.

2. In a recoil-brake, the combination with the brake-cylinder, of a housing extending from one end thereof and having an eccentrically-positioned screw-receiving chamber closed to the brake-cylinder and a fluid-introducing passage located in the thickest portion of the housing-wall and opening into the brake-cylinder.

3. In a recoil-brake of the character described, the means for securing the brake-cylinder to the gun, the housing for said means provided with a passage leading from the exterior to the fluid-space of the brake-cylinder, and the means for holding the securing means in position, projecting into the passage in the housing.

4. In a recoil-brake of the character described, the means for securing the brake-cylinder to the gun, the housing for said means provided with a passage leading from the exterior to the fluid-space of the brake-cylinder, the means for closing said passage toward the exterior, and the means for holding the securing means in position projecting into the passage in the housing and engaging said closing means.

809,822. HOLDER FOR ROTARY TOOL-OPERATING MACHINES. CHARLES H. LAWTON, Springfield, Mass. Filed Apr. 5, 1905. Serial No. 254,032.



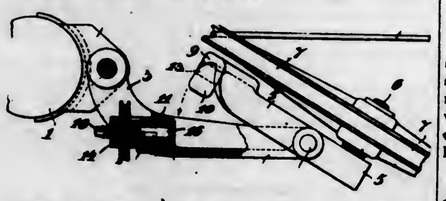
Claim.—1. In a device of the character described, a screw-clamp having formed thereon one member of a swivel-joint, a bracket-extension having a base, constituting the fellow member of said swivel-joint, a plurality of supporting and fastening devices on said bracket-extension for uniting thereto a rotary tool-operating machine, and means embodied in one of said machine supporting and fastening devices for also supporting and adjustably fastening to the said bracket-extension a tool-rest support.

2. In a device of the character described, the combination with a bracket-support comprising upwardly-divergent members, B and C,

one B thereof having an aperture *b* transversely therethrough and the other having in its side a recess *g*, and the sidewise-located cheeks constructed with the notches *i*, *i*, and tool-confining means coacting with said apertured portion of said bracket member B, of the clamp G located adjacent the recessed side of bracket-arm C, the eye-ended bolt in said recess and protruding through both said arm C and the clamp, and having the fastening-nut, and a work-rest-supporting bar, slidably engaged through the eye of said bolt, and having double rests or engagements in said notches, *i*, *i*.

3. In a device of the character described, the combination with a swivel bracket-support comprising upwardly-divergent members, B and C, one B thereof having an aperture *b* transversely therethrough and the other having the sidewise-located notches *i*, *i* and means for confining said bracket in a fixed position, of tool-confining means coacting with said apertured portion of said bracket member B, the clamp G located adjacent the side of bracket-arm C, the eye-ended bolt protruding through both said arm C and the clamp, and having the fastening-nut, and a work-rest-supporting bar L, slidably engaged through the eye of said bolt, and having double rests or engagements in said notches *i i*, and a double work-rest, reversibly carried on said bar.

809,823. **DEVICE FOR UNSHIPPING ENDLESS TRAVELING ROPES FROM THEIR PULLEYS.** GEORG LEUR, Berlin, Germany. Filed Sept. 20, 1904. Serial No. 225,260.



Claim.—1. In a device of the character described, the combination of a pulley, a rope passing over said pulley, a swinging mounting for said pulley, a swinging arm to which said mounting is jointed, means for securing said mounting and arm together, and automatically-operated mechanism for releasing said securing means to permit swinging movement of the mounting relatively to the arm.

2. In a device of the character described, the combination of a pulley, a rope passing over said pulley, a swinging mounting for said pulley, a swinging arm to which said mounting is jointed, a pin passing through perforations in said arm and said mounting for securing them together, and automatically-operated mechanism for withdrawing said pin from the mounting to allow the mounting to swing relatively to the arm.

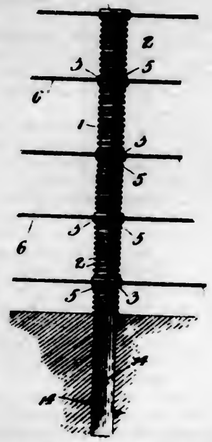
3. In a device of the character described, the combination of a pulley, a rope passing over said pulley, a swinging mounting for said pulley, a swinging arm to which said mounting is jointed, a pin passing through perforations in said arm and said mounting for securing them together, and automatically-operated mechanism for withdrawing said pin from the mounting to allow the mounting to swing relatively to the arm; said mechanism comprising a pulley fixed against axial movement and having screw-thread connection with said pin, and a rope adapted to extend to a distant point and wound upon the pulley to impart rotation thereto upon a change in the relative positions of the pulley and the distant point.

809,824. **FENCE-POST.** OTTO F. LIEBE and GEORGE REYBOUR, Ypsilanti, Mich. Filed Feb. 29, 1906. Serial No. 303,510.

Claim.—1. A fence-post having formed thereon a spiral thread, adjustable fence-wire-supporting devices adapted to engage the thread on said post whereby the same may be screwed up or down on the post, and means whereby the fence-wires are secured to said supporting devices, substantially as described.

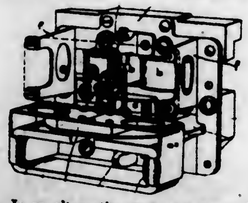
2. A fence-post having formed thereon a screw-thread running from the top to the bottom of the posts, collars having an interior thread formed thereon to engage the thread on said post whereby said collars may be shifted up and down on the post and wire-attaching hooks formed on said collars by which the line-wires of a fence may be attached thereto, substantially as described.

3. A fence-post having formed thereon a spiral thread, adjustable fence-wire-supporting devices adapted to engage the thread on said post whereby the same may be screwed up or down on the post, means whereby the fence-wires are secured to said supporting devices, and means whereby the post is firmly held in the ground, substantially as described.



4. A fence-post having formed thereon a spiral thread, adjustable fence-wire-supporting devices adapted to engage the thread on said post whereby the same may be screwed up or down on the post, means whereby the fence-wires are secured to said supporting devices, and barbs struck out of the sides of the post near the lower end of the same to form retaining devices whereby the post will be firmly held in the ground, substantially as described.

809,825. **ELECTRIC METER.** WILLIAM J. LLOYD, Pittsfield, Mass., assignor to Stanley Electric Manufacturing Company, Pittsfield, Mass., a Corporation of New Jersey. Filed May 10, 1904. Serial No. 207,944.



Claim.—1. In an alternating-current meter; a U-shaped core, potential coils carried thereby, a C-shaped core having intermediate projecting poles facing the poles of the first core and its ends extending into proximity to the poles of the first core, a current-coil carried between said projecting poles, and a conducting-disk disposed between said cores.

2. In an alternating-current meter, a U-shaped core, potential coils carried thereby, a C-shaped core forming with the first core a nearly-closed magnetic circuit and having intermediate projecting poles facing the poles of the first core, a current-coil carried between said projecting poles, and a conducting-disk disposed between said cores.

3. In an alternating-current meter, a U-shaped core, potential coils carried on the poles thereof, a current-coil carried between said poles, a C-shaped core forming with the first core a nearly-closed magnetic circuit and having intermediate projecting poles facing the poles of the first core, a second current-coil carried between said projecting poles, and a conducting-disk disposed between said cores.

4. In an alternating-current meter, a conducting-disk, means for producing a flux threading said disk, a magnetic member adapted to offer a shunt-path for said flux, and short-circuited members subjected respectively to the flux through said disk and to the flux through said shunt-path.

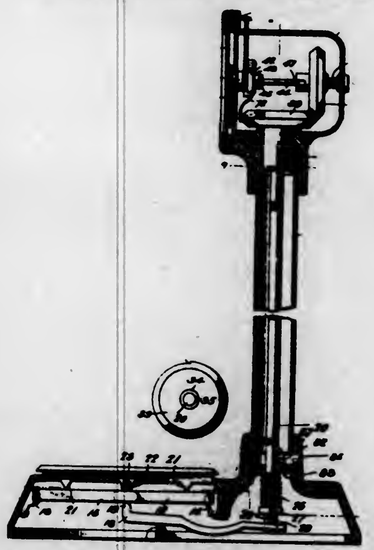
5. In an alternating-current meter, a conducting-disk, potential coils, magnetic cores arranged to direct a portion of the flux of said coils through said disk and to shunt a portion around said disk, and short-circuited members subjected respectively to the flux through said disk and to the flux shunted around said disk, said members being proportioned to produce a phase displacement of the flux through said disk of ninety degrees from the phase of the potential impressed on said coils.

6. In an alternating-current meter, a U-shaped core, potential coils carried thereby, a C-shaped core forming with the first core a nearly-closed magnetic circuit and having intermediate projecting poles facing the poles of the first core, a current-coil carried between said projecting poles, a conducting-disk disposed between said cores, short-circuited members on the ends of the U-shaped core, and short-circuited members near the ends of the C-shaped core.

7. In an alternating-current meter, a conducting-disk, means for producing a flux threading said disk, a magnetic member adapted to offer a shunt-path for said flux, and a short-circuited member subjected to the flux through said shunt-path.

8. In an alternating-current meter, a U-shaped core, potential coils carried thereby, a C-shaped core forming with the first core a nearly-closed magnetic circuit and having intermediate projecting poles facing the poles of the first core, a conducting-disk disposed between said cores, and short-circuited members carried near the ends of said C-shaped core.

809,826. **WEIGHING-SCALE.** JOHN LORENTSEN, Duluth, Minn. Original application filed Oct. 13, 1904. Serial No. 228,283. Divided and this application filed Feb. 15, 1905. Serial No. 245,757.



Claim.—1. In a weighing-scale, a platform, a shaft, an indicating means operable by the shaft, a revoluble friction-disk, means for transmitting movement from the platform to said disk, a second disk carried by said shaft, and a spring acting on said second disk and tending to force the same into engagement with the first disk.

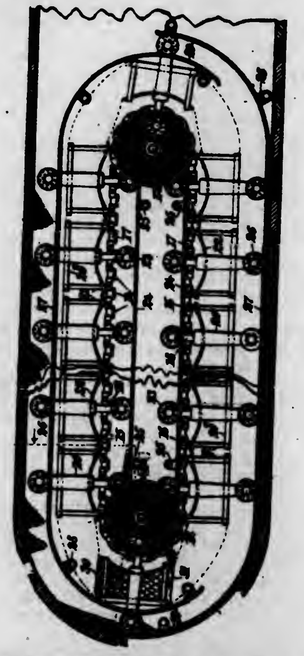
2. In a weighing-scale, a platform, an endwise-movable bar to which the platform is connected, a pin or lug projecting from the bar, a helically-grooved cam-sleeve mounted on said bar and into which said pin or lug extends, means for preventing longitudinal movement of the cam-sleeve, a friction-disk secured to the sleeve, a shaft, and a second disk carried by the shaft and engaging the first disk.

3. The combination in a weighing-scale, of a movable platform, a vertically-movable bar connected to the platform, a pin or lug projecting from the bar, a hollow sleeve encircling the bar and provided with a cam-slot into which said pin or lug extends, an internally-grooved bushing, a pin projecting from the sleeve and entering said groove, a friction-disk secured to the sleeve, a shaft, indicating mechanism, means for connecting the indicating mechanism and the shaft, and a second friction-disk carried by the shaft and engaging said first friction-disk.

4. The combination in a weighing-scale, of a base, U-shaped platform-levers pivotally supported by their cross-bars, a platform resting on the levers, a knife-edge on which the free ends of the levers are supported, a lever carrying a knife-edge, a knife-edge on which the lever is pivoted, an indicating means, and means for connecting the lever and indicating means.

5. In a weighing-scale, the combination with a base, of a pair of U-shaped platform-levers, supports on which the cross-bars of said levers are pivoted, the free ends of one lever being within the lines of the free ends of the other lever, a knife-edge on which the free ends of both levers rest, a lever carrying the knife-edge, a knife-edge on which the lever is pivoted, an indicating means, and means for connecting the lever and the indicating means.

809,827. **CONVEYER.** GEORGE LUCAS, Passaic, N. J. Filed Dec. 7, 1904. Serial No. 235,511.



Claim.—1. A conveyer comprising inner and outer tracks, carriers coacting with both tracks, and flexible material connecting and extending through the carriers.

2. In a conveyer, the combination with a series of traveling carriers, each comprising a main generally U-shaped supporting member and secondary supporting members mounted at each side thereof, of a strip of flexible material attached to and supported by the carrier members.

3. In a conveyer, the combination with a series of traveling carriers, each comprising a main generally U-shaped supporting member, secondary supporting members mounted at each side thereof and inwardly-curved bottom bars connecting the supporting members, of a strip of flexible material attached to and supported by the carrier members.

4. In a conveyer, the combination with a series of traveling carriers, each comprising a generally U-shaped member, of a strip of flexible material attached to and supported by the carrier members, rolls journaled upon the carriers, and tracks with which the rolls contact.

5. A conveyer comprising a chain consisting of links, each having a recess with oppositely-inclined walls, carriers provided with outwardly-converging arms lying within the recesses and contacting with the inclined walls, and means for securing the carriers to the links.

6. A conveyer comprising toothed wheels, a chain consisting of pivoted links operating upon the wheels and having spaces formed between adjacent links to receive the teeth, and carriers fixed to the links between their pivotal points.

809,828. REGISTERING OR INDICATING DEVICE FOR TURNSTILES. ALBERT MARSH, London, England. Filed Mar. 11, 1905. Serial No. 249,699.

Claim.—1. In a registering or indicating turnstile, the combination of hinged spring contact-arms, a disk carrying said arms, a spindle passing through said disk, bosses on said spindle situated above and below the disk, means for clutching the disk so as to be operated by said spindle in one direction of rotation and a keeper or arrester for the contact-arms.

2. In a registering or indicating turnstile, the combination with the turnstile-shaft of a spindle having a cross-pin or key therein a disk freely mounted on said spindles radial hinged spring contact-arms on said disk a boss above and a boss below the said disk, a pawl on the upper boss and teeth on the upper face of the disk for said pawl to engage, a keeper or arrester and a stop on said keeper.

3. In a registering or indicating turnstile, the combination of hinged spring contact-arms a disk carrying said arms a spindle passing through said disk, bosses on said spindle situated above and below the disk, means for clutching the disk so as to be operated by said spindle in one direction of rotation, and a contact-piece for establishing electrical connection with an electricity-generator and indicator.

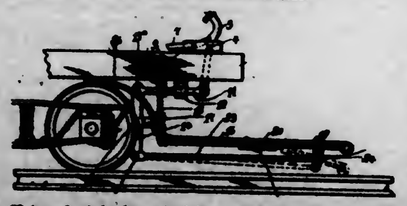
4. In a registering or indicating turnstile, the combination of hinged spring contact-arms a disk carrying said arms a spindle passing through said disk, bosses on said spindle situated above and below the disk, means for clutching the disk so as to be operated by said spindle in one direction of rotation, a spring keeper or arrester and a stop on said spring-keeper.

5. In a registering or indicating turnstile, the combination of hinged spring contact-arms a disk carrying said arms a spindle passing through said disk, bosses on said spindle situated above and below the disk, means for clutching the disk so as to be operated by said spindle in one direction of rotation and a keeper or arrester for the contact-arms, and a contact-piece for establishing electrical connection with an electricity-generator and indicator.

6. In a registering or indicating turnstile, the combination with the turnstile-shaft of a spindle having a cross-pin or key therein a disk freely mounted on said spindle radial hinged spring contact-arms on said disk a boss above and a boss below the said disk, a pawl on the upper boss and teeth on the upper face of the disk for said pawl to engage, a keeper and arrester and a stop on said keeper, a contact-piece for establishing electrical connection with an electricity-generator and indicator.

7. In a registering or indicating turnstile, the combination of hinged spring contact-arms a disk carrying said arms a spindle passing through said disk, bosses on said spindle situated above and below the disk, means for clutching the disk so as to be operated by said spindle in one direction of rotation, a spring keeper or arrester and a stop on said spring-keeper, a contact-piece for establishing electrical connection with an electricity-generator and indicator.

809,829. STREET-CAR FENDER. WILLIAM MARTIN, Wilkinsburg, Pa. Filed Sept. 1, 1905. Serial No. 276,733.

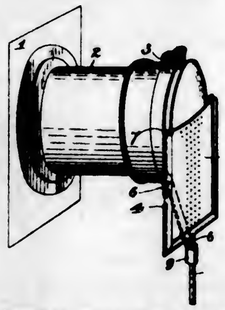


Claim.—1. A fender embodying a stationary section supported beneath the floor of the car, and a section hinged thereto, a lever fulcrumed in bearings secured to the floor of the car, means operatively connecting said lever with said hinged section, whereby to impart movement to the latter when said lever is moved, means to hold said lever normally against movement, means for positively imparting movement to said lever when released by said holding means.

2. A fender embodying a stationary section, a section hinged thereto, a lever fulcrumed in bearings secured to the floor of the car, means operatively connected to said hinged section and to said lever, spring-held means for holding said lever, and adapted to be released from engagement therewith, means for imparting movement to said lever when released by said holding means.

3. A fender embodying a stationary section, supported by the floor of a car, and a section hinged to said stationary section, a lever fulcrumed in bearings secured to the car, means operatively connecting said lever with said hinged section whereby to vary the movement of the same with the movement of said lever, means to lock said lever against movement, means for imparting movement to said lever when released by said locking means, said lever being adapted to be moved by the foot, and thereby restored to initial position, and means for returning said locking means into positive engagement with said lever when the latter has been restored to initial position.

809,830. SCREEN FOR PHOTOGRAPHIC CAMERA-LENSES. HENRY S. MILLER, Fond du Lac, Wis. Filed May 6, 1904. Serial No. 206,753.



Claim.—1. A foraminous screen effective for the full exposure of the lenses or their exposure to a modified degree for the purpose set forth.

2. The combination with a photographic camera-lens of a screen having an opaque surface or area and provided with numerous perforations produced directly therein in pyramidal form or outline, in the line of the lens.

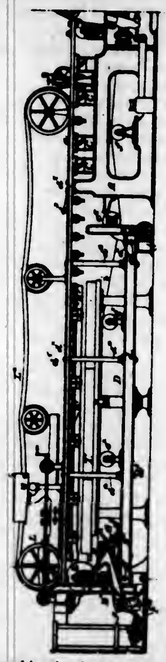
809,831. TELEPHONE-TRANSMITTER. JOHN S. MILLER, Erie, Pa. Filed Oct. 19, 1904. Serial No. 229,171.

Claim.—1. In a telephone-transmitter, the combination of a non-vibrating back plate; a washer of fibrous and non-conducting material forming a container; and dampener mounted on the back plate; an electrode arranged within the washer, the electrode being of less thickness than the washer; granulated conducting material in the cavity with the electrode; a ring of conducting material arranged outside of said washer and mounted within the case but insulated from the case and back plate; and a diaphragm mounted on said ring and in electric contact with said ring and being connected with the back plate through the electrode and material in the cavity and the washer.

2. In a telephone-transmitter, the combination of the case A having a cavity therein for containing the transmitting parts; a non-vibrating back plate secured to the case and closing said cavity; a fibrous washer mounted on the back plate; transmitting material arranged in the washer; the diaphragm H arranged over the washer and in contact with the transmitting material; the ring H' on which the diaphragm is arranged; the packing-rings h and h' for sealing the space between the diaphragm and the back plate, and for insulating the diaphragm from the back plate and case; the terminal J; and means for connecting said terminal with the diaphragm.

3. In a telephone-transmitter, the combination of the case A having a cavity therein for containing the transmitting parts; a non-vibrating back plate secured to the case and closing said cavity; a fibrous washer mounted on the back plate; transmitting material arranged in the washer; the diaphragm H arranged over the washer and in contact with the transmitting material; the ring H' on which the diaphragm is arranged; the packing-rings h and h' for sealing the space between the diaphragm and the back plate, and for insulating the diaphragm from the back plate and case; the terminal J; means for connecting said terminal with the diaphragm; and the shell K secured to the back of the case and inclosing the plate.

809,832. PAPER-MAKING MACHINE. JOHN W. MOORE and JOSEPH A. WHITE, Philadelphia, Pa. Filed Mar. 15, 1899. Serial No. 709,173.



Claim.—1. The combination in a paper-making machine, of a shake-frame having flexible side frames connected to each other, each of said frames consisting of upper and lower members, with means rigidly connecting the same whereby the upper member is carried by the lower member, standards having secured to them flexible suspension-plates attached to one end of the shake-frame, and a fixed member to which the lower members of the shake-frame are rigidly attached, with means for vibrating the shake-frame, substantially as described.

2. The combination in a paper-making machine, of a fixed frame, a fixed standard, a shake-frame consisting of upper and lower side members and an end frame, means for securing the members of the shake-frame rigidly together, a rigid connection between the lower side rails and the fixed standard, and a rigid connection between the upper side rails and the fixed frame, means for supporting the free end of the shake-frame, and means for vibrating said end, substantially as described.

3. The combination of the shake-frame of a paper-making machine, consisting of upper and lower rails connected together, an end frame secured to the ends of the said rails, the lower rails being each made of two channel-bars, with a space between them, columns extending from the lower to the upper rails, tie-bolts extending through the upper rails and the columns and through the space between the channel-bars of the lower rails and means for supporting the said shake-frame, substantially as described.

4. The combination in a paper-making machine, of a shake-frame having upper and lower rails, the lower rails made up of two spaced members, a standard, a flexible plate suspended from said standard and passing through the space between the members of the lower rails, and a bracket carried by the lower rails to which said flexible plate is clamped, substantially as described.

5. The combination in a paper-making machine, of a shake-frame having upper and lower rails, the lower rails each consisting of two members spaced, a bracket secured to each lower rail, a standard, a bolt adjustable in said standard, a flexible suspension-plate hung from said bolt and secured to the bracket on the lower rails of the shake-frame, a clamp-block between which and an extension of the standard the flexible plate is clamped, a portion of the clamp-block extending over the standard, and a set-screw by which the clamp-block, bolt, and flexible plate can be raised to adjust the shake-frame, substantially as described.

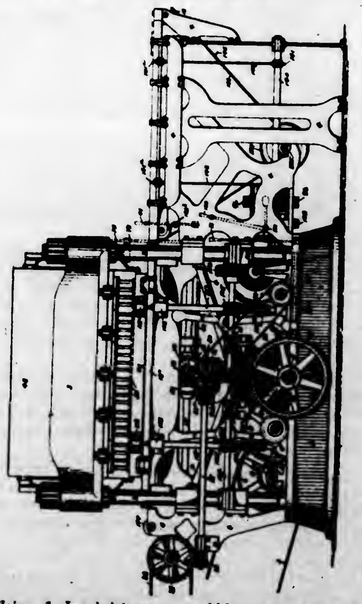
809,833. APPARATUS FOR THE PRODUCTION OF GLOBOIDAL WORM-WHEELS. GUSTAV MOTZKE, Rottenhofstedt, near Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp, Essen-on-the-Ruhr, Germany. Filed Sept. 3, 1901. Serial No. 74,141.

Claim.—1. The combination of a rotatable tool-carrier provided with a lateral and an arcuate recess, a bit-holder, means securing the bit-holder in the arcuate recess and to the tool-carrier and radially-adjustable cutters disposed radially in an arc on the bit-holder and controllable for adjustment by way of the lateral recess.

2. In a rotary tool for constructing globoidal worm-wheels, a plurality of cutting-bits arranged and shiftable in an arc concentric with the circumference of the wheel to be cut.

3. The combination with the tool-carrier, of a plurality of radially-positioned cutting-bits forming and shiftable in an arc.

809,834. CEMENT-BRICK PRESS. HORACE B. MURDOCK, Detroit, Mich. Filed Feb. 21, 1905. Serial No. 246,730.



Claim.—1. In a brick-press, a mold-box, means for loosely filling said box with brick-making material, means for tamping said loose material, means for refilling said box, and means for pressing the fresh and tamped material into a finished brick, substantially as described.

2. In a brick-press, a mold-box, means for loosely filling said box with brick-making material, means for tamping said loose material, means for refilling said box, means for pressing the fresh and tamped material into a finished brick, and means for displacing said brick from beneath said pressing means, substantially as described.

3. In a brick-press, a mold-box, means for loosely filling said

box with brick-making material, means for tamping said loose material, means for refilling said box, means for pressing the fresh and tamped material into a finished brick, and automatic means for displacing said brick from beneath said pressing means, substantially as described.

4. In a brick-press, a mold-box, means for tamping the material therein, means for removing said box from beneath the tamper, means for pressing the material after such removal, means for stripping said mold from the brick after being pressed and means for removing the pressed brick from the machine, substantially as described.

5. In a brick-press, a mold-box, a stationary and a movable table, a tamping mechanism above the former and a pressing-punch above the latter, and means for mechanically moving said box from one table to the other, substantially as described.

6. In a brick-press, a mold-box, a stationary and a movable table, a tamping mechanism above the former and a pressing-punch above the latter, means for moving said box from one table to the other, and means for filling said box with material during its passage, substantially as described.

7. In a brick-press, an open-ended feed-chute, a mold-box, a stationary tamping-table, a movable pressing-table, means for moving said box from one table to the other under said chute, and means for closing said chutes, during the period of said operations, substantially as described.

8. In a brick-press, a reciprocating tamp, a stationary table thereunder, a stationary pressing-punch, a reciprocating table thereunder, a feed-chute between said tables, a mold-box, and means for moving said box from one table to the other and under said chute, substantially as described.

9. In a brick-press, a mold-box, means for tamping the material therein, means for mechanically moving said box onto a pressing-table, means for moving said pressing-table against a pressing-punch, and means for stopping its movement when said table is in its highest position, substantially as described.

10. In a brick-press, a pressing-punch and a reciprocating table thereunder, means for placing a filled mold-box on said table, while at a low level, automatic means for stopping the movement of said table at its highest level, when said box is in contact with said punch, and also when slightly withdrawn, and means for stripping the mold-box from the brick while said table is in the latter-named position, substantially as described.

11. In a brick-press, a brick-material feeder and a mold-box, means for moving said box past said feeder to loosely fill the same, means for tamping said loose material, means for moving said box back past said feeder to refill the same, and means for pressing said fresh and tamped material into a finished brick, substantially as described.

12. In a brick-press, a brick-material feeder and a mold-box means for moving said box past said feeder to loosely fill the same, means for tamping said loose material, means for moving said box back past said feeder to refill the same, means for pressing said fresh and tamped material into a finished brick, and automatic means for removing said brick from operative position, substantially as described.

13. In a brick-press, a feed-chute and a mold-box, a pressing and a tamping mechanism, means for moving said box from one of said mechanisms to the other and back again beneath said chute, and means for removing said tamped and pressed brick from operative position, substantially as described.

14. In a brick-press, a feed-chute, a mold-box and palette therefor, means for moving said box and palette beneath said chute, thereby loosely filling the same, to a tamping mechanism, means for operating said tamping mechanism, means for again passing said box and palette beneath said chute, thereby refilling the same, to a pressing mechanism, means for operating said pressing mechanism, and means for removing said tamped and pressed brick from operative position by the motion of a new incoming palette, substantially as described.

15. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, and means controlled by said actuating means for bringing forward a new palette when the brick is finished, substantially as described.

16. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, and means for bringing forward a new palette when the brick is finished, substantially as described.

17. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, and automatic means controlled by said actuating means for bringing forward a new palette when the brick is finished, substantially as described.

18. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, and means controlled by said actuating means for bringing forward a new palette when the brick is finished, and for placing a second new palette in proper position to be brought forward at the proper time, substantially as described.

19. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, and automatic means controlled by said actuating means for bringing forward a new palette when the brick is finished, and for placing a second new palette in proper position to be brought forward at the proper time, substantially as described.

20. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, means for bringing forward a new palette, and means for placing the mold-box thereon ready to be refilled, substantially as described.

21. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, means for bringing forward a new palette, and means controlled by the means for bringing forward the new palette for placing the mold-box thereon ready to be refilled, substantially as described.

22. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, means controlled by said actuating means for bringing forward a new palette and for placing the mold-box thereon ready to be refilled, substantially as described.

23. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, and means controlled by said actuating means for bringing forward a new palette, for placing the mold-box thereon, and for placing a second new palette in proper position to be brought forward at the proper time, substantially as described.

24. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, a carrier for bringing forward a new palette, and means for returning said carrier to its normal position, substantially as described.

25. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, a carrier for bringing forward a new palette, and means controlled by the movement of said carrier for returning the same to its normal position, substantially as described.

26. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, a carrier controlled by said actuating means for bringing forward a new palette, and means controlled by the movement of said carrier for returning the same to its normal position, substantially as described.

27. In a brick-press, a pressing-punch and a table thereunder, means for placing a filled mold-box with its palette on said table, means for bringing said table and punch together to press the brick, means for stripping the box from the finished brick, and means controlled by said actuating means for bringing forward a new palette, for placing the mold-box thereon, for returning the means for bringing forward the new palette to its normal position, and for placing a second new palette in proper position to be brought forward at the proper time, substantially as described.

28. In a brick-press, means for placing a palette and mold-box therefor in the machine, means for filling the box, means for moving the palette and box under a tamp, means for operating the tamp, means for again filling said box, means for moving the box and palette beneath a punch, means for pressing the material with said punch, means for stripping the pressed brick of its mold-box and means for removing the palette and finished brick from the machine, substantially as described.

29. In a brick-press, means for feeding a palette in the machine, means for placing a mold-box on said palette, a feed-chute, means for moving said palette and box under said chute and beneath a tamp, means for operating said tamp on the material fed into said box, means for moving said palette and box back under said chute and beneath a punch, means for closing said feed-chute after the passage of said box, means for pressing the material in said box with said punch, means for stripping the pressed brick of its mold-box, and means for removing the palette and finished brick from the machine, substantially as described.

30. In a machine of the class designated, a tamping mechanism comprising a cam, a reciprocating tamp controlled thereby, means for revolving said cam, a rock-shaft, a dog on said shaft, means on said tamp with which said dog engages to lock the former against movement, a similar locking means for said cam, means for rocking said shaft to disengage said dogs, and means for actuating said revolving means, substantially as described.

31. In a machine of the class designated, a tamping mechanism comprising a cam, a reciprocating tamp controlled thereby, means for revolving said cam, means for locking said cam and tamp against movement, means for releasing said locking means, and means controlled by said releasing means for actuating said revolving means, substantially as described.

32. In a brick-press, a feed-chute, a mold-box, means for moving said box past said chute to fill the same, and means for closing said chute after the passage of said box comprising, a movable gate, a spring-hook attached to said gate, means on said mold-box for engaging said hook, and means for exerting a pressure on said hook to disengage the same when said gate has been moved in position beneath said chute, substantially as described.

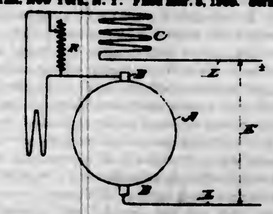
33. In a brick-press, a feed-chute, a mold-box, means for moving said box past said chute to fill the same, and means for closing said chute after the passage of said box comprising, a movable gate, a spring-hook attached to said gate, means on said mold-box for engaging said hook, a rod having one end in contact with said hook and its other attached to one end of a lever pivoted to said gate, and means for actuating the other end of said lever when the gate has been moved in position beneath the chute, whereby said rod exerts a pressure on said hook and releases the same, substantially as described.

34. In a brick-press, a mold-box and means for stripping said box from the finished brick comprising a vertically-movable stripper-hook, a lug on said box, and means for bringing said hook into engagement with said lug during its movement, substantially as described.

35. In a brick-press, a mold-box and means for stripping said box from the finished brick comprising a vertically-movable stripper-hook, a lug on said box, means for bringing said hook into engagement with said lug during its movement, and means for locking said members in such engagement, substantially as described.

36. In a brick-press, a mold-box and means for stripping said box from the finished brick comprising a vertically-movable bar, a member pivoted therein having a hook at one end and an extended tailpiece at the other, a lug on said box, and a guide through which said member passes adapted to press upon said tailpiece and bring and lock said hooked end and lug in engagement, substantially as described.

809,885. ALTERNATING-CURRENT MACHINERY. ADDAMS S. MCALLISTER, New York, N. Y. Filed Mar. 8, 1905. Serial No. 249,697.



Claim.—1. The combination of an alternating-current machine, having a rotor provided with a commutator means for nullifying the rotor magnetism, and means for maintaining a predetermined power factor at different speeds.

2. The combination of an alternating-current machine, having a rotor provided with a commutator, a field-winding, a compensating winding adapted to nullify the rotor magnetism, and means for controlling the power factor of said machine at different speeds.

3. The combination of an alternating-current machine, having a rotor provided with a commutator, a field-winding, a compensating winding adapted to nullify the rotor magnetism, and adjustable means for causing said machine to take current either in phase or leading with respect to the line electromotive force.

4. The combination of an alternating-current machine, having a rotor provided with a commutator, a stator provided with field and compensating windings, and means connected with a stator-winding for maintaining a predetermined power factor at different speeds.

5. The combination of an alternating-current machine, having a rotor provided with a commutator, a field-winding, and a compensating winding adapted to nullify the rotor magnetism, and a non-inductive resistance in shunt to said field-winding, and adapted to maintain the power factor at unity.

6. The combination of an alternating-current machine, having a rotor provided with a commutator, a field-winding, and a compensating winding adapted to nullify the rotor magnetism, and an adjustable non-inductive resistance in shunt to said field-winding, and adapted to maintain the power factor at unity.

7. The combination of an alternating-current machine having a rotor provided with a commutator, a field-winding, and a non-inductive resistance in shunt to said field-winding, and adapted to improve the power factor.

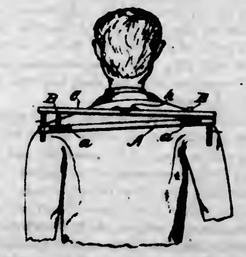
8. The combination of an alternating-current machine having a rotor provided with a commutator, a field-winding, and an adjustable non-inductive resistance in shunt to said field-winding, and adapted to improve the power factor.

9. The combination of an alternating-current machine having field and armature members connected in series, and means for superposing a current in the armature-circuit in quadrature to the working current.

10. The combination of an alternating-current machine having field and armature members connected in series, and means for superposing a current in the armature-circuit in leading quadrature to the working current.

11. The combination of an alternating-current machine having field and armature members connected in series, a compensating winding adapted to nullify the rotor magnetism, and means for superposing a current in the armature-circuit in quadrature to the working current.

809,886. TAILOR'S MEASURE. FRED NORDSTROM, New York, N. Y. Filed Aug. 21, 1905. Serial No. 275,116.



Claim.—1. The herein-described tailor's measure, the same being composed of separate bars, shoulder-pieces applied upon one bar and scales or measures and a level applied upon the other bar, the parts being combined and arranged for operation, substantially as set forth.

2. In a measure of the character herein set forth, the combination with the lower bar of the adjustable shoulder-pieces mounted in connection therewith, said bar being slotted to receive gages or measures, substantially as and for the purposes set forth.

3. In a measure of the character herein set forth, the combination with the lower bar of adjustable shoulder-pieces, said shoulder-pieces being each provided with a tang passing through the said bar, and sliding pieces connected with the tangs, substantially as shown.

4. In a measure of the character herein set forth, the combination with the lower bar having adjustable shoulder-pieces applied thereon, of an upper bar having a fixed scale or measure at each end

gage the contact-piece of a cut-out, the opposite end of said fuse-plug being open, a cartridge-fuse removable from said open end, and

teeth, an inner sleeve slidable upon said stock and provided with transverse apertures, pawls operating through said apertures for engagement with said ratchet-teeth, an outer sleeve rotative upon

---

809,889. STRAM-GENERATOR. JOHN W. PAYNE, Alexandria Bay, N. Y., assignor of one-third to Gorham Lyle Olds, Alexandria Bay, N. Y. Filed July 29, 1903. Serial No. 167,322.

4. In a measure of the character herein set forth, the combination with the lower bar having adjustable shoulder-pieces applied thereon, of an upper bar having a fixed gage or measure at each end and having a spirit-level, the parts being arranged and combined substantially as shown.

5. In a measure of the character herein set forth, the combination of two bars curved as explained, the shoulder-pieces adjustably mounted on one of the bars, and the gage or scales mounted on the other bar and arranged to pass through slots in the first bar, substantially as shown and described.

809,887. **FUSE-PLUG.** HENRY T. PARRY, Philadelphia, Pa. Filed Nov. 23, 1904. Serial No. 234,659.

Claim.—1. The combination in a fuse-plug of a metallic shell and a plate at one end of the same, together forming the terminals of the plug, spring-clips respectively in permanent electrical connection with said terminals, and a cartridge-fuse having terminals placed to be engaged by said clips, substantially as described.

2. The combination in a fuse-plug of a metallic shell having at one end a metallic plate, respectively forming with said shell the terminals of the plug, a cartridge-fuse, and clips for said fuse respectively in electrical connection with said plug-terminals, a clip or clips extending beyond the end of the shell, substantially as described.

3. In a fuse-plug the combination of a fuse-carrier, a metallic shell of less length than said carrier, a clip or clips connected to the shell and projecting beyond the same for engaging one terminal of the fuse-carrier, a terminal plate, and a second clip connected thereto for engaging the second terminal of the fuse-carrier, substantially as described.

4. In a fuse-plug the combination of a metallic shell having an insulating-lining and a piece of insulating material permanently closing one of its ends, a plate carried by said closing-piece having connected to it a spring-clip, with a second spring-clip permanently connected to the shell, both of said clips being constructed to have the circuit between them completed through a fuse, substantially as described.

5. The combination in a fuse-plug of a metallic shell and a plate respectively forming the terminals of the plug, two clips respectively connected to said terminals, one of said clips being within the shell and the other outside of the same, with a removable cover fitting on the end of the shell having the outer clip, substantially as described.

6. The combination in a fuse-plug of a threaded shell having a cover of insulating material screwed over one end, a terminal piece at the other end of said plug and spring-clips respectively in permanent electrical connection with the shell and with the terminal piece, substantially as described.

7. The combination of a metallic shell, an end piece therefor of insulating material, a terminal piece carried by said end piece, a metallic clip or clips within the shell in connection with the terminal piece, a second clip or clips connected to the shell and extending beyond the end of the same, and a fuse having terminal pieces shaped to electrically connect with said two clips, substantially as described.

8. The combination of a metallic shell, an end piece of insulating material therefor, a terminal piece carried by said end piece, a metallic clip or clips within the shell in connection with the terminal piece, a second clip or clips connected to the shell and extending beyond the end of the same, and a fuse having terminal pieces shaped to electrically connect with said two clips, the end of the shell having the projecting clip or clips being provided with a removable cover, substantially as described.

9. The combination in a fuse-plug of a shell, an insulating-lining therefor, a spring-clip, a device for electrically connecting said clip and shell, said device also holding said lining in position, a terminal plate insulated from the shell, and a spring-clip connected to said plate, said two clips being shaped to receive a cartridge-fuse, substantially as described.

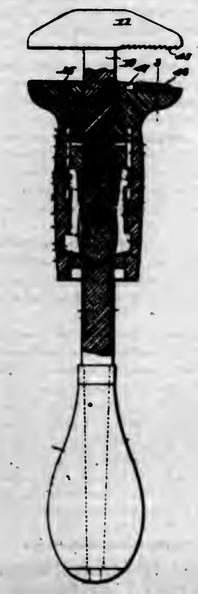
10. In a fuse-plug, the combination of a casing having terminals including a terminal plate at one end of said casing adapted to engage the contact-piece of a cut-out, the opposite end of said fuse-plug being open, a cartridge-fuse removable from said open end, and means permanently carried by the casing for forming electrical connection between the terminals of said cartridge-fuse and the terminals of the plug, substantially as described.

11. In a fuse-plug, a metallic shell having an insulated terminal plate at one end adapted to engage a contact-piece in a cut-out, the opposite end of said fuse-plug being open, a cartridge-fuse removable from said open end, and means for forming electrical connection between the terminals of said cartridge-fuse and the shell and terminal plate respectively, with a removable cover independent of said connecting means for closing the open end of said shell, the electrical circuit of the plug being independent of said cover, substantially as described.

12. The combination in a fuse-plug of a supporting-body, a metallic shell and a terminal piece on said body, a cartridge-fuse, and means electrically connected to the shell and to the terminal piece for respectively forming electrical connection with the terminals of the fuse, the fuse having an indicator-opening in a portion of its body beyond the end of the plug when said fuse is in position in the plug, substantially as described.

13. The combination in a fuse-plug of a metallic shell and a terminal piece adapted for engagement with the terminals of a cut-out, a cartridge-fuse, and terminal clips respectively connected to the shell and to the said terminal piece, said clips being constructed to be electrically connected by the cartridge-fuse, said fuse projecting beyond one end of the metallic shell so that its indicator-opening is visible while the fuse is in such position as to complete the circuit between the terminals of the plug, substantially as described.

809,888. **WRENCH.** ARTHUR W. PARFITT, New London, Wis., assignor of one-half to Albert G. Westphal, Hortonia, Wis. Filed Aug. 11, 1905. Serial No. 273,777.



Claim.—1. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls associated with said inner sleeve for engaging said transverse teeth, an outer sleeve rotative upon said inner sleeve, a movable jaw slidable upon said stock and having said outer sleeve coupled rotatively thereto, and means whereby said pawls are caused to engage said ratchet-teeth and lock said sleeves and movable jaw to said stock when said outer sleeve is disposed in one position and released therefrom when said outer sleeve is disposed in another position.

2. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engaging said teeth and provided with outwardly-extending lugs at the ends, an outer sleeve rotative upon said inner sleeve and provided with spaced apertures inclined at one side for receiving the lugs at one end of said pawls and with annular channels decreasing in depth at one end for receiving the lugs at the other end of the pawls and decreasing in depth toward one end and inclined to the transverse plane of the stock, a movable jaw slidable upon said stock and having said sleeve coupled rotatively thereto, whereby when said outer sleeve is rotated in one direction said pawls will be depressed at one end for engagement with said teeth and said movable jaw forcibly adjusted longitudinally of the stock and released therefrom when the outer sleeve is rotated in the other direction.

teeth, an inner sleeve slidable upon said stock and provided with transverse apertures, pawls operating through said apertures for engagement with said ratchet-teeth, an outer sleeve rotative upon said inner sleeve, a movable jaw slidable upon said stock and having said outer sleeve coupled rotatively thereto, and means whereby said pawls will be caused to engage said ratchet-teeth and lock said movable jaw to said stock when said outer sleeve is disposed in one position and disconnected therefrom when the outer sleeve is disposed in another position.

3. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engaging said teeth and provided with outwardly-extending lugs at the ends, an outer sleeve rotative upon said inner sleeve and provided with spaced apertures inclined at one side for receiving the lugs at one end of said pawls and with annular channels decreasing in depth at one end for receiving the lugs at the other end of said pawls, a movable jaw slidable upon said stock and having said outer sleeve coupled rotatively thereto, whereby when said outer sleeve is rotated in one direction said pawls will be depressed at one end for engagement with said teeth and released therefrom when the outer sleeve is rotated in the other direction.

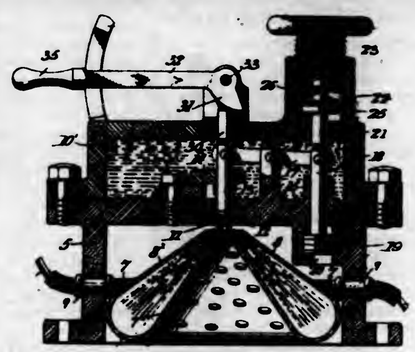
4. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engaging said teeth and provided with outwardly-extending lugs at the ends, an outer sleeve rotative upon said inner sleeve and provided with spaced apertures inclined at one side for receiving the lugs at one end of said pawls and with annular channels decreasing in depth at one end for receiving the lugs at the other end of the pawls and decreasing in depth toward one end and inclined to the transverse plane of the stock, a movable jaw slidable upon said stock and having said sleeve coupled rotatively thereto, whereby when said outer sleeve is rotated in one direction said pawls will be depressed at one end for engagement with said teeth and said movable jaw forcibly adjusted longitudinally of the stock and released therefrom when the outer sleeve is rotated in the other direction.

5. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engagingsaid teeth, an outer sleeve rotative upon said inner sleeve and provided with an internal annular channel, a movable jaw slidable upon said stock and provided with a rib for engaging said channel whereby said outer sleeve and movable jaw are rotatively coupled, and means whereby said pawls are caused to engage said teeth and lock said sleeve and movable jaw to said stock when said outer sleeve is disposed in one position and released therefrom when the outer sleeve is disposed in another position.

6. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engaging said teeth and provided with outwardly-extending lugs at the ends, an outer sleeve rotative upon said inner sleeve and provided with spaced apertures inclined at one side for receiving the lugs at one end of said pawls and with annular channels decreasing in depth at one end for receiving the lugs at the other end of said pawls, and with longitudinal channels leading from said annular channels through one end of the outer sleeve, a movable jaw slidable upon said stock and having said outer sleeve coupled rotatively thereto, whereby when said outer sleeve is rotated in one direction said pawls will be depressed at one end for engagement with said teeth and released therefrom when the outer sleeve is rotated in the other direction.

7. In a wrench, a stock having a stationary jaw at one end and a handle at the other end and provided with spaced transverse teeth, an inner sleeve slidable upon said stock, pawls operating through said inner sleeve for engaging said teeth and provided with outwardly extending lugs at the ends, an outer sleeve rotative upon said inner sleeve and provided with spaced apertures inclined at one side for receiving the lugs at one end of said pawls and with annular channels decreasing in depth at one end for receiving the lugs at the other end of said pawls, and with stop-pins extending in the paths of said lugs to limit the movement in one direction, a movable jaw slidable upon said stock and having said outer sleeve coupled rotatively thereto, whereby when said outer sleeve is rotated in one direction said pawls will be depressed at one end for engagement with said teeth and released therefrom when the outer sleeve is rotated in the other direction.

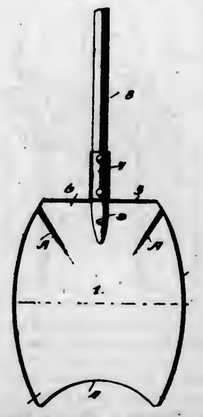
809,889. **STEAM-GENERATOR.** JOHN W. PAYNE, Alexandria Bay, N. Y., assignor of one-third to Gorham Lyle Olds, Alexandria Bay, N. Y. Filed July 20, 1903. Serial No. 166,382.



Claim.—1. In a steam-generator, a flasher, comprising a substantially conical bowl having inner and outer conical walls, the lower ends of which are connected, the distance between said walls gradually decreasing toward the contracted open top of the bowl, said walls being provided with perforations, and means for spraying water into the bowl.

2. In a device of the class specified, a steam-chamber, a flasher therein, a water-chamber having a ported communication with the steam-chamber, a valve for the port, a plunger exposed to the steam-pressure, means connecting the valve and plunger, means for regulating operative movement of the plunger, a throttle-lever, and a cam carried by the throttle-lever and adapted to close the valve to stop the flow of water to the steam-chamber.

809,840. **SHOVEL.** FREDERICK S. C. PERKINS, San Saba, Tex. Filed Sept. 9, 1905. Serial No. 277,743.



Claim.—A shovel comprising a dished blade of greater length than width and of maximum width and dish along its central transverse line, the forward edge of the blade being formed with an arcuate concavity and the side edges of the blade being beveled to form cutting edges which converge from the center toward the front and rear edges of the blade, the upper or rear end of the blade having an oblique truncate triangular portion, a socket carried by said triangular portion, and a handle applied to the socket.

809,841. **EXPLOSION-ENGINE.** GUSTAV PETERS, Tegel, Germany. Filed Apr. 18, 1904. Serial No. 203,673.

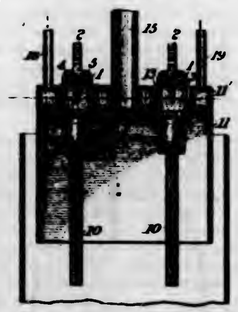
Claim.—The combination of the oppositely-moving pistons, a cylinder in which the oppositely-moving pistons work, having a working chamber at each end thereof, a working chamber between

and common to both the pistons and exhausts, each common to one

passage to give a high current density in the electrodes and effect the

and common to both the pistons and exhausts, each common to one end working chamber and the middle working chamber and controlled by a piston, means simultaneously admitting an explosive mixture into the end working chambers, and means for admitting an explosive mixture between the pistons.

809,842. APPARATUS FOR THE PRODUCTION OF CALCIUM CARBID. EDGAR F. PRICE, GEORGE B. COX, and JAMES G. MARSHALL, Niagara Falls, N. Y., assignors to Union Carbide Company, Niagara Falls, N. Y., a Corporation of Virginia. Filed Oct. 19, 1904. Serial No. 228,169.



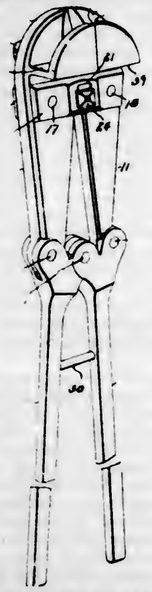
Claim.—1. In an electric furnace for the production of calcium carbid, and in combination with a feed-supply of lime and carbon, electrodes consisting of graphite rods of reduced cross-section, means for supplying to the electrodes an electric current of sufficient amperage to give a high current density in the electrodes and effect the reduction of the charge, means for substantially excluding oxidizing gases within the charge from the sides of said rods and means for withdrawing heat from the ends of the electrodes remote from the zone of reduction, as set forth.

2. In an electric furnace for the production of calcium carbid, and in combination with a feed-supply of lime and carbon, electrodes each consisting of spaced graphite rods, means for supplying to the electrodes an electric current of sufficient amperage to give a high current density in the electrodes and effect the reduction of the charge, a jacket surrounding the electrode-rods for excluding gases therefrom, and means for withdrawing heat from the ends of the electrodes remote from the zone of reduction, as set forth.

3. In an electric furnace for the production of calcium carbid, and in combination with a feed-supply of lime and carbon, electrodes consisting of graphite rods of reduced cross-section, means for supplying to the electrodes an electric current of sufficient amperage to give a high current density in the electrodes and effect the reduction of the charge, means for substantially excluding oxidizing gases from the sides of the rods and for supporting them against breakage, and means for withdrawing heat from the ends of the electrodes remote from the zone of reduction, as set forth.

4. In an electric furnace for the production of calcium carbid, and in combination with a feed-supply of lime and carbon, electrodes consisting of graphite rods of reduced cross-section, means for supplying to the electrodes an electric current of sufficient amperage to give a high current density in the electrodes and effect the reduction of the charge, a reinforcing and protecting body of relatively high resistance surrounding said rods, and means for withdrawing heat from the ends of the electrodes remote from the zone of reduction, as set forth.

809,843. BOLT-CLIPPER. JOHN PULVITT, Alvarado, Tex. Filed Sept. 22, 1905. Serial No. 279,705.



Claim.—In an implement of the class described, two reversely-disposed jaw members having wings extending laterally therefrom and terminating in projections extending parallel to the side faces of the jaws the adjacent faces of said projections having cutting edges, said jaw members having overlapping ears extending intermediately therefrom and united by a pivot having extended ends, side plates pivoted to said jaw members and having slots bearing over the extended ends of said pivot and means for actuating the jaw members.

809,844. BALING-PRESS. JOHN W. REYNOLDS, Erin, Tenn. Filed Aug. 24, 1905. Serial No. 275,202.

Claim.—1. An apparatus of the class described, comprising in combination with a baling-press having a laterally-movable reciprocating plunger, of an S-shaped cam for coöperating with said plunger to reciprocate the same, and means for releasing said plunger from said cam at times.

2. An apparatus of the class described, comprising the combination with a baling-press having a laterally-movable reciprocating plunger, of a double-cam member, means for rotating said cam member, said plunger and cam being coöperatively arranged, means for releasing said plunger from said cam member at times, substantially as shown and described.

3. An apparatus of the class described, comprising in combination with a press having a laterally-movable reciprocating plunger, of a shaft mounted in a plane at right angles to the plane of reciprocation of the plunger, a double-cam member secured to said shaft, means for rotating said shaft, said cam member and said plunger being coöperatively connected, means for holding said plunger in engagement with said cam, and means for releasing said plunger from said cam at times, substantially as shown and described.

4. An apparatus of the class described, comprising the combination with a laterally-movable reciprocating member, of a power mechanism for reciprocating said member and comprising an S-shaped cam member having double-cam portions, said double-cam portions being separated at the center of the S-shaped member to leave a passage-way, means for rotating said cam member and means for forcing the reciprocating member through said cam passage-way when in alinement therewith, substantially as shown and described.

5. An apparatus of the class described, comprising the combination with a baling-press having a laterally-movable reciprocating plunger, an S-shaped cam member, means for rotating said S-shaped cam member to engage said reciprocating plunger to reciprocate the same in one direction, spring devices for reciprocating the plunger in the opposite direction, said cam member having means for permitting the plunger to be disengaged therefrom at times, substantially as shown and described.

6. An apparatus of the class described, the combination with a baling-press having a laterally-movable reciprocating plunger, an S-shaped cam member, means for rotating said S-shaped cam member to engage said reciprocating plunger to reciprocate the same in one direction, spring devices for reciprocating the plunger in the opposite direction, said cam member having a passage midway its ends to permit the plunger becoming released from the cam as it comes in alinement with said passage substantially as shown and described.

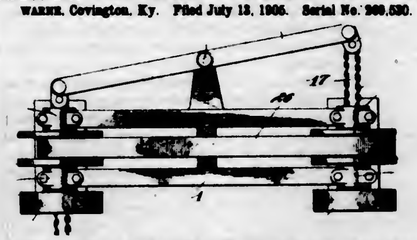
7. An apparatus of the class described, comprising in combination with a press having a laterally-movable reciprocating plunger, of a cam member adapted to engage the end of said plunger to move it in one direction, a spring member secured to the plunger to move it in the opposite direction, said cam member comprising an S-shaped member having a double-cam face and a central passage, means for holding the plunger in engagement with the cam-face and means for imparting rotary motion to the cam, substantially as shown and described.

8. An apparatus of the class described, comprising in combination with a baling-press having a laterally-movable reciprocating plunger, of a power mechanism therefor, said power mechanism comprising a drive-shaft vertically mounted in the central longitudinal plane of the press, an S-shaped cam member secured to said shaft, a sweep-arm secured to said shaft for rotating the same, said S-shaped cam member including a plurality of cam portions spaced apart to form a passage-way, a friction-roller on the end of said plunger for coöperating with the cam, means for holding the plunger with its friction-roller in engagement with the cam, means for releasing said plunger from said cam and forcing it through the passage-way thereof as the friction-roller comes in alinement therewith substantially as shown and described.

9. An apparatus of the class described, comprising in combination with a baling-chamber, and a plunger including a piston-rod and a piston-head longitudinally reciprocable with respect to said baling-press, of an S-shape cam for coöperating with said piston to reciprocate the same means for releasing said piston from said cam at times, said piston being laterally movable in a plane at right angles to the axis of the cam, means for normally holding said piston in a longitudinal plane with the axis of the cam and means for moving said piston in one direction when released from said cam substantially as shown and described.

10. An apparatus of the class described, the combination with a reciprocating member having lateral movement, of a power mechanism for reciprocating said member and comprising an S-shaped cam member having double-cam portions, said double-cam portions being separated at the center of the S-shaped cam member to leave a passage-way, means for rotating said cam member, means for forcing the reciprocating member through said cam passage-way when in alinement therewith, means for normally holding said reciprocating member in alinement with said cam passage-way, substantially as shown and described.

809,845. VARIABLE-SPEED MECHANISM. RICHARD H. ROSSWARNE, Covington, Ky. Filed July 13, 1905. Serial No. 269,530.



Claim.—1. In an expansible pulley, a volute rim, spiral guides on opposite sides of the rims, and means engaging the rim for moving it on the guides while the guides are held stationary, to expand and contract the pulley.

2. In an expansible pulley, a rim, spiral guides on the opposite sides of the rim, and means engaging the rim at one end only to wind and unwind the same.

3. In an expansible pulley, a rim, and mechanical means engaging the rim at the inner end only to wind and unwind the same.

4. In an expansible pulley, the combination with a pair of members each having a spiral track thereon, of a plurality of bars supported at opposite ends on tracks and adapted to travel thereon, said bars gradually increasing in height from the outer end of the spirals to the inner ends, means connecting said bars, and means engaging the inner bar to cause the bars to travel on the tracks.

5. In an expansible pulley, the combination with a pair of members having spiral tracks thereon, of a plurality of bars supported at opposite ends on the tracks and adapted to travel thereon, means connecting the bars, and means engaging only the inner bar to cause the bars to travel on the tracks.

6. In an expansible pulley, the combination with a pair of members having spiral tracks thereon, of a continuous rim guided by said tracks, to expand and contract the pulley, and means engaging only the inner end of the rim to expand and contract the pulley.

7. In an expansible pulley, the combination of a pair of members having spiral tracks thereon, supports of varying height adapted to travel on said tracks, an expansible rim surrounding the supports, and means engaging the rim to cause it to travel on the track members while the track members are stationary.

8. The combination with a pair of spiral track members, of a rim, a plurality of connected bars adapted to travel on said tracks, a rotary member mounted between the spiral members, a link connecting the rotary member and the bars, and means for rotating the rotary member.

9. The combination with a pair of spiral track members, of a rim adapted to travel on said track members, a rotary member located between the track members, a link connecting the rotary member and the rim, and means for rotating the rotary member.

10. The combination with a pair of spiral track members, of a rim adapted to travel on the spiral track members, a rotary nut having connection with the rim to cause the rim to travel on the track members, and a screw movable axially through the nut.

11. The combination with the rim and a mounting for the same permitting it to move in a spiral direction, of a rotary nut connected to the rim to cause the rim to move on its mounting and a screw movable axially within the nut to cause the latter's rotation.

12. The combination of a pair of axially-movable screws, a connection between the screws for causing them to move simultaneously in opposite directions, a pair of pulleys having rims adapted to travel in a spiral direction, a rotary nut for each pulley receiving rotation from one of the screws, and connection between each nut and one of the rims.

13. The combination with a pair of disks, each having a hollow bearing and a spiral groove, of a rim adapted to travel in said groove, a screw having an axially-interrupted portion, and movable axially within the hollow bearings, a key connecting the two disks and extending through the hollow bearings and preventing the turning of the screws, a nut surrounding the screw between the disks, and connection between the nut and the rim.

14. The combination with a pair of disks, each having a hollow bearing and a spiral groove, of a rim adapted to travel in said groove, a screw having an axially-interrupted portion and movable axially within the hollow bearings, a key connecting the two disks and extending through the hollow bearings and preventing the turning of the screws, a nut surrounding the screw between the disks, and a link connection between the nut and the rim.

15. The combination with the spiral track members, of bars traveling on said members and gradually increasing in height from the outer end of the spiral and means for causing the bars to travel on the track members.

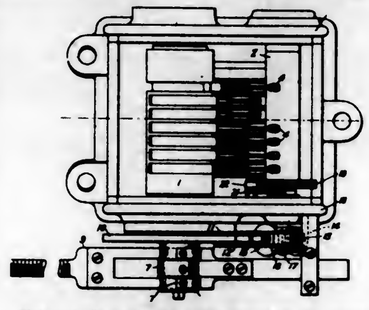
16. The combination with the spiral track members, of bars traveling on said members and gradually increasing in height from the outer end of the spiral, the inner bars being convex on their outer faces, and a continuous expansible rim secured to said bars and means for causing the bars to travel on the track members.

17. The combination of a pair of members, each having a spiral track thereon, the distance between the portions of each spiral track gradually diminishing toward the center, and a rim movable on the spiral tracks.

809,846. METHOD OF MANUFACTURING LINED OR ENVELOPED TUBES OF PARCHMENT-PAPER. GUSTAV H. SACHSENRÖDER, Barmen, Germany. Filed Jan. 7, 1905. Serial No. 240,102.

Claim.—A method of manufacturing lined or enveloped tubes of parchment-paper, consisting in passing a strip of paper through a parchmentizing bath, then uniting by pressure said strip as it leaves the bath with a correspondingly wide strip of material to form a composite strip, then bending said composite strip together in the direction of its length to have the longitudinal edges thereof overlap, uniting the overlapping edges of said strip together by pressure to form the tube, and then passing the completed tube through a water-bath to complete the parchmentizing thereof.

809,847. CONTROLLER FOR TURBINES. FREDERICK SANDERSON, Rugby, England, assignor to General Electric Company, a Corporation of New York. Filed July 3, 1905. Serial No. 268,696.



Claim.—1. In an electric-circuit controller, the combination of a cam-cylinder, switch members adapted to be actuated by the cam-cylinder in predetermined order, and means for causing the switch members to open the circuit with a quick movement, substantially as described.

2. In an electric-circuit controller, the combination of a rotatable cam-cylinder, one or more switch-levers actuated thereby, a rotatable contact member, and intermittently-operated mechanism driven by the cam-cylinder for causing the contact member to be rotated in a step-by-step manner.

3. In an electric-circuit controller, the combination of a rotatable contact-cylinder, switch members adapted to make contact therewith, a cam-cylinder for moving the switch members into and out of engagement with the contact-cylinder, a device for imparting a step-by-step movement to the cam-cylinder, and means operated by said device for turning the contact-cylinder step by step.

4. An electric-circuit controller comprising a rotatable cam-cylinder, switch members actuated thereby, a rotatable contact-cylinder adapted to be engaged by the switch members, a cam-disk attached to the cam-cylinder, a spring-controlled lever actuated by the cam-disk, a ratchet-wheel arranged to rotate the contact-cylinder, and a pawl engaging with the ratchet-wheel and actuated by the lever.

5. In a circuit-controller, the combination of a contact element, a plurality of switch members arranged to make contact therewith, a device having cam projections thereon for actuating the switch members, a second cam moving with the device and having projections thereon which alternate with those on the device, and a spring-pressed means acting on and insuring a step-by-step movement of the second cam and a quick break of the circuit by the switch members.

6. In a circuit-controller, the combination of a cam which has a to-and-fro motion, a contact member, switch members actuated by the cam and adapted to make and break circuit on the contact member, and means for driving the contact member from the cam which transforms the step-by-step motion of the cam into rotary motion of the switch member.

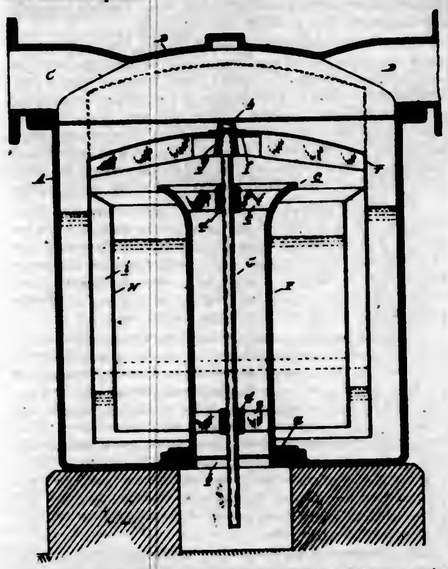
7. In a circuit-controller, the combination of a moving element, a means for oscillating it, a second moving element, means driven by the first element for rotating the second, and switch members actuated by one element and contacting with the second.

809,848. GOVERNOR FOR SUCTION GAS-PRODUCERS. ERICH SARNEKE, Lansing, Mich., assignor to American Suction Gas Producer Company, Lansing, Mich., a Corporation of Michigan. Filed June 26, 1905. Serial No. 267,139.

Claim.—1. A governor of the character described comprising a stationary casing forming a gas-chamber and connected with the gas supply and outlet conduits, and a balanced displacement member within said casing for varying the capacity of said gas-chamber.

2. A governor of the character described comprising a stationary casing containing a gas-chamber connected with the gas supply and outlet conduits, and a hydrostatically-balanced displacement member within said casing for varying the capacity of said gas-chamber.

3. A governor of the character described comprising a stationary casing inclosing a gas-chamber connected with the gas supply and outlet conduits, a bell hydrostatically balanced within said casing, and a connection between the chamber within said bell and the external atmosphere.



4. A governor of the character described comprising a casing containing a gas-chamber connected with gas supply and outlet conduits, a displacement-bell hydrostatically balanced within said casing and a guide-stem and coöperating bearing depending axially and vertically from said bell, substantially as described.

5. A governor of the character described comprising a cylindrical casing containing a gas-chamber connected with gas supply and outlet conduits, a cylindrical bell hydrostatically balanced within said casing, a central tube within said casing and bell through which communication is established between the chamber in the bell and the external atmosphere, an axially and vertically arranged guide-stem depending from said bell, and a bearing within said central tube with which said stem slidingly engages.

6. A governor of the character described comprising a casing inclosing a gas-chamber, alined induction and eduction gas-conduits connecting with said casing, and a displacement member within said casing for varying the capacity of the gas-chamber.

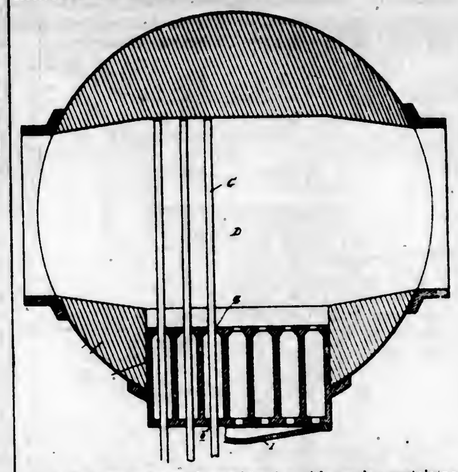
7. A governor of the character described comprising a cylindrical casing, a cap for the upper end of said casing having induction and eduction gas-conduits connected therewith and in alinement with each other, and a displacement-bell hydrostatically balanced within said casing.

809,849. GAS-PRODUCER. ERICH SARNEKE, Lansing, Mich., assignor to American Suction Gas Producer Company, Lansing, Mich., a Corporation of Michigan. Filed June 26, 1905. Serial No. 267,140.

Claim.—1. In a gas-producer, the combination with a casing containing a fuel-chamber and a hearth upon which the mass of fuel is normally supported, of means for temporarily supporting the fuel above the hearth comprising a series of separate grate-bars, and parallel centrally-enlarged guide-bearings through which said bars may be successively inserted and forced through the mass of fuel.

2. In a gas-producer, the combination with a casing containing a fuel-chamber and a hearth upon which the fuel in said chamber is normally supported, of means for temporarily supporting the fuel above said hearth comprising a series of separate grate-bars, and a bed within said casing at one side of the fuel-chamber having centrally-enlarged slots forming parallel guide-bearings through which said bars may be successively inserted or removed.

3. In a gas-producer, the combination with a casing containing a fuel-chamber and a hearth for normally supporting the fuel within said chamber, of the bed H arranged at one side of said casing having the parallel slots therein, the grate-bar G separately insertible through said slots and extending in parallel relation across the fuel-chamber above the hearth, and the detachable cap I for closing said slotted bed when the bars are removed.



4. In a gas-producer, the combination with a casing containing a fuel-chamber and a hearth upon which the mass of fuel is normally supported, of a grate insertible into said chamber above the hearth to form a temporary support for the fuel, and a centrally-enlarged bearing at the side of the casing through which the grate is inserted forming a support for the projecting portion of the latter.

5. In a gas-producer the combination with a casing containing a fuel-chamber and a hearth upon which the mass of fuel is normally supported, of a removable bed-plate inserted within a slot in one side of said casing above the hearth for the purpose described.

6. In a gas-producer, the combination with a casing containing a fuel-chamber and a hearth for normally supporting the fuel within said chamber, of a bed-plate inserted within a slot in said casing above the hearth forming a guide-bearing and support for temporary grate-bars, said bed-plate being removable to provide access to the fire-pot for dislodging adhering clinkers.

809,850. BOTTLE-CORKING MACHINE. ROBERT J. SCHLOSSER and HENRY R. FISHER, Warren, Pa., assignors to The Pisc Company, Warren, Pa., a Corporation of Pennsylvania. Filed Nov. 1, 1904. Serial No. 230,989.

Claim.—1. A bottle-corking machine involving a cork-guide plate having an opening for the passage of a cork, the wall of said opening having embedded therein a flexible washer saturated with a lubricant to facilitate the passage of the cork therethrough.

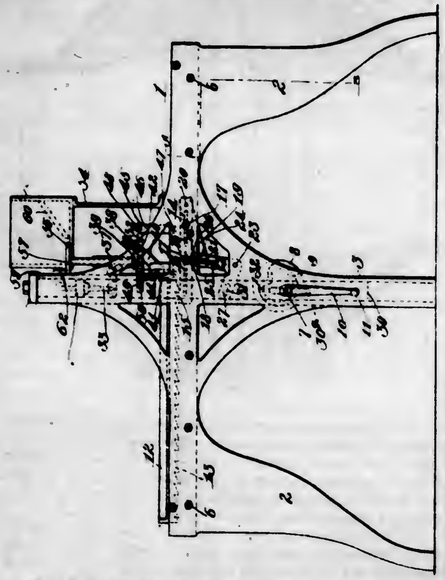
2. A bottle-corking machine embodying a cork-feeding mechanism, said mechanism comprising a forwardly and rearwardly movable pivoted cork-guide plate having an opening for the passage of a cork, and a forwardly and rearwardly movable cork-feed plate having an opening for the passage of a cork and coöperating with said guide-plate, combined with means for moving the said plates.

3. A bottle-corking machine embodying a forwardly and rearwardly movable pivoted cork-guide plate having a plurality of openings for the passage of corks, and a forwardly and rearwardly movable cork-feed plate having a plurality of openings corresponding to the number of the openings in the cork-guide plate and coöperating with said guide-plate, combined with means for suitably moving the said plates.

4. A bottle-corking machine embodying a cork-feeding mechanism comprising a forwardly and rearwardly movable pivoted cork-guide plate having an opening for the passage of a cork, the wall of said opening having embedded therein a flexible washer saturated with a lubricant to facilitate the passage of a cork, and a forwardly and rearwardly movable cork-feed plate having an opening for the passage of a cork and coöperating with said guide-plate, combined with means for suitably operating the said plates.

5. A bottle-corking machine embodying a cork-feeding mechanism comprising a forwardly and rearwardly movable pivoted cork-guide plate having a plurality of openings for the passage of

corks, the wall of each of said openings having embedded therein a flexible washer saturated with a lubricant to facilitate the passage of the corks, and a forwardly and rearwardly movable cork-feed plate having a plurality of openings corresponding in number to the openings in the guide-plate and coöperating with said guide-plate, combined with means for suitably operating said plates.



6. A bottle-corking machine involving a cork-feeding mechanism comprising a forwardly and rearwardly movable pivoted cork-guide plate having a tapering opening for the passage of a cork, the wall of said opening having embedded therein a flexible washer saturated with a lubricant to facilitate the passage of a cork, and a forwardly and rearwardly movable cork-feed plate having an opening for the passage of a cork, said opening in the feed-plate coöperating with the opening in the guide-plate, combined with means for operating the said plates.

7. A bottle-corking machine involving a cork-feeding mechanism comprising a forwardly and downwardly and rearwardly and upwardly movable pivoted cork-guide plate having an opening for the passage of a cork, and a forwardly and downwardly and rearwardly and upwardly movable cork-feed plate having an opening for the passage of a cork, the opening in the feed-plate coöperating with the opening in the guide-plate, combined with means for operating said plates.

8. A bottle-corking machine involving a cork-feeding mechanism comprising a forwardly and downwardly and rearwardly and upwardly movable pivoted cork-guide plate having a tapering opening for the passage of a cork, and a forwardly and downwardly and rearwardly and upwardly movable cork-feed plate having an opening for the passage of a cork, the opening in the feed-plate coöperating with the opening in the guide-plate, combined with means for operating said plates.

9. A bottle-corking machine embodying a cork-feeding mechanism comprising a forwardly and downwardly and rearwardly and upwardly movable pivoted cork-guide plate having a tapering opening for the passage of a cork, the wall of said opening having embedded therein a flexible washer saturated with a lubricant to facilitate the passage of a cork, and a forwardly and downwardly and rearwardly and upwardly movable cork-feed plate having an opening for the passage of a cork, the opening in the feed-plate coöperating with the opening in the guide-plate, combined with means for suitably operating said plates.

10. A bottle-corking machine embodying a cork-feeding mechanism comprising a cork-guide-plate having a passage for a cork, a cork-feed plate having a passage for a cork, said plates coöperating with each other, and means for moving forwardly said feed-plate in advance of the guide-plate and then moving forwardly the two plates in unison.

11. A bottle-corking machine embodying a cork-feeding mechanism comprising a cork-guide plate having a passage for a cork, a cork-feed plate having a passage for a cork, said plates coöperating with each other, and means for moving said feed-plate in advance of the guide-plate and then moving the two plates in unison forwardly and downwardly and upwardly and rearwardly.

12. A bottle-corking machine embodying a cork-feeding mechanism comprising a cork-feed tube, a movable feed-plate provided with an opening adapted to receive a cork from said tube, a cork-guide plate provided with a cork-passage and arranged in operative relation with respect to said feed-plate, said passage in said guide-plate coöperating with said opening in said feed-plate, and means for moving said feed-plate in advance of the guide-plate to shut off the discharge of corks from said tube and then moving the two plates in unison forwardly and downwardly and rearwardly and upwardly.

13. A bottle-corking machine embodying a cork-feeding mechanism comprising a cork-feed tube, a forwardly-movable feed-plate provided with an opening adapted to receive a cork from said tube, a forwardly-movable cork-guide plate provided with a cork-passage and arranged in operative relation with respect to said feed-plate, said passage in said guide-plate coöperating with said opening in said feed-plate, and means for operating said plates.

14. A bottle-corking machine embodying a cork-feeding mechanism comprising a cork-feed tube, a feed-plate provided with a cork-receiving opening coöperating with the discharge end of said feed-tube, a cork-guide plate having a cork-passage and arranged below and adapted to support said feed-plate, said passage in said guide-plate coöperating with the opening in the feed-plate, a pair of pivoted levers for supporting said guide-plate; a pair of pins carried by the guide-plate, an oscillatory arm connected with said feed-plate and adapted to operate said feed-plate in advance of said guide-plate and to engage said pins of the guide-plate for operating the said plates in unison, and a reciprocatory element engaging with and adapted to operate said arm.

15. A bottle-corking machine embodying a cork-feeding mechanism comprising a plurality of cork-feed tubes, a feed-plate provided with a plurality of cork-receiving openings coöperating with the discharge end of said feed-tubes, a cork-guide plate having a plurality of cork-passages and arranged below and adapted to support said feed-plate, said passages in said guide-plate coöperating with the openings in the feed-plate, a pair of pivoted levers for supporting said guide-plate, a pair of pins carried by the guide-plate, an oscillatory arm connected with said feed-plate and adapted to operate said feed-plate in advance of said guide-plate and to engage said pins of the guide-plate for operating said plates in unison, and a reciprocatory element engaging with and adapted to operate said arm.

16. A bottle-corking machine involving a bottle-feeding mechanism comprising a carrier, a cog-rack secured to the lower face thereof, a toothed pulling-arm adapted to engage with the teeth of said rack for intermittently moving said carrier, a pair of crank-arms for operating said toothed pulling-arm forwardly and rearwardly, causing said arm to travel over the teeth of the rack when moved forwardly and engaging in the teeth of the rack when moved rearwardly, and a pair of bell-crank levers for operating said crank-arms.

17. A bottle-corking machine involving a bottle-feeding mechanism comprising a carrier, a cog-rack secured to the lower face thereof, a toothed pulling-arm adapted to engage with the teeth of said rack for intermittently moving said carrier, a pair of crank-arms for operating said toothed pulling-arm forwardly and rearwardly, causing said arm to travel over the teeth of the rack when moved forwardly and engaging in the teeth of the rack when moved rearwardly, a pair of bell-crank levers for operating said crank-arms, and a reciprocating element for operating said bell-cranks.

18. A bottle-corking machine involving a bottle-corking mechanism comprising a movable carrier, a cog-rack carried thereby, a shifting means engaging with the cog-rack for imparting movement to the carrier, and means for varying the point of engagement between said shifting means and said rack to change the extent of the movement of the carrier.

19. A bottle-corking machine involving a movable carrier, a cog-rack carried thereby, a shiftable pulling-arm adapted to engage with the teeth of said rack for imparting an intermittent movement to the carrier, said arm provided with guide-slots, a combined guide and supporting means extending through said slots, crank-arms for operating said pulling-arm, a pair of bell-cranks connected with said crank-arms and adapted to operate them, an adjustable connection between said crank-arms and said bell-cranks for varying the throw of said cranks, thereby changing the extent of movement of the carrier, and a reciprocatory element for operating the bell-cranks.

20. A bottle-corking machine involving a cork-supplying mechanism comprising a hopper having an inclined chute arranged therein, an agitator-plate mounted in the hopper and provided with openings, said hopper provided with a discharge means coöperating with the openings in the plate, a vibratory arm for agitating said plate, means for retaining said plate in position, and a reciprocatory element for operating said vibratory arm.

21. A bottle-corking machine involving a bottle-feeding mechanism, a lever mechanism for imparting movement to said feeding mechanism, a cork-feeding mechanism, a lever mechanism for operating said cork-feeding mechanism, a cork-driving mechanism, a reciprocatory element operatively connected with said lever mechanisms and said cork-driving mechanism for operating said mechanisms, a rotatable cam mechanism for operating said reciprocatory element, and means for operating said rotatable cam mechanism.

22. A bottle-corking machine involving a bottle-carrier, a lever mechanism engaging therewith for imparting an intermittent movement thereto, a cork-driving mechanism, a cork-feeding means, a lever mechanism connected with said cork-feeding means for operating it, a reciprocatory element having a portion of its length toothed and engaging with the lever mechanism for the cork-feeding means for operating said mechanism, said element connected with said cork-driving mechanism for operating it, means carried by said element and engaging in the lever mechanism for operating the carrier for operating it, and means for operating said element.

23. A bottle-corking machine involving a bottle-carrier, a lever mechanism engaging therewith for imparting an intermittent movement thereto, a cork-driving mechanism, a cork-feeding means, a lever mechanism connected with said cork-feeding means for operating it, a reciprocatory element having a portion of its length toothed and engaging with the lever mechanism for the cork-feeding means for operating said mechanism, said element connected with said cork-driving mechanism for operating it, means carried by said element and engaging in the lever mechanism for operating the carrier for operating it, a cam mechanism engaging with and operating said element, and means for operating said cam mechanism.

24. A bottle-corking machine involving a bottle-feeding mechanism, a cork-feeding mechanism, a cork-driving mechanism, a cork-supplying mechanism coöperating with said cork-feeding mechanism and provided with an agitator, a reciprocatory element adapted to operate said agitator and said bottle-feeding, cork-feeding and cork-driving mechanisms, said element provided with a pair of pins, and means engaging said pins for imparting a reciprocatory movement to said element.

25. A bottle-corking machine involving a bottle-feeding mechanism, a cork-feeding mechanism, a cork-driving mechanism, a cork-supplying mechanism coöperating with said cork-feeding mechanism and provided with an agitator, a reciprocatory element adapted to operate said agitator and said bottle-feeding, cork-feeding and cork-driving mechanisms, said element provided with a pair of pins, and rotatable means engaging said pins for imparting a reciprocatory movement to said element.

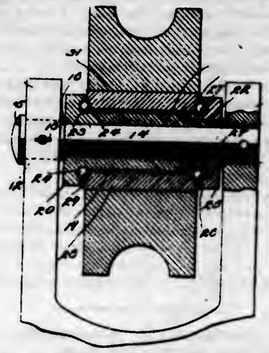
809,851. ROASTER. JOHN H. SCOTT, Philadelphia, Pa. Filed June 14, 1905. Serial No. 265,120.

Claim.—1. In a roaster, a suitable pan, a frame mounted to rotate therein, dippers on the frame, and spits run through the frame and having ends bent to embrace the edges of the frame.

2. In a roaster, a suitable pan, a frame mounted to rotate in the pan, dippers on the frame, spits run through the frame at the side of the axis, said spits having hooked ends to engage the frame.

3. In a roaster, a pan, a frame having end apertures, mounted to rotate therein, a handle for turning the frame, dippers on the frame, spits run through the apertures of one end of the frame and having their ends lying in the apertures of the opposite end of the frame, and hooks on the spits adapted to embrace the edges of the frame.

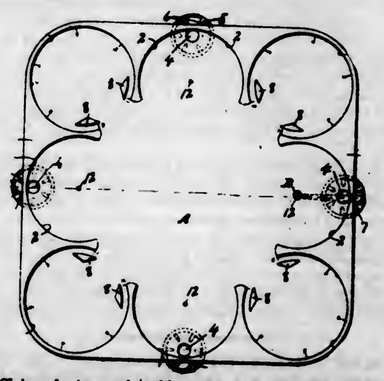
809,852. BALL-BEARING TROLLEY-WHEEL BUSHING. HARLOW SHARPE, Reading, Pa. Filed Apr. 4, 1905. Serial No. 253,805.



Claim.—1. The combination with a trolley-wheel rim and a trolley-harp having a cross-sectionally-angular pin engaged therein of a sleeve having a cross-sectionally-angular longitudinal passage in which the pin is snugly fitted, said sleeve comprising a major end portion a reduced middle portion and a further reduced and threaded end portion and having a ball-race in the angle between the major and intermediate portions, a bearing-cone engaged upon the threaded portion of the sleeve and having a race, a ring disposed about the sleeve and having end races in coöperative relation to the races of the sleeve and cone respectively, said ring being snugly fitted in the rim, and balls in the races.

2. A bushing for trolley-wheels comprising a sleeve comprising a major end portion, an intermediate reduced portion and a further reduced end portion provided with threads, said sleeve having a race in the angle between its major and intermediate portions, a cone engaged upon the threaded end portion of the sleeve and provided with a race, and a ring encircling the sleeve and having end races in coöperative relation to the sleeve and cone respectively and bearing-balls engaged in the races.

809,853. GAME-BOARD. ISAAC SILVERMAN, Syracuse, N. Y., assignor of one-half to James Spohn, Syracuse, N. Y. Filed Mar. 6, 1905. Serial No. 248,578.



Claim.—1. A game-board having a series of circular ball-races, one of which is provided with an opening in its bottom and a receptacle underlying the opening and having a series of compartments for receiving the ball.

2. A rectangular game-board having a circular raceway in each corner and one in each side, each raceway having its side toward the center of the board open, one of the raceways having an opening in its bottom substantially midway between its ends.

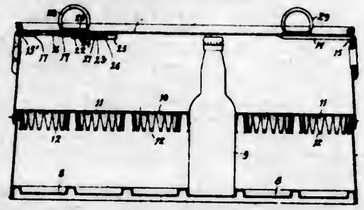
3. A game-board having a raised marginal flange formed with curved ball-races having open sides facing the center of the board, some of the races being provided with pockets to receive the ball and an underlying receptacle for each pocket, each receptacle having a series of compartments to receive the ball.

4. A game-board having a raised marginal flange formed with curved ball-races having open sides facing the center of the board, some of the races being provided with pockets to receive the ball and a revoluble receptacle centrally under each pocket and having a series of radial compartments to receive the ball.

5. A game-board having a flat bottom with four sides, and a raised marginal flange extending around the sides and corners of the bottom, said flange having a series of circular recesses open at the side toward the center of the board, alternate recesses each having an opening in its bottom and its open side located in a line tangential to one side of one of the other recesses.

6. A game-board having four sides and a raised flange surrounding said sides and corners of the bottom, the corners and sides of the flange each having a circular recess open at one side toward the center of the board, the bottom of each side recess having an aperture therethrough, and revoluble receptacles underlying the apertures and each provided with a series of numbered compartments.

809,854. **SHIPPING-CRATE.** FRANK SOCHUREK, Sr., Milwaukee, Wis. Filed Oct. 31, 1904. Serial No. 230,668.



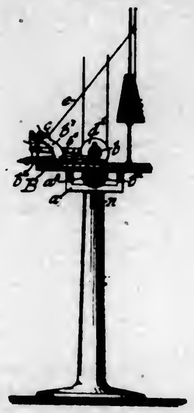
Claim.—1. In a bottle-crate, the combination with a box or receptacle consisting of an upper and a lower section, the lower section provided with a bottom piece and the upper section turned upwardly at its lower edges and extending horizontally to form an integral horizontal partition, the said partition provided with openings for the passage of the bottles therethrough, and the upper edge of the lower section of the box being fitted against and secured to the upturned bead at the lower edges of the upper section, of means within the box for supporting the lower ends of the bottles.

2. In a bottle-crate, the combination with a box or receptacle consisting of an upper and a lower section, the lower section provided with a bottom piece and the upper section turned upwardly at its lower edges and extended horizontally to form an integral horizontal partition, the said partition provided with openings for the passage therethrough of the bottles, and the bordering edges of said openings having spring-fingers depending therefrom, and the upper edge of the lower section of the box being fitted against and secured to the upturned bead at the lower edge of the upper section, of means within the box for supporting the lower ends of the bottles.

3. A bottle-crate consisting of a box or receptacle comprising an upper and a lower section, the lower section having its lower edges bent upwardly and extended horizontally to form an integral raised bottom piece adapted for supporting the lower ends of bottles, and the upper section turned upwardly at its lower edges, and extended horizontally to form an integral horizontal partition, the said partition provided with openings for the passage of the bottles, and the upper edge of the lower section of the box being fitted against and secured to the upturned bead at the lower edge of the upper section.

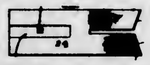
809,855. **MACHINE FOR SEWING LOOPED FABRICS.** HYRAM SHAW, New York, N. Y., and FRANK L. HINMAN, Stamford, Conn.; said Hinman assignor to said Shaw. Filed May 13, 1904. Serial No. 207,969.

Claim.—1. In a machine for sewing looped fabrics, the combination of a bed-plate provided with an opening, a rotatable looper-point ring guided on said bed-plate and provided on its lower surface with a plurality of gear-teeth, a driving-shaft mounted on said bed-plate within said point-ring and above said opening, a second shaft mounted in bearings beneath said bed-plate and carrying a ratchet-wheel, a gear-wheel on said second shaft meshing with the gear-teeth on said point-ring, an eccentrically-mounted pawl on said driving-shaft extending downwardly through the opening in the bed and engaging said ratchet-wheel, a needle and a looper adjacent said looper-point ring, and means for transmitting movement from said driving-shaft to said needle and looper.



2. In a machine for sewing looped fabrics, the combination of an upright supporting-standard, a yoke supported on the same, a bed-plate mounted on the yoke, a driving-shaft journaled on the bed-plate, a looper-point ring guided in the bed-plate and provided with a circular rack at the under side, a second shaft supported in bearings at the under side of the bed-plate and passing through the yoke, a pinion on the second shaft meshing with the circular rack on the looper-point ring, means for transmitting intermittent rotary motion from the driving-shaft to the second shaft, an oscillating needle, a laterally-reciprocating looper, and mechanism supported on the bed-plate for transmitting motion to the needle and looper.

809,856. **AUGER-BIT.** JACOB STEIN, Coal Valley, Pa., assignor of one-third to Luther K. Yoder and one-fourth to Franklin A. Barnsdell, Pittsburg, Pa. Filed Oct. 7, 1905. Serial No. 281,844.

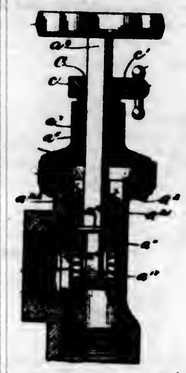


Claim.—1. The combination of an auger consisting of a blade having a straight flat end portion, which end portion is slotted centrally of its width, and with threaded openings intersecting the slot, of a blade having a longitudinally-disposed groove on each side and a transversely-disposed slot, said blade entering the slot in the auger and the grooves in the blade receiving the side walls of the slot in the auger and a screw extending through the threaded openings in the auger, and through the slot in the bit.

2. The combination with an auger having a flattened end portion, said end portion being provided with a longitudinally-disposed slot forming side arms, and a transverse opening intersecting said slot, of a bit having a longitudinally-disposed groove on each side and a transverse opening extending from the bottom of one groove to the bottom of the other groove, said bit seating in the slot in the end portion of the auger and said grooves in the bit receiving the side arms of the end portion of the auger and a fastening device passing through the opening in the end portion of the auger and the opening in the bit.

809,857. **SLIDE-GATE VALVE.** ALFRED STENWALL, Kewanee, Ill. Filed Dec. 24, 1904. Serial No. 238,206.

Claim.—1. In a slide-gate valve, the combination with the valve-body provided with a passage therethrough, of a chamber disposed at an angle to the passage and communicating therewith, rack-teeth disposed on the walls of the chamber, a valve-stem carrying an integral gear-pinion and a swiveled yoke toward its lower end, the yoke being formed with an opening therethrough, gates provided with projections on their inner faces adapted to enter the opening of the yoke, and provided along their edges with spur-teeth in mesh with the teeth of the gear-pinion on the valve-stem and with the rack-teeth disposed on the walls of the chamber, and cams on the ends of the projections of the gates, adapted to engage each other when the gates approach their seats, thus to spread the gates apart and cause them firmly to engage their seats.



2. In a slide-gate valve, the combination with the valve-body provided with a passage therethrough, of a chamber disposed at an angle to the passage and communicating therewith; rack-teeth disposed on the walls of the chamber; a valve-stem carrying a gear-pinion; a gate-carrying member, comprising a substantially horizontal plate or bar swiveled on the valve-stem at its lower end, and a yoke depending from the plate and provided with an opening therethrough; gates provided with projections on their inner faces adapted to enter the opening of the yoke, and provided along their edges with spur-teeth in mesh with the teeth of the gear-pinion on the valve-stem and with the rack-teeth disposed on the walls of the chamber.

3. In a slide-gate valve, the combination with the valve-body provided with a passage therethrough, of a chamber disposed at an angle to the passage and communicating therewith; rack-teeth disposed on the walls of the chamber; a valve-stem carrying a gear-pinion; a gate-carrying member, comprising a substantially horizontal plate or bar swiveled on the valve-stem at its lower end, and an armed or forked yoke depending by its forks from the plate, said yoke being provided with an opening through its lower portion; gates provided with projections on their inner faces adapted to enter the opening of the yoke, and provided along their edges with spur-teeth in mesh with the teeth of the gear-pinion on the valve-stem and with the rack-teeth disposed on the walls of the chamber.

4. In a slide-gate valve, the combination with the valve-body provided with a passage therethrough, of a chamber disposed at an angle to the passage and communicating therewith; a hood secured over said chamber and formed with a barrel portion having a central bore; a valve-stem passing through the bore of the hood, depending into the chamber, and carrying a gear-pinion toward its lower end; means exerting pressure on the valve-stem whereby the same is frictionally held in any desired position of vertical adjustment; a gate-carrying member, comprising a substantially horizontal plate or bar swiveled on the valve-stem at its lower end, and an armed or forked yoke depending by its forks from the plate, said yoke being provided with an opening through its lower portion; gates provided with projections on their inner faces adapted to enter the opening of the yoke, and provided along their edges with spur-teeth in mesh with the teeth of the gear-pinion on the valve-stem and with the rack-teeth disposed on the walls of the chamber.

809,858. **WRENCH.** FRANCIS M. STRAUSS, Boulder, Colo., assignor of one-half to Lewis W. Goddard, Boulder, Colo. Filed Aug. 11, 1905. Serial No. 273,749.

Claim.—1. A wrench comprising the combination with a fixed jaw and a handle having a rack-face, of a sliding jaw longitudinally movable on said handle, a threaded arm secured to said sliding jaw, an internally-threaded collar on said threaded arm, said collar having external rings for coöperating with the rack portion of the handle, means at the free end of the arm for locking the same with the handle and a spring device carried by the handle for engaging the free end of the arm to force it away from the handle, substantially as shown and described.

2. A wrench of the character stated, comprising the combination with the fixed jaw and a handle having a rack portion, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to said slidable jaw, said arm comprising a head portion and a threaded shank, an internally-threaded collar on said threaded shank, said collar having external rings for coöperating with the rack portion of the handle, a U-shaped locking-pawl pivotally secured to the said threaded shank at its free end and adapted to lock over said handle and spring devices carried by the handle for engaging the arm to force it away from the handle, substantially as shown and described.

3. A wrench of the character stated, comprising the combination with the fixed jaw and a handle having a rack portion, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to said slidable jaw, said arm comprising a head portion and a threaded shank, an internally-threaded collar on said threaded shank, said collar having external rings for coöperating with the rack portion of the handle, a U-shaped locking-pawl pivotally secured to the said threaded shank its free end and adapted to lock over the said handle, said portion having a finger end, and a locking-spring secured to said pawl in said finger end for locking with said handle, substantially as shown and described.

4. A wrench of the class described, comprising the combination with a fixed jaw and a handle integrally secured thereto, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to the sliding jaw, said arm and said sliding jaw having co-operating shoulders, a collar longitudinally adjustable on said arm, said collar having external rings for coöperating with the rack portion of the handle, a locking-pawl pivotally secured to the free end of said arm for locking with said handle, and a spring device carried by the handle for engaging the free end of the arm to force it away from the handle, substantially as shown and described.

5. A wrench comprising the combination with a fixed jaw and a handle having a rack-face and a grooved portion, of a sliding jaw longitudinally movable on said handle, and a threaded arm pivotally secured to said sliding jaw, an internally-threaded collar on said threaded arm, said collar having external rings for coöperating with the rack portions of the handle, means at the free end of the arm for locking the same with the handle, said free end of the arm adapted to rest in the grooved portion of the handle and a spring in the grooved portion of the handle for engaging the free end of the arm to force it away from the handle substantially as shown and described.

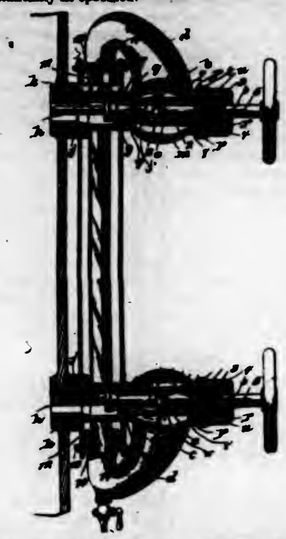
809,859. **WATER-GAGE.** FRED J. STULP, Muskegon, Mich. Filed Dec. 17, 1904. Serial No. 237,219.

Claim.—1. A water-gage for boilers having in combination a gage-glass of greater length than the distance between the horizontal attachment-holes of the boiler, and horizontal boiler-attachment devices for said glass having bent tubular extensions branching therefrom having vertically-threaded end portions for connection with said glass, substantially as specified.

2. A water-gage for boilers having in combination a gage-glass, and horizontal boiler-attachment devices for said glass having bent tubular extensions branching therefrom having vertically-threaded end portions for connection with said glass, substantially as specified.

3. A water-gage for boilers having in combination a gage-glass, and horizontal boiler-attachment devices for said glass having bent tubular extensions branching therefrom having vertically-threaded

and portions for connection with the glass, valves, and valve-controlling stems projecting through the outer ends of said attachment devices, substantially as specified.



4. A water-gage for boilers having in combination the gage-glass, boiler-attachment devices having vertical portions for connection with the glass and horizontal portions for connection with the boiler, removable valve-cases in said horizontal portions, and valves in said cases, substantially as specified.

5. A water-gage having in combination the gage-glass, boiler-attachment devices therefor having horizontal threaded portions for connection with the attachment-holes of a boiler, said horizontal portions having bent tubular extensions provided with terminal vertical portions for connection with said glass, removable valve-cases in said horizontal portions, and valves in said cases, substantially as specified.

6. A water-gage for boilers, having a swell-chambered boiler-attachment device, and, in connection therewith, a removable valve-case communicating with the chamber of the attachment device, and a valve in said case having a sectional valve-stem, substantially as specified.

7. A water-gage for boilers, having a chambered boiler-attachment device, and in connection therewith a threaded removable valve-case communicating with the chamber of said attachment device, a valve in said case having a hollow threaded controlling-valve-stem section, a spring within the same, and an automatically-movable valve-stem section, engaging said spring, substantially as specified.

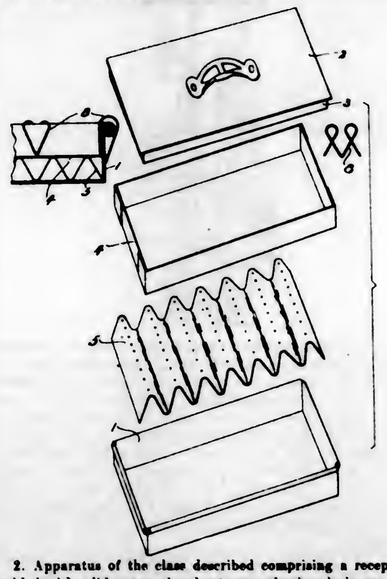
8. In a water-gage for boilers, an internally-threaded boiler-attachment device, a valve having an externally-threaded valve-stem and a removable internally and externally threaded valve-case engaging said attachment device and valve-stem, substantially as specified.

9. In combination with a boiler-attachment device of a water-gage having interior threads at each end of its chambered portion, of a removable tubular valve-case having at its inner end a subsurface thread, at its outer end of a wrench-seat collar, and a packing-nut thread and adjacent to said collar a superficially-projecting thread, substantially as specified.

10. A long-range water-gage for boilers consisting of horizontal boiler-attachment devices having bent extensions terminating in vertical mouth portions, a glass gage-tube connected to said extensions, threaded removable valve-cases in said attachment devices, sectional automatic stop-valves, and means for operating said valves as check-valves, substantially as specified.

809,860. **MEANS FOR MAKING MILK PRODUCTS AND RECOVERING MILK FLUIDS.** CHARLES M. TAYLOR, Jr., Philadelphia, Pa. Continuation of application Serial No. 169,504, filed June 6, 1903. This application filed July 23, 1904. Serial No. 217,669.

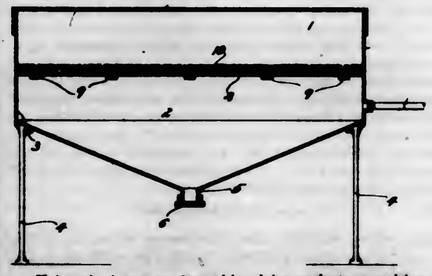
Claim.—1. Apparatus of the class described comprising the combination of a partition impermeable to the buttery or fatty constituents and permeable to the other constituents, a non-absorbent spacer, having drain-openings, arranged in contact with one face of the partition, and devices for receiving the non-buttery constituents, substantially as described.



2. Apparatus of the class described comprising a receptacle provided with a lid, a non-absorbent spacer having drain-openings and arranged upon the bottom of the receptacle, and a partition arranged above the spacer and impermeable to the fatty or buttery constituents and permeable to the other constituents, substantially as described.

3. In apparatus of the class described the combination with a partition impermeable to the fatty or buttery constituents and permeable to the other constituents, of a corrugated non-absorbent sheet provided with openings or drains, arranged in contact with one face of the partition, substantially as described.

809,861. **SUCTION APPARATUS FOR DAIRY PRODUCTS.** CHARLES M. TAYLOR, Jr., Philadelphia, Pa. Continuation of application Serial No. 137,942, filed Oct. 20, 1903. This application filed July 23, 1904. Serial No. 217,669.



Claim.—1. Apparatus for making dairy products comprising a housing provided with a cream-chamber and a vacuum-chamber, a perforated support interposed between the two, and a layer of material carried by said perforated support and permeable by the watery and impermeable by the fatty constituents of cream, substantially as described.

2. Means for making a dairy product comprising a housing provided with a cream-chamber and a vacuum-chamber and supports interposed between the two chambers, a perforated sheet detachably carried by said supports, a layer of material superposed on said sheets and permeable by the watery and impermeable by the fatty constituents of cream, substantially as described.

3. Means for making dairy products comprising a housing provided with a lid and with a bottom sloping to a discharge-orifice, a closure for said orifice, supports for the housing, perforated supports dividing the housing into a cream-chamber above and a vacuum-chamber below, exhaust connections for the vacuum-chamber, a layer of material superposed on said supports and permeable by the watery constituents and impermeable by the fatty constituents of cream, substantially as described.

4. Apparatus for making dairy products comprising a cream-chamber, a second chamber, a perforated support between the two, a layer of material carried by said support and permeable by the watery and impermeable by the fatty constituents of cream, and means adapted to create a lower atmospheric pressure in the second chamber than in the first chamber, substantially as described.

809,862. **ADJUSTABLE STILT.** JOHN TREMBLE, Caribou, Me. Filed May 19, 1905. Serial No. 261,200.

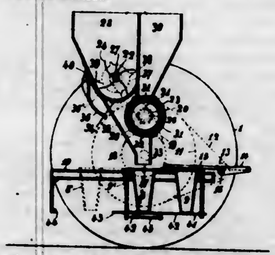
Claim.—1. An adjustable stilt comprising an upright and a rod, means for adjustably clamping the same together, a handle carried by the rod, an adjustable foot-rest carried by the upright, substantially as specified.

2. An adjustable stilt comprising an upright and a rod, grooves throughout the entire length of the upright, clamps for securing the upright and rod together, a handle upon the rod, and an adjustable foot-rest carried by the upright, substantially as specified.

3. An adjustable stilt comprising an upright and a rod, grooves at equal distances apart throughout the entire length of the upright, a sleeve clamped in the groove nearest the upper end of the upright, the rod being adapted to slide in said sleeve, a split sleeve secured to the lower end of the rod, said split sleeve being adapted to engage any one of the grooves, a handle upon the upper end of the rod, a foot-rest adjustably secured upon the upright, substantially as specified.

4. An adjustable stilt comprising an upright and a rod, grooves at equal distances apart throughout the entire length of the upright, a block at the base of the upright, the ends of the block being curved up, a sleeve clamped in the groove nearest the upper end of the upright, the rod being adapted to slide in said sleeve, a handle upon the upper end of the said rod, a split sleeve secured to the lower end of the rod and adapted to engage any one of the grooves in the upright, means for clamping said split sleeve, a U-shaped clip adapted to engage any one of the grooves, a foot-rest carried by the said clip, substantially as specified.

809,863. **COMBINED SEEDING AND MANURE-SPREADING MACHINE.** DOMENICO TOSCANI, Rocca Imperiale, Italy. Filed June 29, 1905. Serial No. 267,559.



Claim.—1. A seeding and manure-spreading machine comprising a movable frame, with two lines of hoppers, made to slide under a fixed feeding-box containing the seed and the manure, a plate sliding under the lower ends of the hoppers and provided with holes through which the seed and manure fall, means for discharging the seed, and the manure from the box into the hoppers and means whereby at the end of the course of the movable frame with the hoppers, the plate with the holes is caused to stop and its holes to come in correspondence with the openings of the hoppers.

2. A seeding and manure-spreading machine, comprising a stationary box having compartments for containing the seed and manure, each having an opening in its bottom, a chamber beneath and communicating with the seed-compartment, a channel beneath and communicating with said chamber, a rotatable drum within the chamber, having cups for receiving seed from the seed-compartment and delivering them to said channel, another channel leading from the opening in the bottom of the manure-compartment to said first-named channel, and a reciprocatory frame supported beneath the first-named channel, provided with sets of hoppers disposed a suitable distance apart.

3. A seeding and manure-spreading machine, comprising a stationary box having compartments for containing the seed and manure, each having an opening in its bottom, a chamber beneath and communicating with the seed-compartment, a channel beneath and communicating with said chamber, a rotatable drum within the chamber, having cups for receiving seed from the seed-compartment and delivering them to said channel, another channel leading from the opening in the bottom of the manure compartment to said first-named channel, and a reciprocatory frame supported beneath the first-named channel, provided with sets of hoppers disposed a suitable distance apart, said hoppers being provided with a spring-controlled valve-plate associated with the outlets thereof.

809,864. **INSULATED RECEPTACLE FOR PANEL AND SWITCH BOARDS.** WILLIAM C. TRESCOTHICK, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a Corporation of Connecticut. Filed Feb. 18, 1905. Serial No. 246,231.

Claim.—1. In combination with a panel or switchboard provided with circuit-terminals, a pair of contact members removably attached to the panel and connected respectively with said circuit-terminals, a tubular insulating-casing inclosing said contacts and resting upon the panel and a locking member intermediate one of said contacts and the tubular insulating member for locking the latter in position upon the panel.

2. In combination with a panel or switchboard provided with circuit-terminals, a pair of contact members removably secured to the base and connected respectively with said circuit-terminals, a tubular insulating-shell fitting over said contacts and a locking member arranged to fit within the insulating-tube and engage the contact member whereby said insulating-tube is locked in position upon the panel.

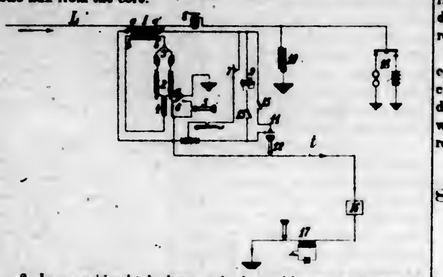
3. In combination with a panel or switchboard provided with circuit-conductors, a stud-contact connected with one of said conductors, a threaded sleeve-contact engaging the other of said conductors but insulated from the stud-contact, said parts being detachably mounted upon the panel, a shell of insulating material encircling said contacts and a locking-sleeve threaded to fit the threaded sleeve-contact and engage and lock the insulating-shell upon the panel.

4. In combination with a panel or switchboard provided with circuit-terminals, a center contact connected with one panel-terminal, a threaded sleeve-contact connected with the other panel-terminal and clamped in position on the panel by the center contact, a shell of insulating material surrounding the contacts and provided at its upper edge with a beveled surface, and a locking member having a flange overlying said beveled surface and provided with means for securing it to the threaded sleeve-contact whereby the insulating-sleeve is locked in position upon the panel.

809,865. **COMBINED TELEGRAPH AND TELEPHONE SYSTEM.** CARLO TURCHI, Ferrara, Italy. Filed Apr. 15, 1903. Serial No. 152,726.

Claim.—1. In a system of simultaneous telegraphy and telephony, the combination of a single circuit, telegraph instruments in said circuit, condensers between said circuit and the earth, a transformer having three windings one of which is inserted in series with the main circuit, a microphone-circuit connected in series with another of the windings of the transformer, a closed circuit connected

in series with the remaining winding of the transformer and divided into two branches, an iron core having the branches wound about it in opposite directions, and a telephone-receiver receiving the magnetic flux from the core.



2. In a combined telephone and telegraphic system, the combination with the main wire containing the telegraphic instruments, of a receiver-circuit, and a closed induction-circuit between the main wire and the receiver-circuit receiving both the telegraphic and the telephonic frequencies provided with means for eliminating the telegraphic frequencies by causing the difference between the two frequencies to act on the receiver.

3. In a combined telephone and telegraphic system, the combination with the main wire containing the telegraphic instruments, of a closed induction-circuit receiving the impulses from the main wire and divided into two branches, a core having the branches wound about it in different directions and a telephone-receiver receiving the magnetic flux from the core.

4. In a combined telephone and telegraphic system, the combination with the main wire containing the telegraphic instruments, of a receiver-circuit, and a closed induction-circuit between the main wire and the receiver-circuit provided with means for eliminating the telegraphic frequencies, and a microphone-circuit connected with the main wire independently of the closed induction-circuit.

5. In a combined telephone and telegraphic system, the combination with the main wire containing the telegraphic instruments, of a receiver-circuit, and a closed induction-circuit between the main wire and the receiver-circuit provided with means for eliminating the telegraphic frequencies, a microphone-circuit connected with the main wire independently of the closed induction-circuit, and a relay between the receiving-circuit and the microphone-circuit.

6. In a combined telegraph and telephone system, the combination with a single main wire, of telegraph instruments in circuit with the main wire, a winding in the main wire, a closed circuit having a winding adjacent the winding of the main wire and divided into two branches, a core having the branches of the closed circuit wound about it in opposite directions, a receiver-circuit, and a winding in the receiver-circuit receiving the magnetic flux from the core of the closed circuit.

7. In a combined telegraph and telephone system, the combination with a single main wire, of telegraph instruments in circuit with the main wire, a winding in the main wire, a closed circuit having a winding adjacent the winding of the main wire and divided into two branches, a core having the branches of the closed circuit wound about it in opposite directions, a receiver-circuit, a winding in the receiver-circuit receiving the magnetic flux from the core of the closed circuit, a microphone-circuit, and a winding in the microphone-circuit adjacent the winding in the main wire.

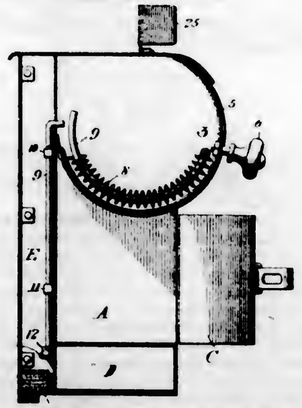
8. In a combined telegraph and telephone system, the combination with a single main wire, of telegraph instruments in circuit with said main wire, a winding in the main wire, a closed circuit having a winding adjacent the winding of the main wire and divided into two branches, a core having the branches of the closed circuit wound about it in opposite directions, a receiver-circuit, a winding in the receiver-circuit receiving the magnetic flux from the core of the closed circuit, a microphone-circuit, a winding in the microphone-circuit adjacent the winding in the main wire, and a relay between the receiver-circuit and the microphone-circuit.

9. In a system of simultaneous telegraphy and telephony, the combination of a line-wire, telegraph instruments connected with the line-wire, condensers connecting the line-wire and a conductor, a receiver-circuit, a conductor interposed between the line-wire and the receiver-circuit divided into two branches, a core having the branches wound about it in opposite directions and from which the receiver-circuit receives magnetic flux, and a microphone-circuit connected with the line-wire independently of the two branches.

10. In a system of simultaneous telegraphy and telephony, the combination with a single line-wire containing the telegraphic instruments, a conductor divided into two branches and branched from the line-wire, a core having the branches of the branched conductor wound about it in opposite directions, and a receiving-circuit receiving magnetic flux from the core.

11. In a system of simultaneous telegraphy and telephony, the combination with the line-wire and its telephonic apparatus, of a circuit connected at one end to the line, and at the other to the earth, divided in two branches each containing condensers and inductances, wound differentially around a core from which a telephone-receiver receives inductively the magnetic flux.

809,866. MAIL-BOX. THOMAS J. R. TURNER, Taylor, Iowa. Filed Sept. 12, 1905. Serial No. 278,202.



Claim.—1. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, a compartment for outgoing mail adapted to be opened and closed, means for locking said compartment for outgoing mail in closed position, said closure engaging with said locking means to unlock the last-mentioned compartment when said closure is open, and means for automatically opening the last-mentioned compartment.

2. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, said closure when open permitting access to the upper portion of said compartment, but extending across and closing communication with the lower portion of said compartment; a compartment for outgoing mail adapted to be opened and closed, means for locking said compartment for outgoing mail in closed position; the said closure engaging with said locking means to unlock the last-mentioned compartment when said closure is open.

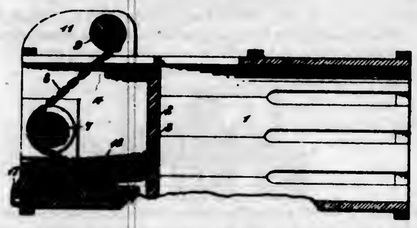
3. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, a door to said compartment, a compartment for outgoing mail adapted to be opened and closed, means for locking said compartment for outgoing mail in closed position; said closure engaging with said locking means to unlock the last-mentioned compartment when said closure is open.

4. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, a compartment for outgoing mail adapted to be opened and closed, means for locking said closure in open position; said compartment for outgoing mail engaging the said locking means to unlock said closure when the last-mentioned compartment is closed.

5. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, a compartment for outgoing mail adapted to be opened and closed, means for locking said compartment for outgoing mail in closed position, said closure engaging with said locking means to unlock the last-mentioned compartment when said closure is open, means for locking said closure in open position; said compartment for outgoing mail engaging with said closure-locking means to unlock said closure when the last-mentioned compartment is closed.

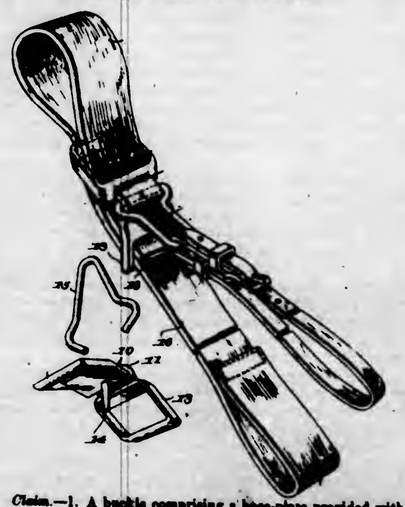
6. A mail-box comprising a compartment for incoming mail, a closure controlling communication with said compartment, a compartment for outgoing mail adapted to be opened and closed, means for locking said compartment for outgoing mail in closed position, said closure engaging with said locking means to unlock the last-mentioned compartment when said closure is open, automatic means for opening the last-mentioned compartment, and means for locking said closure in open position; said compartment for outgoing mail engaging with said locking means to unlock said closure when the last-mentioned compartment is closed.

809,867. BALING-PRESS. JOSEPH UHERBE, Greenbush, Tex. Filed Mar. 9, 1905. Serial No. 249,296.



Claim.—A press of the character described, comprising a casing having a feed-opening in its upper side and having a drum mounted on its upper side near one end, and further provided in its lower side at the said end with a longitudinally-disposed guide-element; a plunger in the casing having vertical, longitudinally-disposed, parallel side walls bearing between the upper and lower sides of the casing and on opposite sides of and guided by said guide element, a pulley mounted between said parallel side walls of the plunger and carried by the latter, a flexible element engaging said pulley and connecting said drum and said guide element, and a spring connected to the casing and the plunger, said spring acting to retract the plunger, and said drum, flexible element and pulley acting to move the plunger in the opposite direction.

809,868. MARTINGALE AND CONNECTION. FRANK R. VICKERY, Jewell, Iowa, assignor of one-half to William L. Frizzell, Davenport, Iowa. Filed May 27, 1905. Serial No. 262,675.



Claim.—1. A buckle comprising a base-plate provided with a flat bearing-surface and having one end thereof bent at an angle to said bearing-surface and provided with an opening forming a terminal loop, a second loop arranged at a reverse angle to the terminal loop, a yoke connecting the base-plate and the second loop, a stud projecting from the bearing-surface of the base-plate, and a link mounted for swinging movement in the connecting-yoke.

2. A buckle comprising a base-plate provided with a flat bearing-surface and having one end thereof bent at an angle to said bearing-surface and provided with an opening forming a terminal loop, a second loop inclined in the reverse direction and having one end thereof disposed in alinement with the free end of the terminal loop, a yoke connecting the second loop and the adjacent end of the base-plate and having its intermediate portion bowed, a stud projecting from the bearing-surface of the base-plate at its juncture with the yoke, and a link engaging the bowed portion of the yoke and mounted for swinging movement in said yoke.

809,869. BLEACHING FIBERS. JAMES WAKEFIELD, Cockermouth, England. Filed Sept. 15, 1904. Serial No. 224,547. (Specimens.)

Claim.—1. The process of bleaching textile yarn or fabrics of vegetable origin which consists in treating the material with a mixed solution of bleaching-powder and permanganate of potash and then with bisulfite of soda in solution, substantially as described.

2. The process of bleaching textile yarns or fabrics of vegetable origin which consists in treating the material with a mixed solution of bleaching-powder and permanganate of potash and then with an acidulated solution of a bisulfite substantially as described.

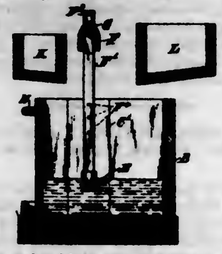
809,870. PLOW. STEPHEN S. WEAVER, Carrollton, Mo. Filed Feb. 15, 1905. Serial No. 245,733.

Claim.—1. In a plow, the combination with the share and subsoiler, the beam and handles, of two pulverizer-blades located behind the subsoiler, beams rigidly attached to said blades and extending upwardly and forwardly into connection with a part of the plow, standards connected respectively with the beams and adjustable thereon toward and from each other, a tie-rod extending between and connecting the beams, and means for adjustably connecting the standards respectively with the handles.

2. In a plow, the combination with the share and subsoiler, the beam and handles, of two pulverizer-blades located behind the subsoiler, beams rigidly attached to the pulverizer-blades and extending upwardly and thence forwardly in connection with a part of the plow, horizontally-extending lugs respectively attached to the beams, standards having at their lower ends lugs engaged with the lugs on the beams of the pulverizer-blades, means for adjustably connecting said lugs together, means for adjustably connecting the standards respectively with the handles, and a tie-rod extending between the beams of the pulverizer-blades.

809,871. PROCESS FOR PRODUCING COMPOUND INGOTS. MORRIS WEBB, Philadelphia, Pa. Filed Mar. 28, 1905. Serial No. 252,513.

Claim.—1. The process of making compound ingots of different materials in different parts, which consists in pouring molten materials of different composition into a mold side by side, and heating the materials at their point of interflowing.



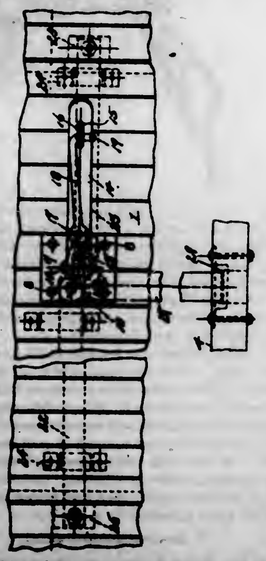
2. The process of making compound ingots of different materials in different parts, which consists in pouring molten materials of different compositions into a mold side by side, heating the materials at their point of interflowing, and cooling one of said materials in advance of the other.

3. The process of making compound ingots of different material in different parts, which consists in pouring molten materials in a mold side by side, heating the mold only at the point of interflowing of the molten materials, and maintaining a dividing-block at the point of interflowing of the material and through the disturbed portion thereof until the two materials are, though in a liquid state, without motion.

4. The process of making compound ingots of different material in different parts, which consists in pouring molten materials in a mold side by side, maintaining a dividing-block at the point of interflowing of the material and through the disturbed portion thereof until the two materials are, though in a liquid state, without motion, and heating the materials at the point of interflowing.

5. The process of making compound ingots of different materials in different parts, which consists in maintaining a heated dividing-block at the point of interflowing of the materials until the materials are without motion and then removing the dividing-block and permitting the materials to mix.

809,872. **CAR-DOOR LOCK.** WILLIAM F. WENDT, Altoona, Pa. Filed Nov. 3, 1904. Serial No. 231,260.



Claim.—In a car-door bolt, the combination with the car-door, and the car-door frame having oppositely-arranged side bolt-sockets, and a lower threshold bolt-socket, of a bearing fitted to the car-door, a rocker-spindle turning in said bearing and provided at its inner end with a rocking tumbler-plate having a pair of oppositely-arranged side cars and a single pendent bottom car, a pair of horizontally-operating reciprocatory locking-bars respectively pivoted at their inner ends to the opposite side cars of the tumbler-plate and having their outer ends engaging the side bolt-sockets, and a third vertical locking-bar having its upper end pivotally connected to the bottom car of the tumbler-plate and its lower end engaging the threshold bolt-socket, and a lever-hasp having a pivotal connection at one end with the outer end of the rocker-spindle and a separable fastening connection at its other end with the car-door.

809,873. **PANEL CUT-OUT AND RECEPTACLE.** FRANK T. WHEELER, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a Corporation of Connecticut. Filed Feb. 18, 1905. Serial No. 246,263.

Claim.—1. In combination with a panel or switchboard provided with circuit-terminals, a pair of contact members removably secured to the base and connected respectively with said circuit-terminals, one of said contacts clamping the other in position upon the panel, and an insulating-casing inclosing said contacts removably interlocked with respect to one of them and resting against the panel.

2. In combination with a panel or switchboard provided with circuit-conductors, a stud-contact connected with one of said conductors, a threaded sleeve-contact engaging the other of said conductors and surrounding the stud-contact but insulated therefrom, said parts being detachably mounted on the panel, and a shell of insulating material encircling said contact and detachably mounted upon the panel through engagement with the tubular contact member.

3. In combination with a panel or switchboard provided with circuit-terminals, a center contact connected with one panel-terminal, a threaded sleeve-contact connected with the other panel-terminal and clamped in position on the panel by the center contact, and a shell of insulating material detachably secured upon the panel through interengagement with the tubular contact and surrounding the center and tubular contact members.

4. In combination with a panel or switchboard provided with removable circuit-terminals, a center contact connected with one panel-terminal, a threaded sleeve-contact connected with the other panel-terminal and clamped in position on the board by the center contact, and a sectional insulating-sleeve detachably secured upon the panel through interengagement of one of said sections with the tubular contact.

5. In combination with a panel or switchboard provided with circuit-terminals extending along its surface, a center contact connected with one panel-terminal, a threaded sleeve-contact connected with the other panel-terminal, said sleeve-contact and circuit-terminals being clamped with reference to each other by the center contact, a sectional insulating-casing comprising a plurality of tubular sections, the adjacent meeting edges of said sections being tapered to engage each other, and intervengaging screw-thread connections between one of said insulating-sections and the contact-sleeve for clamping the several sections in position against the panel and surrounding the tubular contact.

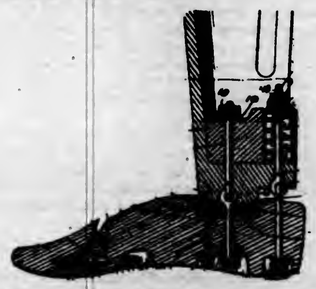
6. In combination with a panel or switchboard having circuit-conductors arranged upon its surface, and arranged in extension one with the other, an insulating-bushing intermediate the adjacent overlying ends of said circuit-terminals, a threaded sleeve-contact in engagement with one of said circuit-terminals and insulated from the other, a stud-contact having a screw-threaded engagement with the other of said circuit-terminals with an insulating-bushing interposed between it and the threaded sleeve-contact, said stud-contact serving to clamp the various parts in position, and an insulating-sleeve surrounding the threaded sleeve-contact and held in position upon the panel through interengagement with said threaded sleeve-contact.

7. In combination with a panel or switchboard provided with circuit-terminals, a pair of contact members removably secured to the base and connected respectively with said circuit-terminals and a sectional insulating-sleeve detachably secured upon the panel through interengagement of one of said sections with one of the contact members, the base-section of said tubular contact having openings through its side walls through which the panel-terminals extend.

809,874. **BUCKLE.** FRANK T. WHEELER, Wheatley, Ark. Filed May 26, 1905. Serial No. 262,604.

Claim.—A buckle comprising straight side pieces having their opposite ends bent upwardly in a similar manner and connected by cross-bars, said side pieces being provided with upwardly-extending lugs having openings therein, an intermediate cross-bar located adjacent the upwardly-extending lugs, and a thumb-lever pivotally mounted in the openings in the before-mentioned lugs and provided with a stud adapted to engage with the openings in a long line, the intermediate cross-bar performing the double function of holding the long line in engagement with the stud and of serving as an attaching means for a short line.

809,875. **ARTIFICIAL LIMB.** GEORGE B. WILKINS, Oshkosh, Wis. Filed June 14, 1904. Serial No. 213,182.



Claim.—1. An artificial limb, comprising a lower leg portion and a foot, and an ankle-joint connecting them, a heel-cord comprising bolt-sections one section of which is carried by the leg portion while the other section is rigidly secured in the heel, nuts holding the heel-section in place, a disk engaging the threads on the lower end of the lower bolt-section, the said disk being capable of adjustment to project beyond the lower face of the heel to different degrees for controlling the elevation of the heel in the shoe of the wearer.

2. An artificial limb comprising a leg-section and a foot, the said foot having a socket formed in its upper surface, an adjustable base-plate extending over the bottom of said recess, means for adjusting said plate to different angles in said socket a yielding seat covering said base-plate and within the socket, means for preventing the rotation of said seat within the socket, a beveled projection upon the end of the leg-section and resting upon the yielding seat, and means for connecting the leg-section with the foot, said means extending through the seat and base-plate.

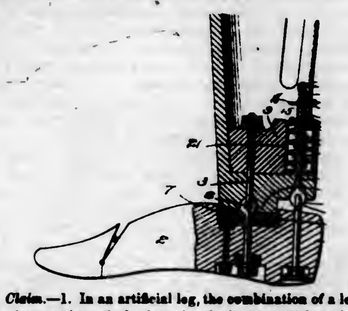
3. An artificial limb, comprising a leg-section, and foot, the said foot having a socket formed therein, a base-plate arranged in the bottom of the socket, means extending upwardly through the foot and engaging the base-plate from beneath for tipping it in the socket, a yielding seat within the socket and resting upon the base-plate, means carried by the yielding seat and engaging the socket for preventing the turning of the said yielding seat in the socket, a beveled projection upon the end of the leg-section and resting upon the said seat and a jointed bolt for holding the leg-section in position and permitting the leg-section to rock upon the said yielding seat.

4. An artificial limb, comprising a hollow leg-section and a foot, said foot having a leg-receiving socket formed therein, an extension formed upon the leg-section, having a beveled lower end, permitting a rocking movement of said leg-section in said socket, an ankle-bolt having upper and lower sections carried by the leg and foot respectively and provided with an articulating joint at the point of contact between the leg and foot, and a heel-bolt having sections carried by the leg and foot and having an articulating joint at the said point of movement at the ankle.

5. An artificial limb, comprising a leg-section and a foot-section, a hinged toe secured to the foot-section, a transversely-extending bearing projecting from the toe, a corresponding socket-bearing being formed across the end of the foot-section, bolts for drawing the bearings together and yet permitting of their movement with relation to each other and a transversely-arranged cushion or elastic pad the foot-section having a recess for receiving the said pad and holding the same beneath the axis of movement of the toe, the said pad extending the entire length of the bearings beneath the same.

6. An artificial leg, comprising a leg portion and a foot portion, a recess being formed in the said foot portion, a tapered yielding pad mounted in said recess, a tipping plate supporting the said pad, and means for holding the leg-section upon said pad.

809,876. **ARTIFICIAL LIMB.** GEORGE B. WILKINS, Oshkosh, Wis. Filed Jan. 26, 1905. Serial No. 243,126.



Claim.—1. In an artificial leg, the combination of a leg portion and a foot portion, of a heel-tension device, comprising a bolt, a tension-washer having its periphery extending beyond the walls of the leg portion, and means for locking the same in different positions.

2. A tension-controlling device for artificial legs, comprising a bolt, a compression-spring, an elongated washer mounted on the bolt and having at one end a spring-compressing portion, and at the other end a projecting hand-engaging portion by which the washer may be turned for adjustment, and means for holding the washer in its adjusted positions.

3. A tension-controlling device for artificial limbs, comprising a bolt for connecting the parts of the limb, a compression-spring carried by the bolt, a washer engaging threads upon the bolt and having a cylindrical body portion and end flanges, one flange engaging the spring for compressing it and the other flange forming an annular projection upon the washer by which it may be turned for adjustment.

4. An antirattling tension-adjusting device for artificial limbs, comprising a bolt, a tension-spring, a washer for compressing the spring and a cushioning material carried by the said washer and engaging surrounding parts of the artificial limb to prevent the rattling of the parts.

5. A tension-controlling device for the articulating joint of an artificial leg, comprising a bolt connecting the parts, a spring surrounding the bolt and fitting in a socket in one of the parts, the said bolt having threads upon its ends, an elongated washer mounted on the threaded bolt and projecting into the said socket at one end for maintaining a proper tension upon the spring, the other end of the washer projecting outside the socket and formed with roughened edges whereby it may be easily turned by hand.

6. A tension device for the joints of artificial limbs, comprising a tension-spring, a washer engaging the spring, a detent engaging the washer for holding it in its adjusted positions, and means for holding the detent normally in contact with the washer.

7. A tension-controlling device for the joints of artificial limbs, comprising a spring, a compressing-washer having an operating-flange, a locking-washer mounted adjacent to the flange and means carried thereby for gripping the edge of the flange on the compressing-washer.

8. A tension-controlling device for the joints of artificial limbs, comprising a tension-spring, a compressing-washer therefor, a locking-washer capable of engaging the tension-washer and holding it against turning, a spring for holding the locking-washer against the tension-washer and means for adjusting the tension of the said latter spring.

9. A tension-controlling device for the articulating joints of artificial limbs, comprising a spring, a tension-bolt passing through the

same having a threaded end, a herf or groove formed in the said bolt, a spring-compressing washer mounted upon the bolt, a locking-washer also mounted upon the bolt and having a detent engaging the groove in said bolt, and means carried by the said washer and capable of gripping the spring-compressing washer for preventing its turning upon the bolt.

10. A tension-controlling device for the joints of artifical limbs, comprising a coiled spring, a bolt passing through the same, having a threaded end and a groove formed therein, a washer for compressing the spring mounted upon the bolt, a locking-washer also mounted upon the bolt provided with an inwardly-extending detent or finger engaging the groove and a movable gripping-arm mounted upon the locking-washer and capable of engaging the spring-compressing washer for preventing its turning.

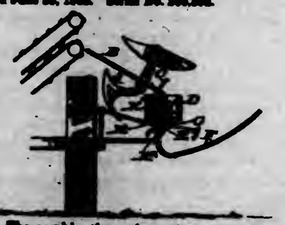
11. A tension device for the heel-bolt of an artificial leg, comprising a bolt, a tension-spring surrounding the same, a compressing-washer mounted on the said bolt and engaging the spring, the bolt being provided with an elongated groove, a locking-washer provided with means engaging said groove, a pivoted arm carried by the locking-washer and provided with gripping means for engaging the spring-compressing washer, the arm being also capable of being turned out of engagement with the compressing-washer when it is to be adjusted and means for actuating the locking-washer in engagement with the compressing-washer.

12. A tension device for the heels of artificial legs, comprising a jointed heel-bolt, the said leg being provided with a socket surrounding the same, a spring mounted in the socket and surrounding the bolt, an antirattling washer engaging the bolt, one end of the washer being provided with yielding packing material projecting from the periphery thereof, the packed end of such washer being made to just fit the bore of the recess in the leg, a projecting washer-operating flange having notches in its periphery by which it may be turned for adjusting the washer, and locking means mounted on the bolt and capable of engaging the said notches for preventing the turning of the spring-compressing washer.

13. A tension device for artificial-limb heel-bolts, comprising a bolt, a tension-spring surrounding the same, an elongated washer, the washer being formed with an elongated sleeve portion engaging the bolt, and annular flanges at each end thereof, a washer of yielding material secured to one of said flanges, one or more plates for holding the washer in position against said flange, and means engaging the other flange for preventing the turning of the compressing-washer upon the bolt after it has been adjusted.

14. A tension device for the heels of artificial legs, comprising a heel-bolt having a threaded and grooved end portion, a compression-spring surrounding the bolt, a washer engaging the spring, the said washer having end flanges separated upon the body portion of the washer, one of said washers engaging the spring while the other projects beyond the periphery of the leg, projections formed upon the said projecting flange, a locking-washer mounted upon the bolt having a detent engaging the groove therein, a spring-controlled arm carried by the locking-washer, a detent projecting from the arm and capable of engaging the projections on the flange of the compressing-washer, an adjusted collar mounted upon the bolt, and a spring interposed between the collar and the locking-washer for holding it normally against the spring-compressing washer.

809,877. **BINDER ATTACHMENT.** ALBERT WILLIAMS, Joliet, Mont. Filed June 30, 1905. Serial No. 268,892.



Claim.—1. The combination substantially as herein described of the binder-deck, the angle-bar extending beneath the lower edge thereof and having an upper horizontal wing, and a depending vertical wing, bundle-carrier fingers below the said angle-bar, the saddles or packing-blocks recessed in their lower edges to receive the horizontal wing of the angle-bar and extending laterally beyond the said angle-bar to form a broad rest or seat for the box, the box on said saddles, and the bolts extending upwardly through the saddles and the bottom of the box and secured within the latter and having their lower ends hooked to engage beneath the upright wing of the angle-bar, substantially as set forth.

2. The combination with the deck and the bundle-carrier fingers, of the angle-bar below the deck, the box above the angle-bar, and the bolts connected with the box and having a hooked engagement with the angle-bar, substantially as set forth.

3. The combination of the deck, the angle-bar below the deck, the saddles or packing-blocks recessed in their lower faces to fit the angle-bar, the box, and means for securing the box, saddles and angle-bar together, substantially as set forth.

4. In a seed-saving attachment for binders, the combination of the deck, a box, and saddles or packing-blocks adapted to fit below the box, and having their lower faces recessed to fit the finger-supporting bar and means for supporting such bar below the deck, substantially as set forth.

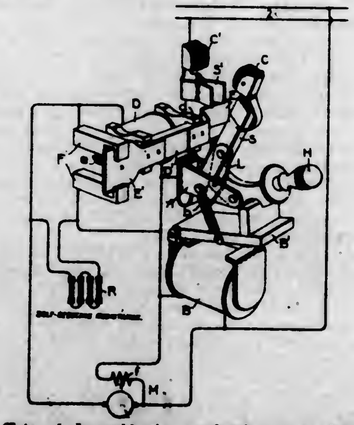
5. A seed-saving attachment for binders consisting in combination with the deck of the box below the deck, the saddles or packing-blocks fitted beneath the box and recessed in their lower faces and having vertical openings adjacent to said recess, the finger-supporting bar and the bolts for securing the saddles or packing-blocks, said bolts having their lower ends hooked into engagement with the finger-supporting bar, substantially as set forth.

6. The combination with the deck, of the angle-bar below the deck, the box between the angle-bar and deck and the bolts connected with the box and hooked at their lower ends into engagement with the angle-bar, substantially as set forth.

7. The combination in a harvester with the deck, the box below the deck, the saddles or packing-blocks extending transversely beneath the box and the harvester-frame having the angle-bar upon which said saddles or packing-blocks rest, of the bolts connected with the box and hooked at their lower ends into engagement with the angle-bar, substantially as set forth.

8. The combination of the deck, the angle-bar below the deck, the saddles or packing-blocks upon the angle-bar, the box upon the saddles and below the deck and the bolts extending upwardly through the saddles and the bottom of the packing-box and having their lower ends hooked for engagement with the angle-bar, substantially as set forth.

809,878. **STARTING DEVICE FOR ELECTRIC MOTORS.** HOWARD B. WILSON, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Mar. 10, 1904. Serial No. 197,484.



Claim.—1. In combination, an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, and automatic means for cutting said resistance out of circuit when its ohmic value is reduced to a predetermined amount.

2. In combination, an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, a switch-contact arranged to cut said resistance out of circuit, and automatic means for actuating said switch-contact when the potential drop in said resistance falls to a predetermined amount.

3. In combination, an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, a magnet-winding connected in a circuit in which the current varies when the ohmic value of said resistance changes, and a switch-contact controlled by said magnet-winding and arranged to cut said resistance out of circuit.

4. The combination of an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, a magnet-winding connected in a circuit in which the current decreases when the ohmic value of said resistance decreases, and a switch-contact controlled by said winding and arranged to cut said resistance out of circuit.

5. The combination of an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, a magnet-winding connected in shunt to said resistance, and a switch-contact controlled by said magnet-winding and arranged to short-circuit said resistance when the potential drop in said resistance falls to a predetermined value.

6. The combination of an electric motor, and means for starting the same comprising a self-reducing resistance connected in the motor-circuit, a switch-contact adapted to short-circuit said resistance, means tending to move said contact to short-circuit said resistance, and a magnet-winding connected in shunt to said resistance and adapted to restrain said switch-contact until the potential drop in said resistance falls to a predetermined value.

7. In a motor-starting device, a self-reducing resistance, a switch-contact arranged when moved to short-circuit said resistance, a switch adapted to close the motor-circuit and arranged to put a strain upon said contact, and a magnet connected in shunt to said resistance and adapted to restrain said contact until the potential drop in said resistance falls to a predetermined value.

8. In combination, an electric motor, and means for starting the same comprising a magnetite resistance connected in the motor-circuit, and automatic means for short-circuiting said resistance when the potential drop therein falls to a predetermined value.

9. In combination, an electric motor, and means for starting the same comprising a magnetite resistance connected in the motor-circuit, a switch-contact arranged to cut said resistance out of circuit, and automatic means for actuating said switch-contact when the resistance of said magnetite falls to a predetermined value.

10. A motor-starting device comprising a resistance body having a negative temperature coefficient, means for including it in circuit on starting, and automatic means for cutting it out after the motor has started.

11. A motor-starting device comprising a resistance unit of conducting-oxid, a switch, and means for cutting out the unit when it has been heated a determinate degree.

12. In a starting-switch for electric motors, a movable switch member adapted to establish when moved the running connections for the motor, a magnet-winding adapted to restrain said member at starting, and means independent of the speed of the motor for impressing an automatically-decreasing voltage on said magnet.

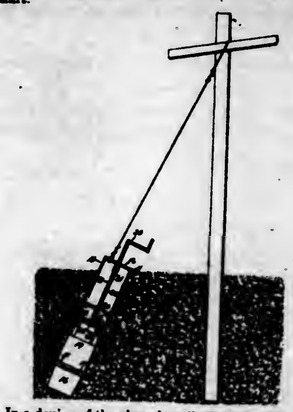
13. In a starting-switch for electric motors, a movable switch member adapted to establish when moved the running connections for the motor, a magnet-winding adapted to restrain said member at starting, and means independent of the speed of the motor for impressing an automatically-decreasing voltage on said magnet, said switch member being arranged to short-circuit said magnet when moved to running position.

809,879. **ANCHOR-POST.** RICHARD WELSH, Grand Junction, Iowa. Filed Jan. 30, 1905. Serial No. 243,893.

Claim.—1. In an anchor-post, a body portion, a shaft rotatably mounted in the body portion, arms pivotally mounted near the lower end of said shaft and capable of being moved from a position inside of the post to a position partially outside of the post as the shaft is rotated.

2. In a device of the class described, the combination of a body portion, a shaft mounted in the body portion and capable of vertical movement therein, arms pivotally mounted near the lower end of said shaft and connected therewith so arranged that as the shaft is moved in one direction the arms may be forced from a position inside of the post to a position partially outside of the post, and as the shaft is moved in the opposite direction, the arms may be withdrawn to a position inside of the post.

3. In a device of the class described, the combination of a body portion, a shaft rotatably mounted in the body portion and capable of vertical movement therein, arms pivotally mounted near the lower end of said shaft and connected therewith, so arranged that as the shaft is rotated in one direction the arms may be forced from a position inside of the post to a position partially outside of the post, and as the shaft is rotated in the opposite direction the arms may be withdrawn to a position inside of the post, and means for rotating said shaft.



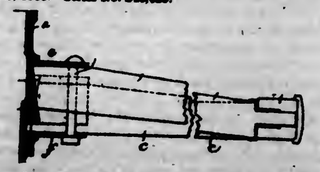
4. In a device of the class described, the combination of a body portion having a V-shaped lower end, two openings extending through the lower part of said body portion and adjacent to said V-shaped portion, a supporting-arm, an anchor-support extending across the interior of said body portion, having a screw-threaded opening therein, a screw-threaded shaft mounted in said anchor-support and designed to coact with the screw-threaded portion thereof, anchor-arms pivotally mounted near the lower end of said shaft and connected therewith designed to work in the openings in the lower end of said body portion as the shaft is rotated.

5. In a device of the class described, the combination of a body portion having a V-shaped lower end and two openings extending from the exterior to the interior of said body portion, anchor-arms designed to work in said openings mounted on the interior of said body portion, a screw-threaded shaft, means for supporting said screw-threaded shaft on the interior of said body portion, and means for rotatably and pivotally connecting the lower end of said shaft with said arms, for the purposes stated.

809,880. **FLEXIBLE COUPLING.** TOM A. WOOLLEDGE and ERNEST A. WARD, Birmingham, England. Filed Apr. 24, 1905. Serial No. 257,269.

Claim.—A flexible coupling comprising two closely-coiled members, one of said members terminating in a closely-coiled expansible shank having a portion of its length substantially conoidal in contour and the remaining portion cylindrical, said cylindrical portion of said shank adapted to extend in the other of said members so as to interlock therewith, thereby connecting the members together.

809,881. **VEHICLE-WHEEL.** WALTER WRIGHT, Glasgow, Scotland, assignor to S. Stevenson & Company, Glasgow, Scotland. Filed Feb. 20, 1905. Serial No. 246,020.



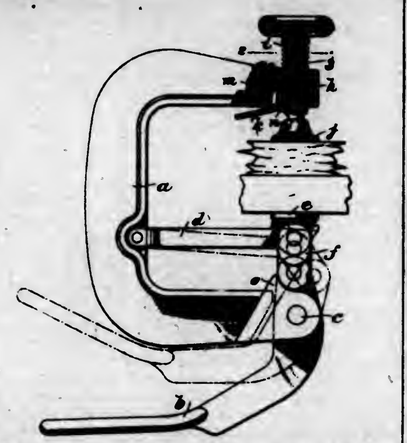
Claim.—In a wheel, the combination of a hub provided with a plurality of radial wedge-shaped pockets having inclined bottom surfaces, flanges surrounding the hub and forming the sides of said

pockets, a spoke in each of said pockets, each spoke having

the lower end of said spoke, a bushing-piece interposed

pockets, a spoke in each of said pockets, packing-pieces interposed alternately between the sides of the spokes and the flanges, and means for securing the flanges together.

809,883. CLAMP. JOHN WHEELEY, Philadelphia, Pa., assignor to Joseph B. Wrigley, Gettysville, N. J. Filed Aug. 31, 1905. Serial No. 276,659.



Claim.—1. In a clamp, the combination, with an adjustable clamping-jaw, of a second clamping-jaw, a pivoted lever carrying the second jaw, a handle-lever pivoted between its ends, and a link connecting one end of the handle-lever with the second clamping-jaw.

2. In a clamp, the combination with the yoke, of an adjusting-screw at one end thereof, a clamping-jaw movable by said screw, a lever pivoted to the yoke, a clamping-jaw carried by the lever, a toggle between the second jaw and the other end of the yoke, and means to operate the toggle.

3. In a clamp, the combination with the yoke, of an adjusting-screw at one end thereof, a clamping-jaw movable by said screw, a lever pivoted to the yoke, a clamping-jaw carried by said lever, a handle pivoted near its end to the other end of the yoke, and a link connecting the end of the handle with the clamping-jaw lever.

4. In a clamp, the combination with the yoke, of a clamping-jaw carried at one end of the yoke, a lever pivoted on the yoke, a second clamping-jaw carried by said lever, a handle pivoted on the other end of the yoke, and a link connecting the handle and the clamping-jaw lever.

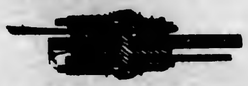
5. In a clamp, the combination, with the yoke, of a clamping-jaw carried at one end of the yoke, a second clamping-jaw, a handle pivoted near one end at the other end of the yoke, a link connecting the end of said handle and the second clamping-jaw, a pivoted lever connecting the second jaw and yoke, and a lug on the handle limiting the movement of the toggle.

6. In a clamp, the combination with the yoke, of an adjusting-screw at one end thereof, a clamping-jaw carried at the end of the screw, a spring-latch on the yoke adapted to engage a groove in the screw to hold the latter to its adjusted position, a second clamping-jaw, and means, connecting the second clamping-jaw with the yoke, adapted to move the second clamping-jaw toward the first clamping-jaw into a definite position with respect to the yoke.

7. In a clamp, the combination with the yoke, of an adjusting-screw at one end thereof, a clamping-jaw carried at the end of the screw, a spring-latch on the yoke adapted to engage a groove in the screw to hold the latter to its adjusted position, a lever pivoted on the yoke, a second clamping-jaw carried by said lever, a handle pivoted at the other end of the yoke, and a link connecting said handle and clamping-jaw lever.

8. In a clamp, the combination with the yoke of a threaded nut at one end thereof, an adjusting-screw, having longitudinal grooves, working in said nut, a clamping-jaw jointed to the end of said screw, a spring-latch extending into a slot in the nut, a projection on said latch adapted to engage either of said grooves, an arm on the latch extending without said slot whereby the latch may be operated to submit said projection, a lever pivoted to said yoke, a second clamping-jaw on the free end of said lever, a handle pivoted near one end to the other end of the yoke, a link connecting said clamping-jaw lever and handle end, and a lug on the yoke adapted to engage the joint between said link and handle when the latter is operated to move the second jaw to clamping position.

809,883. BUTTON. EMMEL ESCHBACHER, Scottdale, Pa. Filed Aug. 1, 1905. Serial No. 272,269.

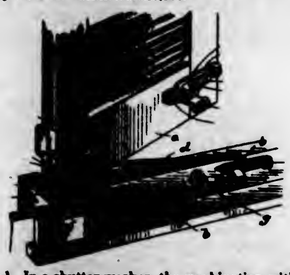


Claim.—1. In combination, a button-plate provided with oppositely-disposed shanks formed with heads, means for securing the button-plate to a garment, and spring-actuated locking members coöperating with the shanks and held in place by the heads.

2. In combination, a button-plate provided with oppositely-disposed shanks formed with heads, a holding-plate formed with prongs adapted to pass through a garment and engage the button-plate, a locking member formed with an opening and a spring-lock to engage one of the shanks, and a second locking member formed with an opening and a spring-lock to engage the other shank.

3. In a button, the combination with a button-plate provided with oppositely-disposed headed shanks, means securing the button-plate to a garment, a locking-plate formed with an opening and an adjacent spring-actuated lock which coöperates with one shank, and a second locking-plate formed with an opening and an adjacent spring-actuated lock which coöperates with the second shank.

809,884. SHUTTER BOWER AND FASTENER. IDA EISENBRAUN, CHARLES F. EISENBRAUN, and HARRY C. EISENBRAUN, Frederick, Md. Filed May 11, 1905. Serial No. 259,916.



Claim.—1. In a shutter-worker, the combination with a brace-rod having a pivotal end provided with a stud directed toward the other end of the rod, of a double-branch bracket having parallel arms connected at their ends by a bridge portion, and provided with apertures having offsets oblique toward the base of the bracket, substantially as specified.

2. In a shutter-worker, the combination with a bracket having separate arms provided with apertures having oblique offsets, of a pull-plate having a forward projecting lower end provided with a catch-hole having beveled front and rear edges, and a brace-rod having pivotal and distal arms, substantially as specified.

3. In a shutter-worker, a pull-plate having a middle attachment portion, a lower forward projecting portion having a bevel-edge catch-hole, and a forward and upward projecting pull portion having a wide elongated aperture, substantially as specified.

4. In a shutter-worker, the combination with a brace-rod having an integral downward-directed pivotal end provided with a stud near its lower end directed toward the other end of said rod, of a double-branch reversible bracket provided with bearings for said pivotal end having alined offsets directed toward the base of said bracket, said stud being normally out of line with said offsets and prevented from coming in line therewith by the interference of the shutter with the brace-rod, substantially as specified.

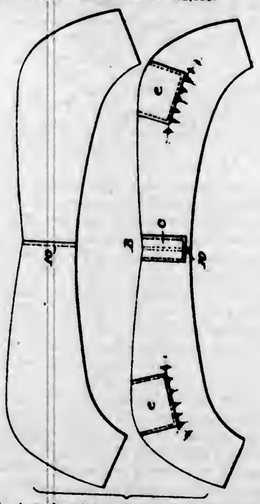
809,885. IMPACT-FUSE. LOUIS ARENDSOTH, Rittershaid, near Hasa-on-the-Ruhr, Germany, assignor to Fried. Krupp Aktiengesellschaft, Hasa-on-the-Ruhr, Germany. Filed May 26, 1905. Serial No. 262,493.

Claim.—1. In an impact-fuse, the combination with a longitudinally-movable primer-bolt, of centrifugally-operated securing means movable transversely of the bolt to release said bolt, and means projecting into the path of travel of said securing means and constructed to be moved out of the path of said securing means, when said securing means is moved by centrifugal force, to permit the securing means to unlock the primer-bolt, and to move again into the path of the securing means to prevent the said securing means again locking the primer-bolt.

2. The combination with the centrifugally-operated securing means of a fuse, of means moved by the securing means during its outward travel and adapted to enter the path of travel of the securing means after the passage of said securing means to prevent the return thereof.

3. The combination with the centrifugally-operated securing device of a fuse, of means projecting into the path of travel of the movable part of said securing device and holding said part in the secured position; said means being adapted to be displaced by the movable part of the securing device to permit the outward movement thereof and rebounding to secure said part in its outer position.

809,886. HORSE-COLLAR. CLARENCE L. ALLEN, Atlanta, Ga., assignor to Cotton Collar Company, Atlanta, Ga., a Corporation of Georgia. Filed Nov. 24, 1902. Serial No. 132,660.



Claim.—1. A casing for a horse-collar section consisting of a tube or bag of fabric having its edges connected by inside seams with a line of puckers at one side of the casing, and a line of stitches parallel to one edge of the casing and extending through said puckers and separating the casing into rim and body portions, substantially as set forth.

2. The combination in a horse-collar section, of a casing of textile fabric consisting of blanks with the edges meeting and sewed together at the inside and divided into hame and body portions by a line of stitching at the outside, substantially as set forth.

3. The combination in a horse-collar section, of a casing of textile fabric consisting of blanks with the edges meeting and sewed together by seams at the inside and divided into hame and body portions by a line of stitching at the outside, and with a line of puckers through which the said line of stitching extends, substantially as set forth.

4. A casing for a horse-collar consisting of two curved strips of fabric joined at the edges with the seams at the inside, one strip wider than the other and with a seam puckering a portion thereof, and the two strips connected by an outside row of stitches extending parallel to the folded edge of the wider strip and through the puckered portion, substantially as set forth.

5. A collar-casing consisting of two pieces of fabric of different widths, one having a series of puckers, the two connected together at the edges and by a line of stitches extending through the puckers, forming a main portion and a rim portion, substantially as set forth.

809,887. SELF-CENTERING DIVIDERS. CHRISTIAN ARNDT, Latrobe, Pa. Filed July 21, 1905. Serial No. 270,063.

Claim.—1. An instrument of the class described consisting of a head having a vertically-disposed opening formed therein, a pin slidably mounted in said opening, legs pivotally connected to said head, the upper ends of said legs having substantially segment-shaped gears adapted to mesh with one another, a segment-shaped bar having a contracted screw-threaded end passing through one of said legs, a knob screwing on said end and formed with a recess, a spring seating in said recess and surrounding said contracted end, said bar extending through the other of said legs, arms pivotally connected to said legs, a sleeve slidably mounted upon said pin and connected to said arms, springs mounted on said pin above and below said sleeve means to lock said segment-shaped bar in engagement with one of said legs, and means to lock said sleeve in engagement with said pin, substantially as described.

2. An instrument of the class described consisting of a head having a vertically-disposed opening formed therein, a pin slidably mounted in said opening, legs pivotally connected to said head, the upper ends of said legs having substantially segment-shaped gears meshing with one another, a segment-shaped bar connected to one of said legs and extending through the other of said legs, arms pivotally connected to said legs, means carried by said pin to limit the movement of the sleeve thereon a sleeve slidably mounted on said pin and connected to said arms, and means to lock said sleeve in engagement with said pin.

809,888. WHEEL FOR PLANTERS. GEORGE C. AVERY, Louisville, Ky., assignor to B. F. Avery & Sons, Louisville, Ky., a Corporation of Kentucky. Filed Nov. 17, 1905. Serial No. 287,894.

Claim.—1. A ground-wheel for planters, comprising a pair of radially-corrugated, interlocking sections, and means for securing said sections together.

2. A ground-wheel for planters, comprising interlocking, radially-corrugated sections, an axle extending through said sections, means for fixedly securing said sections and axle against independent, rotary movement, and means for securing said sections upon said axle.

3. A wheel for planters, comprising a pair of interlocking, concavo-convexed, radially-corrugated sections, and an axle extending through said sections.

4. A wheel for planters, comprising a pair of sections or disks, each section provided with a corrugated edge, and an axle connecting said sections.

5. A wheel, comprising an axle provided with a lug, a pair of sections carried by said axle, one of said sections provided with a

notch, said lug seated within said notch, the lug and notch constituting means for preventing independent rotary movement of said notched section and axle, and interlocking means formed upon the edges of said sections and adapted to prevent independent rotary movement of the same.

6. A wheel, comprising concave-convexed sections, each section provided with a corrugated edge, the edges of said sections interlocking, thereby preventing independent movement of said sections, an axle extending through said sections, and means formed upon said axle and one of said sections and being capable of preventing independent rotary movement of said axle and section.

7. A wheel, comprising dished sections, the sections in engagement at their outer edge, locking means formed upon the engaging faces of said sections and being capable of preventing independent movement thereof, a transverse member connecting said sections, and locking means formed upon said member and one of said sections and adapted to prevent independent, rotary movement of said section and member.

8. A wheel, comprising an axle, sections carried by said axle, the sections in engagement at their outer edge, locking means formed upon the engaging portions of said sections, and locking means formed upon said axle and one of said sections.

9. A wheel, comprising sections, the sections engaging at their outer edges, locking means formed upon the engaging portions of said sections, each section provided with a central aperture and a notch, an axle extending through the apertured portions of said sections, and a lug formed upon said axle and secured within the notch of one of the sections.

10. A wheel, comprising sections, corrugations formed upon each of said sections, an axle engaging said sections, and means for fixedly securing said sections to said axle.

11. A ground-wheel for planters, comprising dished or concave-convexed sections, said sections in engagement at their outer edge, a corrugation formed upon each of said sections, an axle engaging said sections, and means for fixedly securing said sections to said axle.

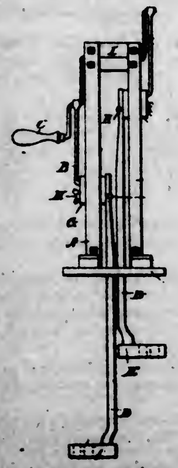
12. A wheel, comprising concave-convexed sections, said wheel provided with a roughened periphery, and means for locking said sections against independent, rotary movement.

13. A wheel, for planters, comprising a hollow body provided with outwardly-bulged or convexed sides, and radial corrugations formed upon one of said sides.

14. A wheel for planters, comprising a hollow body provided with outwardly-bulged or convexed corrugated sides.

15. A wheel for planters, comprising a hollow body provided with outwardly-bulged or convexed sides, and a roughened surface formed upon said body.

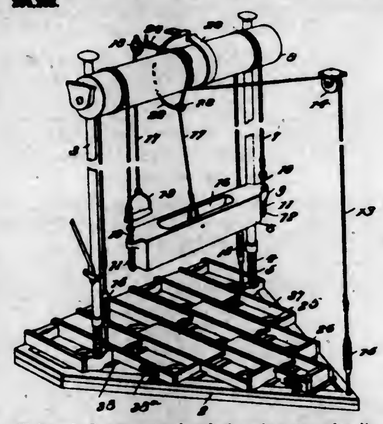
809,889. CHURN. DUE AYERS and JAMES D. SLOAN, Mount Vernon, Mo. Filed Aug. 17, 1905. Serial No. 274,622.



Claim.—1. The combination, with the dashers and vertically-movable dasher-rods, of the upright supports, the head-blocks between the upper ends thereof to which they are firmly bolted, the cranks on the outside of the uprights, provided with a straight part having its bearing in the said head-blocks, the dasher-rods vertically movable inside of the uprights, the pitmen connected to the cranks, and slide-blocks on the uprights through the intervention of which the pitmen are connected to the dasher-rods.

2. The combination, with the dashers and vertically-movable dasher-rods, of the upright supports, the head-blocks between the upper ends thereof to which they are firmly bolted, the cranks on the outside of the uprights, provided with a straight part having its bearing in the said head-blocks, the dasher-rods vertically movable inside of the uprights, the pitmen, each pivoted at its upper end to the crank, two-part slides adapted to move on the uprights—one part on the outside and the other part on the inside—a clamping-bolt connecting the two parts of each slide and securing the upper end of the dasher-rod to the inner part of the slide, the lower end of the pitman being pivoted to the outer part of the slide.

809,890. MEANS FOR SETTING AND SPOTTING TENPINS. JOHN C. BACKUS, Smithport, Pa. Filed Apr. 6, 1905. Serial No. 254,202.



Claim.—1. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a brake mechanism coöperating with said carrier for controlling its movements.

2. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a counterbalance for the carrier, and a brake for controlling the movements of the counterbalanced carrier.

3. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a counterbalance for the carrier, a coöperating brake, and means for simultaneously controlling the counterbalance and brake.

4. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a brake mechanism coöperating with the carrier, a counterbalance, and operating means for the counterbalance adapted to effect release of the brake mechanism when actuated to relieve the carrier wholly or in part of the influence of its counterbalance.

5. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a brake mechanism embodying an operating-lever, a counterbalance, and an operating-cord for said counterbalance adapted to positively actuate said operating-lever when drawn upon to overcome the force of the counterbalance wholly or in part so as to simultaneously effect release of the brake and permit free movement of the carrier.

6. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a brake mechanism comprising an operating-lever having a crank portion and a curved arm, a counterbalance for the carrier, and an operating-cord for the counterbalance having a portion deflected by the brake-operating lever and adapted to actuate the latter and effect release of the brake when said operating-cord is pulled upon.

7. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a brake mechanism coöperating with the carrier and comprising an operating-lever having a crank portion and a curved arm provided with an eye, a counterbalance, and an operating-cord connected with the counterbalance and passed through the eye of the brake-operating lever for actuating the latter simultaneously with the operation of the counterbalance.

8. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley to as to obviate obstruction thereof, a roller, a counterbalance, connecting means between the counterbalance, roller and carrier, a brake coöperating with said roller, and an operating-cord for simultaneously actuating the counterbalance and brake.

9. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a roller, a counterbalance, connections between the counterbalance, roller and carrier, a brake coöperating with said roller, a brake-operating lever, and an operating-cord connected with said counterbalance and passed around said roller and normally deflected between the roller and counterbalance by the brake-operating lever, said operating-cord when actuated serving to simultaneously release the brake and relieve the carrier wholly or in part of the influence of the counterbalance.

10. In apparatus for placing pins upon a bowling-alley and in combination with a carrier for receiving the pins and movable toward the bed of the alley to deposit the pins thereon and movable away from the bed of the alley so as to obviate obstruction thereof, a roller, a counterbalance, connections between the roller, counterbalance and carrier, a brake-band encircling the roller, a brake-operating lever having a crank portion in connection with one end of said brake-band and having its opposite end portion curved to extend around the roller, and an operating-cord connected to the counterbalance and normally deflected by said brake-operating lever and adapted to simultaneously release the brake and relieve the carrier wholly of the influence of its counterbalance

11. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides arranged about the pin-openings, a pin-shifter, and means for positively transmitting pressure from the pin-shifter to the pin-guides to effect separation or spreading of the latter.

12. In apparatus for setting pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the pin-openings for properly positioning the pins, a pin-shifter to effect delivery of the pins upon the alley, and means for transmitting pressure from the pin-shifter to the pin-guides loosely mounted in the carrier.

13. In apparatus for setting pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the pin-openings for properly positioning the pins, a pin-shifter to effect delivery of the pins upon the alley, and pressure-pins loosely mounted in the carrier and supported by the pin-guides and adapted to spread the latter when the pin-shifter is resting upon the carrier.

14. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the respective pin-openings, and spring connections forming the sole supporting means for the pin-guides and having positive attachment with the pin-guides and carrier and normally tending to yieldingly press coöperating pin-guides together for controlling and properly positioning the pins.

15. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the respective pin-openings, spring-arms attached to and projected from the pin-guides, and other arms having connection with the first-mentioned spring-arms and rigidly attached to the carrier.

16. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the respective pin-openings, spring-arms attached to and projected from the pin-guides, and other arms having connection with the first-mentioned spring-arms and rigidly attached to the carrier, the arms attached to the carrier having pendent portions embracing outer sides of the first-mentioned arms to prevent lateral displacement of the pin-guides.

17. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the respective pin-openings, spring-arms attached to and projected from the pin-guides, and other arms having connection with the first-mentioned spring-arms and rigidly attached to the carrier, the arms attached to the carrier having pendent portions embracing outer sides of the first-mentioned arms to prevent lateral displacement of the pin-guides, said pendent members being connected at their lower ends by means of a cross-bar which serves to limit the movement of the pin-guides.

18. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, pin-guides coöperating with the pin-openings to effect correct positioning of the pins, spring-arms 29 attached to the pin-guides, other arms 31 attached to the carrier, spring-coils connecting the arms 29 and 31, members 33 pendent from the arms 31 and embracing the arms 29, and a cross-bar 32 connecting the lower ends of the members 33, the several parts of the connections between the pin-guides and carrier being of integral formation.

19. In apparatus for setting the pins of bowling-alleys, the combination of a carrier provided with pin-openings, and coöperating pin-guides loosely connected with the carrier and movable into and out of contact with the pins, said pin-guides being concave upon their inner or engaging faces and having their ends inclined and in parallel planes, the concavity of each pin-guide being such with reference to the pins as to admit of the lower portion of a guide touching a side of the pin at a central point, and the upper portion touching a side of the pin at two points, the latter corresponding approximately to the intersection of the engaging face with opposite sides of the pin-guide.

20. In apparatus for setting pins of bowling-alleys, the combination of a carrier adapted to receive the pins and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, a pin-shifter mounted upon the carrier and adapted to receive a combined vertical and longitudinal movement, operating means pendent from the pin-shifter for actuating the latter as the carrier reaches the limit of its movement toward the plane of the alley preliminary to discharging the pins thereon, said operating means consisting of a block, a telescopic guide connection between said block and carrier, and an operating-bar between the pin-shifter and block.

21. In apparatus for setting pins of bowling-alleys, the combination of a carrier adapted to receive the pins and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, a pin-shifter mounted upon the carrier and adapted to receive a combined vertical and longitudinal movement, operating means pendent from the pin-shifter for actuating the latter as the carrier reaches the limit of its movement toward the plane of the alley preliminary to discharging the pins thereon, said operating means consisting of a block, a telescopic guide connection between said block and carrier, and an operating-bar between the pin-shifter and block, and jointed to each to admit of said bar having a swinging movement.

22. In apparatus for setting pins of bowling-alleys, the combination of a carrier adapted to receive the pins and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, a pin-shifter mounted upon the carrier and adapted to receive a combined vertical and longitudinal movement, operating means pendent from the pin-shifter for actuating the latter as the carrier reaches the limit of its movement toward the plane of the alley preliminary to discharging the pins thereon, said operating means consisting of a block, a telescopic guide connection between said shifter and block, said operating-bar having pivotal connection with the pin-shifter and link connection with said block and adapted to rock upon the latter.

23. In apparatus for setting pins upon bowling-alleys, the combination of a carrier provided with pin-openings and movable toward and from the plane of the alley to deposit the pins thereon and

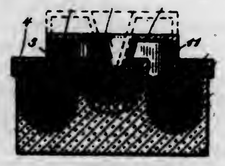
admit of its unobstructed use, and reducers for each of said pin-openings to admit of adapting the apparatus for different sizes of pins.

24. In apparatus for setting pins upon bowling-alleys, the combination of a carrier provided with pin-openings and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, and reducers for each of said pin-openings to admit of adapting the apparatus for different sizes of pins, said reducer having pendent pin-guides.

25. In apparatus for setting pins upon bowling-alleys, the combination of a carrier provided with pin-openings and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, and reducers for each of said pin-openings to admit of adapting the apparatus for different sizes of pins, said reducer having pendent guides and a vertical abutment or stop.

26. In apparatus for setting pins upon bowling-alleys, the combination of a carrier provided with pin-openings and movable toward and from the plane of the alley to deposit the pins thereon and admit of its unobstructed use, and reducers for each of said pin-openings to admit of adapting the apparatus for different sizes of pins, said reducer having pendent spaced pin-guides and a vertical abutment or stop.

809,891. **INK-WELL.** STEPHEN G. BALDWIN, Marion, Ind. Filed Mar. 30, 1905. Serial No. 253,226.



Claim.—1. An ink-well comprising a chamber to receive a yielding mass, and an ink-receptacle, a cover having a pen-opening extending down into said ink-receptacle, and a portion thereof extending within said yielding mass, said yielding mass being of such character as to support the said cover at any desired height, said cover being constructed to compress the air under the same and force the ink up into said pen-opening and hold the ink up in said pen-opening, substantially as described.

2. An ink-well comprising a chamber to receive a sealing material and an ink-receptacle, a cover having a pen-opening extending into said ink-receptacle, and a portion thereof extending into said sealing material, said cover being held within said sealing material at any desired height to compress the air under said cover to force the ink up into said pen-opening and to hold the ink up in said pen-opening, substantially as described.

809,893. **VIOLET DYE AND PROCESS OF MAKING SAME.** OSCAR BALLY and MAX H. ISLER, Mannheim, Germany, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany, a Corporation. Filed Jan. 21, 1905. Serial No. 242,571.

Claim.—1. The process for the production of anthracene coloring-matters by treating with caustic alkali a hereinbefore-defined benzanthrone compound.

2. The process for the production of anthracene coloring-matters by treating with caustic alkali a hereinbefore-defined benzanthrone compound, obtainable by condensing together a beta-amido-anthraquinon body and glycerin.

3. The process for the production of anthracene coloring-matters by treating with caustic alkali a hereinbefore-defined benzanthrone compound, obtainable by condensing together beta-amido-anthraquinon and glycerin.

4. As new articles of manufacture, the anthracene coloring-matters which can be obtained by treating with caustic alkali a benzanthrone, which coloring-matters dissolve in concentrated sulfuric acid yielding from green to violet solutions, and which dissolve in alkaline hydrosulfite yielding from blue to reddish-brown vats which dye vegetable fiber substantively giving red-blue to green-blue shades.

5. As new articles of manufacture, the anthracene coloring-matters which can be obtained by treating with caustic alkali a benzanthrone obtainable by condensing together a beta-amido-anthraquinon body and glycerin, which coloring-matters dissolve in concentrated sulfuric acid yielding from green to blue solutions, and which dissolve in alkaline hydrosulfite yielding blue vats which dye vegetable fiber substantially giving violet shades.

6. As a new article of manufacture, the anthracene coloring-matter which can be obtained by treating with caustic alkali the benzanthrone obtainable by condensing together beta-amido-anthraquinon and glycerin, which coloring-matter dissolves in concentrated sulfuric acid yielding a blue solution and which dissolves in alkaline hydrosulfite yielding a blue vat, which dyes vegetable fiber substantially giving violet shades.

809,893. **ANTHRACENE COMPOUND AND PROCESS OF MAKING SAME.** OSCAR BALLY, Mannheim, and HUGO WOLFF, Ludwigshafen-on-the-Rhine, Germany, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany, a Corporation. Filed Oct. 10, 1905. Serial No. 282,184.

Claim.—1. The process for the production of anthracene compounds by condensing a hereinbefore-defined alpha-amidoanthraquinon body with glycerin.

2. The process for the production of anthracene compounds by condensing a hereinbefore-defined alpha-amidoanthraquinon body with glycerin in the presence of sulfuric acid.

3. The process for the production of anthracene compound by condensing alpha-amidoanthraquinon with glycerin in the presence of sulfuric acid.

4. As new articles of manufacture the anthracene compounds obtainable by condensing a hereinbefore-defined alpha-amidoanthraquinon body with glycerin, which compounds contain a benzanthrone grouping and which, when dry, consist of brown powders which are soluble in concentrated sulfuric acid yielding yellow to brown solutions with green fluorescence and which on melting with caustic alkali yield violet-blue coloring-matters.

5. As a new article of manufacture the anthracene compound obtainable by condensing alpha-amidoanthraquinon with glycerin, which compound contains a benzanthrone grouping and which, when dry, consists of a brown powder which is soluble in concentrated sulfuric acid yielding a yellowish-brown solution with a green fluorescence and which on melting with caustic alkali yields a violet-blue coloring-matter.

809,894. **ANTHRACENE COMPOUND AND PROCESS OF MAKING SAME.** OSCAR BALLY, Mannheim, and HUGO WOLFF, Ludwigshafen-on-the-Rhine, Germany, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany, a Corporation. Filed Oct. 11, 1905. Serial No. 282,260.

Claim.—1. The process for the production of anthracene compounds by condensing a hereinbefore-defined halogen anthracene body with glycerin.

2. The process for the production of anthracene compounds by condensing a hereinbefore-defined halogen anthracene body with glycerin in the presence of sulfuric acid.

3. The process for the production of anthracene compounds by condensing beta-chlor-anthraquinon with glycerin in the presence of sulfuric acid.

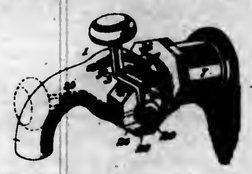
4. As new articles of manufacture the anthracene compounds obtainable by condensing a hereinbefore-defined halogen anthracene body with glycerin, which compounds contain a benzanthrone grouping and also contain halogen, and which, when dry, consists of from green to yellow powders, which are soluble in concentrated sulfuric acid yielding reddish-brown to reddish-yellow fluorescent solutions, and which on melting with caustic alkali yield coloring-matters which from an alkali hydrosulfite vat dye vegetable fiber substantively.

5. As a new article of manufacture the anthracene compound obtainable by condensing beta-chlor-anthraquinon with glycerin, which compound contains a benzanthrone grouping and also contains chlorin and which, when dry, consists of a green powder which is soluble in concentrated sulfuric acid yielding a reddish-brown solution with a yellowish-brown fluorescence and which on melting with caustic alkali yields a blue-violet coloring-matter which from an alkaline hydrosulfite vat dyes vegetable fiber substantively.

809,895. **FAUCET.** JOSEPH G. BRADLEY, Baltimore, Md. Continuation of application Serial No. 178,103, filed Sept. 20, 1903. This application filed Mar. 30, 1905. Serial No. 253,911.

Claim.—1. In a device of the class described, the combination of a body having a valve-seat, a valve arranged to engage the seat at the pressure side thereof, a horizontal shaft mounted on the body at

the opposite side of the valve-seat and connected with the valve, an upwardly-extending weighted arm connected with the shaft at one end and arranged at an inclination when the valve is open, whereby it is adapted to close the valve automatically, and stops arranged on the body in the path of the arm for limiting the movement thereof in opening and closing.



2. In a device of the class described, the combination of a body having a seat, a valve arranged to engage the seat at the pressure side thereof, a horizontal shaft mounted on the body at the opposite side of the valve-seat and connected with the valve, a weighted arm connected with the shaft and arranged to swing upwardly to open the valve and movable downwardly automatically by its own weight to close the same, the extent of movement of the valve corresponding with the movement of the weighted arm, whereby the valve will be properly seated when the arm is at the limit of its downward movement, and stops for limiting the movement of the weighted arm in opening and closing the valve.

809,896. **LIQUID-SOAP HOLDER.** EDWARD A. BENNER, Philadelphia, Pa. Filed Sept. 21, 1904. Renewed Dec. 6, 1905. Serial No. 290,607.

Claim.—A soap-holder consisting of a body having a discharge-nozzle at bottom, a valve for said nozzle, an elbow-shaped lever carrying said valve, a spring pressing said lever for causing the closing of said valve and means on the holder forming the bearing for said lever and means on the holder forming the connection of said spring, the outer limb of said lever projecting outwardly and downwardly from the angle of the lever and forming a guard for said spring.

809,897. **BURIAL-VAULT.** JOSEPH P. BENNING, Otway, Ohio. Filed Apr. 17, 1905. Serial No. 255,669.

Claim.—In a burial-vault, the combination with the base formed of layers of concrete, and metal interposed between the concrete, one of said layers having a groove therein; of a metal hood, oppositely-extending channeled portions at the edges of the hood and adapted to be seated within the groove, concrete layers upon opposite faces of the hood and supported by the channeled portions.

809,898. **PUZZLE.** JOHN BERGAN, Pittsburg, Pa. Filed Apr. 20, 1904. Serial No. 204,022.

Claim.—1. A puzzle having a channel, in combination with two or more movable objects adapted to traverse the same, said channel having a chasm in its bottom in which one of said objects may lodge so as to enable the other object or objects to pass over it, said channel being of sufficient depth at each point to retain said object or objects therein during each passage.

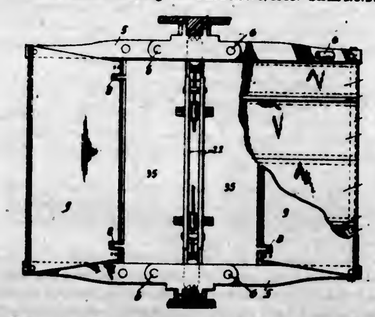
2. A puzzle having a circuitous covered channel, in combination with two or more movable objects adapted to traverse the same, said channel being of a width and of a depth less than that of two of said objects and having a chasm in its bottom in which one of said objects may lodge so as to enable the other object or objects to pass over it.

3. In a puzzle, a base-piece provided with a circuitous channel, a cover for said channel, two or more balls distinguishable from each other adapted to traverse the channel, said channel being of a width and of a depth less than the diameter of two balls, and having a chasm in which one of said balls may lodge so as to enable the other ball or balls to pass over it.

4. A puzzle having a circuitous channel provided with corrugated portions and a series of chasms in its bottom.

5. A puzzle having a circuitous covered channel, a series of balls distinguishable from each other and adapted to traverse the channel, said channel being of a width and of a depth less than the diameter of two balls and having corrugated portions and a series of chasms in its bottom, one only of said chasms being of sufficient depth to accommodate one of the balls in such manner that the other ball or balls may pass over it.

809,899. **CAGE FOR MINE AND ELEVATOR SHAFTS.** WILLIAM BLACK, Rices Landing, Pa. Filed Feb. 6, 1905. Serial No. 244,451.



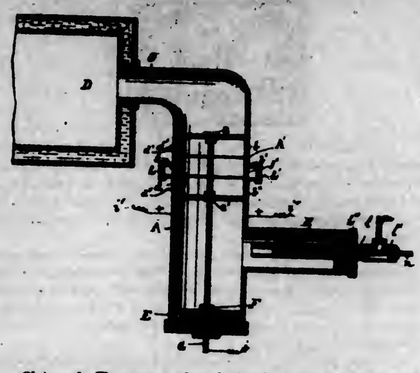
Claim.—1. A cage of the type described comprising sills, flooring supported by said sills, said flooring consisting of channel-shaped plates and braces extending through the depending edges of said plates, through said sills a track supported on said flooring, bolsters from which the sills are supported and vertical and oblique braces connecting said bolsters with said sills.

2. A cage of the type described, consisting of parallel sills, transverse braces securing said sills together, a floor composed of channel-shaped plates, said braces extending through said plates, tracks mounted on said floor, bolsters arranged above the sills, vertical braces connecting said bolsters to said sills, transverse braces connecting said bolsters together, and plates hinged to said last-named transverse braces and constituting the roof of the cage.

3. A cage of the type described, comprising metallic sills, transverse braces connecting said sills, a metallic flooring mounted on said braces, metallic bolsters, vertical braces, angularly-disposed braces connecting said sills with said bolsters, transverse braces connecting said bolsters together and plates hinged to said last-named braces and constituting the top of the cage.

4. The combination in an elevator-cage of sills, channel-shaped plates arranged between said sills having depending flanges, braces extending between and passing through the sills and passing through the depending flanges of said channel-plates, and tracks arranged between said channel-plates, said braces extending through said tracks.

809,900. PROCESS OF MAKING KETONES. HENRY S. BLAIR-SMITH, Mount Vernon, N. Y. Original application filed July 27, 1903, Serial No. 167,627. Divided and this application filed May 9, 1905. Serial No. 259,621.



Claim.—1. The process of producing ketones which consists in exposing carbon acid in a volatile or gaseous state to the action of hydrocarbon and heat.

2. The process of producing ketones which consists in performing a reaction between a carbon acid and hydrocarbon at a temperature below the dissociating-point of the ketone produced.

3. The process of producing ketones which consists in conveying a carbon acid and hydrocarbon in contact with a heated surface and collecting and condensing the product.

4. The process of producing ketones which consists in performing a reaction between a carbon acid and a hydrocarbon and removing excess of heat during transformation.

5. The process of producing ketones which consists in inducing a reaction between a carbon acid and hydrocarbon and abstracting the excess heat therefrom thus preventing elevation of temperature above the dissociating-point of the product desired.

6. The process of producing acetone which consists in exposing acetic acid to the action of methane and heat.

7. The process of making ketones which consists in oxidizing hydrocarbon by the action of a carbon acid while maintaining the temperature below the dissociating-point of the ketone by refrigeration.

8. The process of making ketones which consists in heating a composition containing a carbon acid and hydrocarbon until the hydrocarbon becomes oxidized and abstracting the excess of heat evolved during reaction by refrigeration.

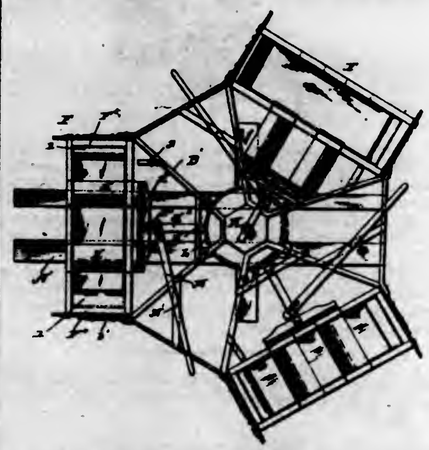
9. The process of making ketones which consists in heating a composition containing a carbon acid and hydrocarbon to a temperature at which a part of the oxygen content of the acid has an affinity for the hydrogen of the hydrocarbon to the exclusion of carbon and maintaining the reaction while regulating the temperature by refrigeration.

10. The process of making ketones, which consists in exposing a substance capable of yielding a carbon oxy-acid anhydrid to the action of heat, to the action of hydrocarbon and heat.

11. The process of making ketones, which consists in exposing a substance capable of yielding carbonic anhydrid (CO_2) by the action of heat, to the action of hydrocarbon and heat.

809,901. CONCRETE-BLOCK MACHINE. JOHN A. BLAKE and JAY KENNEDY, Wabash, Ind. Filed Apr. 3, 1905. Serial No. 253,204.

Claim.—1. A machine for pressing concrete blocks, comprising a base having its beams extended at one end, an upright mounted on each extension, a strut-bar between said uprights and the base and provided with box-loops forming guides for the presser-bars, loops on the base in line with those on the strut-bar, the presser-heads operating one above the other and having their carrier-bars movable longitudinally in the aligned loops of the base and strut-bar, a rocker between said carrier-bars, links connecting said rocker with the carrier-bars, a handle for operating the rocker, a revolving carrier comprising a block having a base portion, top beams, a central block from which said top beams diverge, the mold-boxes carried by said top beams and comprising the base-frames, the inner and outer sections hinged at their lower edges and having openings for the core-blocks, the end sections hinged to the side sections, lock devices for holding the box closed, the boxes being movable successively by the turning of the carrier into register with the press-heads, the core-blocks, the slide-bars connected with said blocks, means for operating the blocks, a plate on the base, ball-bearings between said plate and the base of the carrier-shaft and a tie-rod holding said shaft to the base-plate, substantially as and for the purposes set forth.



2. In a machine substantially as described the combination with a revolving carrier having a series of mold-boxes and upper and lower press-heads between which the mold-boxes may be successively presented by the revolution of the carrier, of means for operating the opposite press-heads simultaneously and reciprocally whereby the object may be pressed without being moved out of its plane of movement, core-blocks movable transversely through their respective mold-boxes and means in connection with the revolving carrier for operating the irrespective core-blocks, substantially as set forth.

3. The combination of a main frame and series of mold-boxes having hinged sides and ends, a carrier revolving on the main frame and supporting the series of mold-boxes, upper and lower press-heads between which the mold-boxes may be successively presented core-blocks movable through the hinged sides of their respective boxes and means for operating the press-heads reciprocally, substantially as set forth.

4. The combination with pressing devices and a revolving carrier having a circular series of mold-boxes, of core-blocks movable transversely through their respective mold-boxes and individual operating devices for the several core-blocks, such devices and core-blocks being movable with their respective mold-boxes, substantially as set forth.

5. The combination with the press-box and its movable bottom plate, of the press-head arranged to operate said bottom plate, a pallet or platen arranged to be lifted by the bottom plate and means for supporting each pallet or platen when raised, substantially as set forth.

6. The combination in an apparatus, substantially as described, of pressing devices, a revolving carrier having a series of mold-boxes arranged to be presented successively to the pressing devices, core-blocks movable transversely across their respective mold-boxes and means supported by the carrier for operating their respective core-blocks, substantially as set forth.

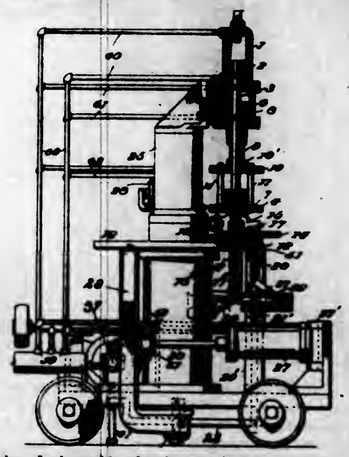
7. In an apparatus substantially as described, a press-box having a movable bottom plate arranged for operation by the press-head, pivoted dogs engaged by said bottom plate and a pallet or platen arranged to be lifted by the bottom plate and supported in raised position by the dogs.

8. In an apparatus, substantially as described, a revolving carrier, a series of mold-boxes thereon, core-blocks for each of said boxes and means supported adjacent to the boxes for operating their respective core-blocks, substantially as set forth.

9. The combination in an apparatus, substantially as described of the upper and lower pressing devices, the press-boxes having a movable bottom plate arranged for operation by the lower pressing devices, a pallet or platen arranged to be lifted by the bottom plate, and dogs arranged for engagement by said bottom plate and adapted to support the pallet or platen in raised position, substantially as set forth.

10. The combination in an apparatus substantially as described, of a main frame having a base portion and an upright thereon, a strut-bar extending between the base and upright and provided with loops forming guides for the carrier-bars of the press-heads, loops on the base in alinement with those on the strut-bar, the press-heads having their carrier-bars movable in the aligned loops, means for operating said press-heads reciprocally, the mold-boxes and a movable carrier for same, substantially as set forth.

809,902. MACHINE FOR THE MANUFACTURE OF GLASSWARE. CHARLES H. BLUE, Wheeling, W. Va. Filed Mar. 30, 1903. Serial No. 149,785.



Claim.—1. A machine for the manufacture of glassware, including a movable mold-carrier, a plurality of mold-sections carried thereby, a vertically-movable press-bottom for each mold, a blow-bottom for each mold-section, means for moving the press-bottom up into operative position while the carrier is moving, and means for dropping the press-bottom while the carrier is stationary at the pressing-point.

2. A machine for the manufacture of glassware, including a movable mold-carrier, a plurality of mold-sections carried thereby, a vertically-movable bottom for each mold, means for moving the bottom into operative position while the mold-carrier is moving and means for depressing the bottom out of operative position while the carrier is stationary at the pressing-point.

3. A machine for the manufacture of glassware, including an intermittently-movable mold-carrier, a plurality of mold-sections carried thereby, a vertically-movable bottom for said mold-sections, a movable plunger and a movable plunger-ring for said mold-sections, and a continuously-rotating shaft provided with counting means controlling the movements of said movable members.

4. A machine for the manufacture of glassware, including an intermittently-movable mold-carrier, a plurality of mold-sections carried by the mold-carrier, a member for moving the carrier intermittently, movable bottoms for said mold-sections, a movable plunger and a movable plunger-ring coacting with said mold-sections, pressure-cylinders operatively connected with the carrier movable member the plunger and the plunger-ring, valves controlling the pressure to said cylinders, and a continuously-rotating shaft controlling said valves.

5. A machine for the manufacture of glassware including a movable mold-carrier, a mold carried thereby, a vertically-movable bottom for said mold, means for elevating the bottom while the carrier is moving, a movable support for said bottom when it is elevated, and means for moving said support to depress said bottom while the mold-carrier is stationary.

6. A machine for the manufacture of glassware, including a movable mold-carrier, a mold carried thereby, a vertically-movable bottom for said mold, means for elevating the press-bottom to operative position, a laterally-movable support for said bottom when elevated, and means for moving the support laterally and permitting the bottom to drop.

7. A machine for the manufacture of glassware, including a movable mold-carrier, a mold carried thereby, a vertically-movable press-bottom for said mold, a blow-bottom therefor, an incline adapted to move the press-bottom into operation during the movement of the said carrier, and means for dropping said press-bottom after the pressing operation.

8. A machine for the manufacture of glassware, including a movable mold-carrier, a mold carried thereby, a vertically-movable press-bottom for said mold, a blow-bottom therefor, an incline adapted to move the press-bottom into operative position by the movement of said carrier, a movable support at the upper end of the incline for said press-bottom, and means for moving said support and causing said press-bottom to drop after the pressing operation.

9. A machine for the manufacture of glassware, including an intermittently-movable mold-carrier, a plurality of molds carried thereby, a pressure-actuated mechanism moving said mold-carrier, a pressure-actuated vertically-movable plunger and blow-head, a vertically and a horizontally movable bottom for said molds actuated in sequence by the movement of said mold-carrier, valves for the said pressure-actuated mechanism, and a member controlling said valves in relative sequence to the said coöperating mechanism as described.

10. A machine for the manufacture of glassware, including an intermittently-movable mold-carrier, a plurality of molds carried thereby, a pressure-actuated mechanism moving said mold-carrier, pressure-actuated press and blow mechanisms a lock for the said mold-carriers when at rest, valves controlling the pressure for said pressure-actuated mechanism, and means controlling the valves in sequence as described and actuating the lock to release the carrier after the operation of the pressing and blowing and in advance of the movement of the carrier.

11. A machine for the manufacture of glassware, including an intermittently-movable mold-carrier, a plurality of molds carried thereby, a plunger adapted to coact with said molds, mechanisms for actuating the carrier and the plunger, a movable bottom actuated by the movement of the carrier, and a controlling member directly controlling the movement of the carrier and the plunger, and through the movement of the carrier controlling the movement of the bottom.

809,903. DREDGER-SLEEVE. WILLIAM F. BOWERS, San Francisco, Cal. Filed Apr. 28, 1905. Serial No. 257,286.

Claim.—A flexible pipe connection comprising two cylindrical rubber portions adapted to fit the pipe-sections to be connected and a single rubber bulbous enlargement intermediate of said cylindrical portions and integral therewith, substantially as described.

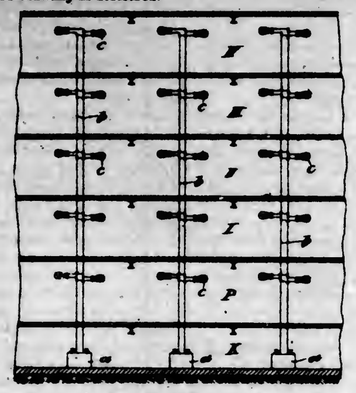
809,904. EMERGENCY ELECTRIC-LIGHTING ARRANGEMENT FOR THEATERS AND SIMILAR BUILDINGS. FRITZ BEARS, Berlin, Germany. Filed Mar. 21, 1905. Serial No. 251,267.

Claim.—1. An electric emergency-lighting system for buildings, consisting of several sources of energy located in the basement of a building, a plurality of circuits extending therefrom from floor to floor throughout the building, said circuits being removed from and being independent of each other throughout their length, and lamps connected in said circuits in the respective stages or floors of the building, substantially as described.

2. An electric emergency-lighting system for buildings, consisting of several sources of energy located in the basement of a building, a plurality of circuits extending therefrom in vertical lines from floor to floor throughout the building, said vertical circuits being removed from and being independent of each other throughout their vertical length, and lamps connected in said circuits in the respective stages or floors of the building, substantially as described.

3. An electric emergency-lighting system for buildings, consisting of several sources of energy located in the basement of a building, a plurality of circuits extending therefrom from floor to floor throughout the building, said circuits being removed from and be-

ing independent of each other throughout their length, and double lamps connected in said circuits in the respective floors of the building, substantially as described.



809,905. OVERSHOE-FASTENER. WATSON O. BROOKWAY, Threeoaks, Mich. Filed June 19, 1905. Serial No. 265,982.

Claim.—1. The herein-described clamp having means to attach it to a shoe and comprising the stationary jaw member 4 having the offset portion at its center, the swinging jaw member having its inner end pivotally connected to the offset portion of the stationary jaw member, and the spring-plate 10 pivotally connected to the upper end of the stationary jaw member for lateral movement to enable the free end of the spring-plate to bear on the free end of the swinging jaw member, to press the latter toward the stationary jaw member, or to be disengaged from the said swinging jaw member.

2. The herein-described clamp comprising a socket member for attachment to a shoe, a resilient head for engagement with the socket member, a pivot projecting outwardly from said head, the stationary jaw member secured on the pivot and having the offset portion at its center, the swinging jaw member having its inner end pivotally connected to the offset portion of the stationary jaw member, and the spring-plate mounted on the pivot for lateral movement with reference to the stationary jaw member, to engage and disengage the swinging jaw member.

809,906. FENCE. JAMES H. BROWN, St. Charles, Ill., assignor of one-half to Harry D. Kirk, Chicago, Ill. Filed Dec. 18, 1904. Serial No. 237,551.

Claim.—In combination, a fence-post of rectangular cross-section having its sides converging toward the top and a recess in one of its faces; a strip for the fastening of fence-wires, adapted to fit the recess in said post whereby the position of the strip in the post is predetermined; and a plurality of separate hoops of different sizes adapted to encircle said post and strip and come to a tight bearing independently of each other and independently of the elevation of the strip in the post, and said strip when seated projecting in front of the surface of the post whereby the hoops when forced downward relatively to the strip force the strip inward toward the post notwithstanding the rectangular cross-section of the latter.

809,907. METAL CAR-ROOF. JOHN C. CAMPBELL, Chicago, Ill. Filed May 26, 1904. Serial No. 209,149.

Claim.—1. A car-roof comprising roof-sheets having their ends [illegible] with inverted eave-flanges, the eave portion of one at least of said sheets being provided with a laterally-extending portion overlapping the joint between adjoining sheets, and retaining-plates engaging the inverted eave-flanges of the roof-sheets.

2. A car-roof comprising roof-sheets having their ends formed with downwardly-extending U-shaped eave-flanges, the inner portions of said eave-flanges being shorter than the outer portions thereof, said outer portions being arranged to overlap, and retaining plates or strips engaging the U-shaped eave-flanges of said roof-sheets.

3. A car-roof comprising roof-sheets having their edges formed with interlocking flanges and having their ends formed with U-shaped eave-flanges, the inner portions of said eave-flanges being arranged to abut and the outer portions of said eave-flanges being arranged to overlap, in combination with retaining plates or strips having flanges interlocking with the eave-flanges of the roof-sheets.

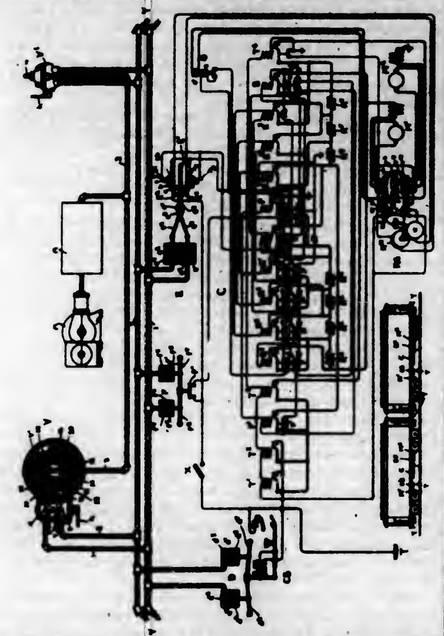
4. A metal car-roof comprising roof-sheets extending transversely of the car and having flanged interlocking edges, the edges of the sheets being formed at their centers with cut-away spaces and with upturned flanges about said spaces in combination with saddle-blocks and retaining-bolts for holding said sheets in position.

5. A car-roof, comprising metal sheets extending transversely of the car and having their outer ends reverted to form U-shaped bends at the eaves of the roof, in combination with metal retaining-plates secured to the car and extending lengthwise thereof, the free edges of said retaining-plates being rebent to form flanges that set within the U-shaped eave-flanges of the roof-sheets, the said U-shaped flanges of the roof-sheets and the rebent flanges of the retaining-plates being spaced both laterally and edgewise of the latter to permit universal play between the roof-sheets and the car, said roof-sheets being unsecured to the car-roof other than substantially at the ridge, by said flanges, and at the ends of the car.

809,908. SYSTEM OF CONTROL. FRANK B. CARR, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Oct. 1, 1904. Serial No. 226,705.

Claim.—1. In a system of train control, in combination with motor-controllers including means for determining the direction of rotation of the motors upon one or more cars, of controller-actuating means including a source of power local to each car, and a pneumatic train system for governing the action of the controller-actuating means, said train system being operative to give proper motor connections upon the reversal of one or more cars of a train.

2. In a system of train control, in combination with motor-controllers including means for determining the direction of rotation of the motors upon one or more cars, of controller-actuating means including a source of power local to each car, and a pneumatic train system for governing the operation of the controller-actuating means, said train system being operative to give the proper motor connections upon the reversal of one or more cars of a train.



4. In a system of train control, in combination with motor-controllers on one or more cars, of an automatic controller-actuating system local to each motor-car, and a pneumatic train system for governing its operation.

5. In a system of train control, in combination with motor-controllers upon one or more cars, of an automatic controller-actuating system including a source of power local to each car, and a train system including relays for governing the operation of the controller-actuating system.

6. In a system of train control, in combination with motors of one or more cars of an automatic control system local to each car, relays for controlling the operation of the automatic control system, and a pneumatic train-line for operating said relays.

7. In a system of train control, in combination with motor-controllers on one or more cars of an electric control system local to each motor-car, and a pneumatic train system for governing its operation.

8. In a system of train control, in combination with motor-controllers upon one or more cars, of electromagnetic controller-actuating means including a switch local to each car, and a pneumatic train system for operating said switch.

9. In a system of train control, in combination with motor-controllers upon one or more cars, of an automatic electromagnetic controller-actuating system local to each car, and a pneumatic train system for governing the operation of the controller-actuating system.

10. In a system of train control, in combination with series-parallel motor-controllers upon one or more cars, of actuating means including a source of power therefor local to each car, and a pneumatic train system for governing the operation of said actuating means.

11. In a system of train control, in combination with series-parallel motor-controllers upon one or more cars, of automatic actuating means therefor local to each car, and a pneumatic train system for governing the operation of said actuating means.

12. In a system of train control, in combination with series-parallel controllers upon one or more cars, of an electromagnetic controller-actuating system local to each car, and a pneumatic train system for governing said controller-actuating system or systems.

13. In a system of train control, in combination with motor-controllers upon one or more cars, of controller-actuating means including a source of power local to each car, and a pneumatic train system including two train-pipes for governing the operation of the controller-actuating means.

14. In a system of train control, in combination with motor-controllers upon one or more cars, of automatic controller-actuating means local to each car, and a pneumatic train system including two train-pipes for governing the operation of said controller-actuating means.

15. In a system of train control, in combination with motor-controllers on one or more cars, of automatic controller-actuating means local to each car, two train-pipes, controlling devices for said controller-actuating means operatively related to said train-pipes, and means for admitting compressed fluid to said train-pipes.

16. In a system of train control, in combination with motor-controllers on one or more cars, of an electromagnetic control system local to each car, and a pneumatic train system including two train-pipes for governing the action of the electromagnetic control system.

17. In a system of train control, in combination with series-parallel motor-controllers on one or more cars, of controller-actuating means including a source of power local to each car, and a pneumatic train system including two train-pipes for governing the action of the controller-actuating means.

18. In a system of train control, in combination with motor-controllers upon one or more cars, of controller-actuating means local to each car, relays operatively associated with said controller-actuating means, and two train-pipes connected to said relays.

19. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car and supplied with current from a contact-shoe carried by the car, and a pneumatic train system for governing the operation of the electric control system or systems.

20. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car and supplied with current from a contact-shoe carried by the car, and a pneumatic train system including two train-pipes for governing the action of the electric control system or systems.

21. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car and supplied with current from a contact-shoe carried by its car, relays operatively associated with said electric control system or systems, train-pipes connected to said relays, and means for supplying said train-pipes with compressed fluid.

22. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car and supplied with current from a contact-shoe carried by its car, controlling-relays associated with said electric control system or systems, two train-pipes connected to said relays, and means for supplying said train-pipes with compressed fluid.

23. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of automatic actuating means for the controller-contacts local to each car, and a pneumatic train system for governing the action of the actuating means for the contacts.

24. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of automatic actuating means for the controller-contacts local to each car, and a pneumatic train system including two train-pipes for governing the action of the automatic actuating means for the contacts.

25. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of an automatic actuating system for the controller-contacts local to each car, relays for governing the action of said automatic actuating system or systems, and two train-pipes connected to said relays.

26. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of automatic contact-actuating means local to each car, pistons or diaphragms for governing the action of said contact-actuating means, and two train-pipes in direct communication with said pistons or diaphragms.

27. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of an electric control system for the controller-contacts local to each car and supplied with current from a collector-shoe carried by its car, and a pneumatic train system for governing the action of said electric control system or systems.

28. In a system of train control, in combination with motor-con-

trollers of the separately-actuated contact type on one or more cars, [illegible] tor-controller, controller-actuating means and a plurality of pairs of

pipes, pistons or diaphragms operatively associated with said con- [illegible] magnetic controller-actuating means, pneumatically-actuated de-

trollers of the separately-actuated contact type on one or more cars, of an electromagnetic control system for the controller-contacts located on each car and supplied with current by a collector-shoe carried by its car, and a pneumatic train system including two train-pipes for governing the action of said electromagnetic control system or systems.

29. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of an automatic control system arranged to actuate some or all of the controller-contacts in automatic succession local to each car, and a pneumatic train system for governing the action of said automatic control system or systems.

30. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of means local to each car for operating some or all of the controller-contacts in automatic succession, a governing-relay for the contacts adapted to progress automatically, and a train-pipe connected to said relay.

31. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of an electric system local to each car for operating some or all of the controller-contacts in automatic progression, and a pneumatic train system for governing said electric system or systems.

32. In a system of train control, in combination with motor-controllers of the separately-actuated contact type, of an electric system local to each car for operating the controller-contacts in automatic progression, a piston or diaphragm operatively associated with said electric system for controlling its action and a train-pipe in direct communication with said piston or diaphragm, and means for supplying said train-pipe with compressed fluid.

33. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of an electric control system local to each car arranged to actuate some of the controller-contacts in automatic progression, pneumatically-operated relays for governing the action of said electric control system, and two train-pipes connected to said relays.

34. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car, a pneumatic train system for governing the action of the electric control system, and a manually-operated valve for governing the train system.

35. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of contact-actuating means local to each car and arranged to close certain of the contacts in automatic succession, pneumatically-actuated devices for controlling said contact-actuating means and less in number than the number of contacts, train-pipes connected to said pneumatically-actuated devices, and means for supplying said train-pipes with compressed fluid.

36. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of contact-actuating means local to each car and arranged to close certain of the contacts in automatic succession, pneumatic controlling devices for governing the action of said contact-actuating means, said pneumatic controlling devices being less in number than the number of contacts, train-pipes, and means for supplying said train-pipes with compressed fluid.

37. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of local contact-actuating means, pneumatically-actuated relays for controlling said contact-actuating means, the number of relays being less than the number of contacts, train-pipes connected to said relays, and means for supplying said train-pipes with compressed fluid.

38. In a system of train control, in combination with motor-controllers of the separately-actuated contact type on one or more cars, of a control system local to each car arranged to actuate some of the controller-contacts in automatic progression, a plurality of governing-relays including a relay for governing the actuating means of the contacts arranged to progress automatically, the relays having different settings, train-pipes connected to said relays, and means for supplying said pipes with fluid varying in degree of compression.

39. In a system of train control, one or more cars having a motor-controller, controller-actuating means and a pair of pneumatically-actuated devices for controlling said controller-actuating means local thereto, train-pipes for connecting corresponding devices of each pair, and means for admitting compressed fluid to said train-pipes.

40. In a system of train control, one or more cars having a motor-controller, controller-actuating means and a plurality of pairs of pneumatically-actuated devices for controlling said controller-actuating means local thereto, train-pipes for connecting corresponding devices of each pair, and means for admitting compressed fluid to said train-pipes.

41. In a system of train control, one or more cars having a motor-controller, controller-actuating means and a pair of pneumatically-actuated devices for controlling said controller-actuating means local thereto, train-pipes connected to corresponding devices, and means for admitting compressed fluid to said train-pipes, the direction of motion of the car or train being determined by the order in which the train-pipes are energized.

42. In a system of train control, one or more cars having motor-controllers, controller-actuating means and pneumatically-actuated devices having different settings for controlling said controller-actuating means local thereto, two train-pipes connected to said devices, and means for supplying said pipes with compressed fluid varying successively in degree of compression.

43. In a system of train control, one or more cars having motor-controllers, controller-actuating means and pneumatically-actuated devices for controlling said controller-actuating means local thereto, two train-pipes operatively associated with said devices, and means for admitting compressed fluid successively to said train-pipes, the order in which the fluid is admitted to said train-pipes determining the direction of movement of the car or train.

44. In a system of train control, one or more cars having a motor-controller, electromagnetic actuating means therefor including an energizing-circuit having a switch and a pneumatically-actuated switch-actuating device local thereto, a train-pipe connected with said switch-actuating devices, and means for admitting compressed fluid to said train-pipe.

45. In a system of train control, one or more cars having a motor-controller, electromagnetic actuating means therefor including an energizing-circuit having a switch and a pneumatically-actuated switch-operating means local thereto, two train-pipes operatively related to said switch-operating means, and means for admitting compressed fluid successively to said train-pipes, the order in which fluid is admitted to said train-pipe determining the direction of movement of the car or train.

46. In a system of train control, one or more cars having local thereto motor-controllers, controller-actuating means and pneumatically-actuated devices controlling said controller-actuating means and having settings so arranged that said devices are effective under widely-different pressures, a train-pipe, and means for admitting compressed fluid to said train-pipe.

47. In a system of train control, one or more cars having local thereto motor-controllers, controller-actuating means and devices for controlling said controller-actuating means arranged to be pneumatically actuated under widely-different fluid-pressure, a train-pipe connected to said devices, and means for admitting said train-pipe fluid varying successively in degree of compression.

48. In a system of train control, a motor-controller and an electromagnetic controller-actuating system upon one or more cars, a train-pipe, pistons or diaphragms in open communication with said train-pipe and operatively associated with said controller-actuating system for controlling the same, and a motorman's valve for admitting compressed fluid to said train-pipe.

49. In a system of train control, a motor-controller and an electromagnetic controller-actuating system upon one or more cars, a plurality of pistons or diaphragms operatively associated with each of said systems for controlling the same, train-pipes in open communication with said pistons or diaphragms, and means for connecting said train-pipe to a source of compressed-fluid supply.

50. In a system of train control, a motor-controller and an electromagnetic controller-actuating system upon one or more cars, a group of pistons or diaphragms operatively associated with each of said systems for controlling the same, the individual pistons or diaphragms of each group having different settings, a train-pipe in open communication with said pistons or diaphragms, and means for admitting to said pipe fluid varying successively in degree of compression.

51. In a system of train control, a motor-controller and electromagnetic controller-actuating means on one or more cars, pneumatically-actuated devices for controlling said controller-actuating means, two train-pipes connected to said devices, and a motorman's valve for admitting compressed fluid to said pipes, the direction of movement of the car or train being determined by the pipe to which fluid is first admitted.

52. In a system of train control, a motor-controller and automatic controller-actuating means upon one or more cars, a train-pipe, pistons or diaphragms operatively associated with said controller-actuating means and in open communication with said train-pipe, and a motorman's valve for admitting compressed fluid to said train-pipe.

53. In a system of train control, a motor-controller and an automatic controller-actuating system upon one or more cars, a group of pistons or diaphragms operatively related to each controller-actuating system for controlling the same, said pistons or diaphragms being arranged to operate under widely-differing pressures, a train-pipe in open communication with said pistons or diaphragms, and means for admitting compressed fluid to said train-pipe.

54. In a system of train control, a motor-controller and an automatic controller-actuating system upon one or more cars, pairs of pistons or diaphragms operatively related to each of said systems for controlling the same, train-pipes in open communication with corresponding pistons or diaphragms of the pairs, and means for admitting compressed fluid to said train-pipes, the arrangement being such that both train-pipes are energized during each cycle of motor connections, the direction of movement of the car or train being determined by the pipe which is first energized.

55. In a system of train control, a motor-controller and an automatic controller-actuating system upon one or more cars, a group of pairs of pistons or diaphragms operatively associated with each of said controller-actuating systems, train-pipes in open communication with corresponding pistons or diaphragms of each pair, and means for admitting compressed fluid to said train-pipes, the direction of movement of the car or train being determined by the train-pipe to which fluid is first admitted.

56. In a system of train control, a motor-controller and an automatic controller-actuating system upon one or more cars, a group of pairs of pistons or diaphragms operatively associated with each of said controller-actuating systems, the pairs of pistons of each group having different settings, train-pipes in open communication with corresponding pistons or diaphragms of each pair, and means for admitting to said train-pipes fluid varying successively in degree of compression, the direction of movement of the car or train being determined by the pipe which first receives compressed fluid.

57. In a system of train control, a motor-controller and an automatic controller-actuating system on one or more cars, a piston or diaphragm operatively related to each of said controller-actuating systems for determining the relative connections of the motors and the resistance in the motor-circuit, respectively, said pistons or diaphragms being set for operation under widely-varying degrees of pressure, a train-pipe in open communication with said pistons or diaphragms, and a motorman's valve for connecting said train-pipe to a source of compressed-fluid supply.

58. In a system of motor control, in combination with a motor-controller including means for determining the direction of rotation of the motor or motors, of controller-actuating means, and a pneumatic system including relays for governing the operation of the controller-actuating means.

59. In a system of motor control, in combination with a motor-controller, of an automatic control system including a source of power, a pneumatic system for governing the operation of the automatic control system, said pneumatic system including a controlling-valve.

60. In a system of motor control, a motor-controller, an automatic controller-actuating system, a pneumatically-actuated relay for governing said controller-actuating system, and a pneumatic system for controlling said relay.

61. In a system of motor control, a motor-controller, an automatic controller-actuating system, and a pneumatic system for governing the action of the controller-actuating means, said pneumatic system including two pipes and a control-valve common to said pipes.

62. In a system of control, a motor-controller, automatic controller-actuating means, pneumatically-actuated devices for governing the action of said controller-actuating means, two pipes connected to said pneumatically-actuated devices, and means for supplying said pipes with compressed fluid.

63. In a system of motor control, a motor-controller, an electromagnetic control system, and a pneumatic system for governing the operation of said electromagnetic control system, said pneumatic system including a controlling-valve.

64. In a system of motor control, a motor-controller, electromagnetic controller-actuating means, pneumatically-actuated devices for governing the operation of the controller-actuating means, and means for operating said pneumatically-actuated devices.

65. In a system of motor control, a motor-controller, electromagnetic controller-actuating means, pneumatically-actuated devices for governing the operation of the controller-actuating means, two pipes associated with said pneumatically-actuated devices, and means for supplying said pipes with compressed fluid.

66. In a system of motor control, a motor-controller comprising a plurality of separately-actuated contacts, means including a source of power for operating some or all of said contacts in automatic progression, and a pneumatic system for governing the action of said means for operating the contacts.

67. In a system of motor control, a motor-controller comprising a plurality of separately-actuated contacts, means for actuating said contacts in automatic progression, a pneumatic relay for controlling the operation of said means for actuating the contacts, and means for operating said relay.

68. In a system of motor control, a motor-controller, electromagnetic controller-actuating means, a piston or diaphragm operatively related to said controller-actuating means for governing the operation, a pipe in open communication with said piston or diaphragm, and means for controlling the admission of compressed fluid to said pipe.

69. In a system of motor control, a motor-controller comprising separately-actuated contacts, means for operating said contacts in automatic succession, pneumatically-actuated devices for governing the operation of the contact-operating means and less in number than the number of contacts, and means for supplying said pneumatically-actuated devices with compressed fluid.

70. In a system of motor control, a motor-controller of the separately-actuated contact type, means for actuating the controller-contacts and a portion thereof in automatic progression, pneumatic controlling system for governing the action of the means for actuating the controller-contacts and including means for checking the automatic progression of the contacts without affecting those already operated.

71. In a system of motor control, a motor-controller of the separately-actuated contact type, an electromagnetic system arranged to actuate the controller-contacts and a portion thereof in automatic progression, pneumatic controlling means for said electromagnetic system, including means for checking the automatic progression of contacts without affecting the contacts already actuated.

72. In a system of train control, in combination with motor-controllers of the separately-actuated contact type of actuating means for the controller-contacts local to each car and arranged to actuate said contacts in whole or in part in automatic progression and a pneumatic train system for governing the actuating means for the controller-contacts, said train system including a motorman's valve and the arrangement of parts being such that the automatic progression of contacts may be checked from the motorman's valve without affecting the control already actuated.

73. In a system of motor control, a motor-controller comprising a plurality of separate contacts, actuating means arranged to operate said contacts in automatic progression, maintaining means for said contacts, and a pneumatic control system including means for rendering said actuating means inoperative at any stage of the automatic progression of the contacts without affecting the maintaining means of the contacts already operated.

74. In a system of motor-control, a motor-controller comprising a plurality of contacts, actuating means arranged to operate said contacts in automatic progression and means for maintaining them in their actuated positions, a pneumatic control system including a valve, and means for rendering the actuating means inoperative from the valve at any stage of the automatic progression of the contacts.

75. In a system of motor-control, a motor-controller comprising a plurality of separate contacts, actuating means arranged to operate said contacts in automatic progression, and a pneumatic control system including means for rendering said actuating means inoperative at any stage of the automatic progression of the contacts.

76. In a system of train control, one or more cars having a motor-controller comprising separate contacts, actuating means arranged to operate said contacts in automatic progression and contact-maintaining means, a pneumatic train system including means for rendering the several actuating means inoperative at any stage of the automatic progression of the contacts without affecting the maintaining means for the contacts already actuated.

77. In a system of motor control, a motor-controller comprising a plurality of separate contacts, electromagnetic controlling means for said contacts including an actuating-circuit for actuating said contacts in automatic progression, and a pneumatic control system including means for rendering the actuating-circuit inoperative at any stage in the automatic progression of the circuits.

78. In a system of motor control, a motor-controller comprising a plurality of contacts, electromagnetic controlling means for said contacts including an actuating-circuit for operating said contacts in automatic progression and a maintaining-circuit, and a pneumatic control system including means for rendering the actuating-circuit inoperative at any stage in the progression of the contacts without affecting the maintaining-circuit of the contacts already actuated.

79. In a system of train control, one or more cars having a motor-controller comprising a plurality of contacts, electromagnetic actuating means arranged to operate said contacts in automatic progression and electromagnetic maintaining means for said contacts, a pneumatic train system including means for rendering the several actuating means inoperative at any stage of the automatic progression

80. In a system of train control, one or more cars having a motor-controller comprising a plurality of separate contacts, electromagnetic controlling means for said contacts including an actuating-circuit for actuating said contacts in automatic progression and a maintaining-circuit, a pneumatic train system including means for rendering said actuating-circuit inoperative at any stage of the automatic progression of the contacts without affecting the maintaining-circuits of the contacts already actuated.

81. In a system of train control, one or more cars having a motor-controller comprising a plurality of separate contacts, actuating means arranged to operate said contacts in automatic progression, contact-maintaining means and pneumatic controlling devices for said actuating and maintaining means, a train-pipe connected to said devices, and means for admitting compressed fluid to said train-pipe.

82. In a system of train control, one or more cars having a motor-controller comprising a plurality of contacts, actuating means arranged to operate said contacts in automatic progression, contact-maintaining means and pneumatic controlling devices for said actuating and maintaining means, said devices having different settings, a train-pipe connected to said devices and means for supplying compressed fluid to said train-pipe.

83. In a system of train control, one or more cars having a motor-controller comprising a plurality of separate contacts and electromagnetic controlling means including an actuating-circuit for actuating said contacts in automatic progression and maintaining-circuits for said contacts, a pneumatic train system including a motorman's valve and means whereby the several actuating-circuits may be rendered inoperative from said motorman's valve without affecting the maintaining-circuits of the contacts already actuated.

84. In a system of control, a motor-controller comprising a plurality of separate contacts, actuating means arranged to operate said contacts in automatic progression and maintaining means for said contacts, a pneumatic control system including a relay for controlling the actuating means and a second relay for controlling the maintaining means.

85. In a system of train control, one or more cars having a motor-controller comprising a plurality of contacts, actuating means arranged to operate said contacts in automatic progression, contact-maintaining means and pneumatic control devices for said actuating and said maintaining means, a train-pipe connected to said devices, and means for controlling the pressure in said train-pipe so as to render said actuating means inoperative at any stage of the automatic progression of the contacts without affecting the maintaining means of the contacts already actuated.

86. In a system of train control, one or more cars having a motor-controller comprising a plurality of contacts, actuating means adapted to operate said contacts in automatic progression, contact-maintaining means and pneumatic control devices having different settings, a train-pipe and a motorman's valve arranged so that the train-pipe pressure may be varied in order to cause said several actuating means to be rendered inoperative at any stage in the automatic progression without affecting the contacts already actuated.

87. In a system of train control, one or more cars having a motor-controller comprising a plurality of contacts, electromagnetic controlling means for said contacts including an actuating-circuit for operating said contacts in automatic progression and a maintaining-circuit, and pneumatic devices having different settings for controlling said circuits, a train-pipe and means for admitting to said pipe fluid varying successively in degree of compression.

88. In a system of train control, one or more cars having a motor-controller comprising contacts, electromagnetic controlling means including an actuating-circuit for operating said contacts in automatic progression and a maintaining-circuit, and pneumatic devices having different settings for controlling said circuits, a train-pipe connected to said devices, and means for controlling the pressure in said pipe in such a manner that the several actuating-circuits may be rendered inoperative at any stage in the automatic progression of the contacts without affecting the maintaining-circuits of the contacts already actuated.

89. In a system of motor control, a motor-controller, an automatic control system and a pneumatic system for governing the action of the control system, said pneumatic system including a valve whereby the motor-controller may be caused to progress intermittently by a series of steps or to progress continuously through the same steps.

90. In a system of train control, in combination with motor-controllers upon one of more cars, of an automatic control system local to each car, and a pneumatic train system for governing the operation of the automatic control system or systems, said train system including a motorman's valve whereby the motor-controller may be caused to progress by a series of intermittent steps or to progress continuously through the same series of steps.

91. In a system of train control, in combination with motor-controllers on one or more cars, of an electric control system local to each car and a pneumatic train system for governing said electric control system, the arrangement of parts being such that the motor controller or controllers may be made to progress by a series of intermittent steps or to progress automatically and continuously through the same steps.

92. In a system of motor control, a motor-circuit, a plurality of pairs of circuit-controlling pistons or diaphragms, the operation of both pistons or diaphragms of one pair and one piston or diaphragm of each of the other pairs serving to make a complete cycle of circuit connections.

93. In a system of motor control, a motor-circuit, contacts therein, contact-controlling means, a plurality of pairs of pneumatically-actuated devices for controlling said contact-controlling means, the operation of both devices of one pair and one device of each of the other pairs serving to make a complete cycle of motor connections.

94. In a system of train control, in combination with motor-controllers upon one or more cars, of controller-actuating means and one or more pairs of pistons or diaphragms for governing said controller-actuating means local to each car, train-pipes pneumatically connected to corresponding pistons or diaphragms, and means for supplying compressed fluid to said train-pipes.

95. In a system of train control, in combination with motor-controllers on one or more cars, of controller-actuating means and one or more pairs of pistons or diaphragms for governing the action of said controller-actuating means local to each car, train-pipes pneumatically connected to corresponding pistons or diaphragms and a motorman's valve for connecting said train-pipes successively to a source of compressed-fluid supply.

96. In a train-control system, two train-pipes, a motor-circuit upon one or more cars, a plurality of pairs of circuit-controlling pistons or diaphragms arranged on each of said cars and connected to said train-pipes, the operation of both pistons or diaphragms of one pair and one piston or diaphragm of each of the other pairs serving to make a complete cycle of circuit connections.

97. In a train-control system, two train-pipes, one or more cars having a motor-circuit and a plurality of controlling pistons or diaphragms connected in pairs to said train-pipes, both pistons or diaphragms of one of the pairs being operated during each complete cycle of motor connections, and the direction of movement of the car or train depending upon the order in which the pistons or diaphragms of said latter pair are operated.

98. In a system of motor control, a plurality of motors, two pipes, means controlled by fluid-pressure in one of said pipes for closing the main circuit, connecting the motors in series and cutting resistance out of the motor-circuit, and means controlled by the fluid-pressure in the other pipe for connecting the motors in parallel.

99. In a system of motor control, a plurality of motors, two pipes, means controlled by fluid-pressure in either of said pipes for closing the main circuit, connecting the motors in series and cutting the resistance out of the motor-circuit, and means controlled by fluid-pressure in the other of said pipes for connecting the motors in parallel.

100. In a system of motor control, a plurality of motors, two pipes, means controlled by fluid-pressure in either of said pipes for connecting the motors in series and accelerating them, and means controlled by fluid-pressure in the other of said pipes for connecting the motors in parallel, the direction of rotation of the motors being determined by the order in which fluid-pressure is admitted to the train-pipes, together with means for connecting said pipes to a source of compressed-fluid supply.

101. In a system of motor control, a plurality of motors, two pipes, means controlled by fluid-pressure in either of said pipes for connecting the motors in series and accelerating them, and means controlled by fluid-pressure in the other pipe for connecting the motors in parallel, together with a motorman's valve for connecting the train-pipes with a source of compressed-fluid supply.

102. In a system of train control, a motor-controller, a controller-actuating means on one or more cars, controlling devices arranged to operate under widely-varying degrees of fluid-pressure operatively related to said controller-actuating means, a train-pipe communicating with said devices, and means for supplying said train-pipe with fluid varying successively in degree of compression applied.

103. In a system of train control, a motor-circuit upon each of a plurality of cars, two train-pipes, a plurality of movable switch members upon each car for controlling the circuit connections, a plurality of actuating devices for each of said members communicating with said train-pipes, and means for admitting compressed fluid into the train-pipes.

104. In a system of train control, a motor-circuit upon each of a plurality of cars, two train-pipes, a plurality of movable switch members upon each car for controlling the circuit connections, a plurality of actuating devices for each of said members in communication with said train-pipes, the order in which the fluid is admitted to the train-pipes determining the direction of movement of the car or train.

105. In a system of train control, controllers on one or more cars for varying the speed and the direction of rotation of the motors, automatic electromagnetic actuating means for said controllers local to said car or cars, relays for connecting said actuating means to local current-collecting devices, and a train-line for controlling said relays.

106. In a system of train control, motor-controllers on one or more cars comprising a series of separately-actuated contacts arranged to be operated in part in automatic succession, local electromagnetic actuating means for said controllers, relays for connecting said actuating means to local current-collecting devices and including a relay for governing the operation of the contacts arranged to be actuated in automatic succession, and a train-line for controlling said relays.

107. In a system of train control, motor-controllers on one or more cars comprising a series of separately-actuated contacts arranged to be operated in part in automatic succession, automatic electromagnetic actuating systems for said controllers local to said car or cars, and a train system for governing said actuating systems including relays arranged to connect said actuating systems to local current-collecting devices.

809,909. MANUFACTURE OF ARTIFICIAL MOTHER-OF-PEARL. PETER C. D. CASTLE, Bebington, England. Filed Aug. 24, 1903. Serial No. 170,046.

Claim.—1. As a new article of manufacture a hard block of artificial substance formed of the pearly matter of shells, cementitious matter and a soft pulverulent alkaline-earth silicate pressed into a hard block.

2. As a new article of manufacture a substance formed of finely-powdered pearly matter of shells, cementitious matter and finely-ground mica pressed into a hard mass.

3. As a new article of manufacture, an artificial substance composed of finely-powdered pearl-shell and gum-sandarac.

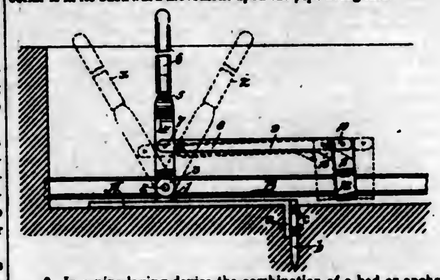
4. As a new article of manufacture an artificial substance formed of finely-powdered pearly matter, gum-sandarac and a finely-powdered mineral silicate having a saponaceous feel.

5. The process of manufacturing artificial mother-of-pearl, which consists in mixing pulverized pearly matter of shells, finely-ground white mineral matter, gum-sandarac, and a solvent; and subjecting the mass thus produced to pressure in the presence of heat.

6. The improved process of manufacturing artificial mother-of-pearl, which consists in pulverizing the solid materials which enter into the composition and mixing them with gum-sandarac and a solvent; pressing the mass thus produced in the presence of heat; and finally cooling the mass while the pressure is maintained thereon.

809,910. PIPE-LAYING DEVICE. GRAHAM DU LEY, Omaha, Nebr., assignor of one-third to Abram B. Hunt and one-third to Charles J. Collins, Omaha, Nebr. Filed July 1, 1905. Serial No. 267,262.

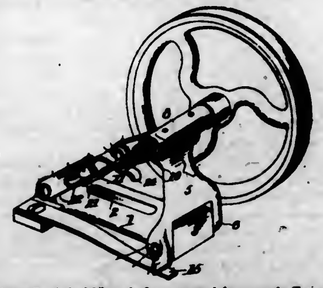
Claim.—1. In a pipe-laying device the combination with the bed or anchor plate provided at one end with the downwardly-extending bent end portion which extends crosswise of the length of the anchor-plate, ears extending upwardly from said anchor-plate, yoked legs of the yoked operating-lever pivoted to said ears, a handle secured to said yoked operating-lever, yoked ends of the yoked connecting-link pivotally secured intermediate of the legs of the yoked operating-lever, a gripping-collar having the shank pivoted to the opposite yoked end of said connecting-link and a lip or stop depending from the lower side of said link at the gripping-collar end to prevent the collar from working out at a less angle than a right angle to the pipe gripped and carried by said grip-collar, when the collar is in its backward movement upon the pipe being laid.



2. In a pipe-laying device the combination of a bed or anchor plate, and having one end bent at right angles thereto, there being ears extending upward from the top of said anchor-plate, an operating-lever having a yoked end and pivotally secured to said ears, a connecting-link having a yoked end and pivotally intermediate the legs of said first-mentioned yoke, and clutch or grip collar pivoted to the opposite end of said connecting-link, and there being a lip depending from said last-mentioned end of said link, to prevent the collar from working at an angle less than a right angle to a pipe being laid in its backward movement upon the pipe.

3. As a new article of manufacture, a pipe-laying device, comprising an approximately rectangular plate provided at one end with the downwardly-projecting end portion extending crosswise of the length of the plate, an operating-lever pivoted to said plate, and means for gripping the pipe adapted to be laid, substantially as shown and described.

809,911. SEWING-MACHINE BOBBIN-WINDER. GEORGE M. RAMEY and JOHN S. PENOR, Bridgeport, Conn., assignors to Wheeler & Wilson Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed May 26, 1905. Serial No. 262,233.



Claim.—1. A bobbin-winder, comprising a spindle, a driving-pulley thereon, a spindle carrier or standard, a spring tending to throw said standard out of operative position, and a latch to hold the standard in operative position, said latch including a pair of levers whose adjacent ends are pivoted together and whose opposite ends are pivoted respectively to said standard and the base on which the latter is mounted, thereby forming a toggle between said base and standard to hold the latter in operative position, and means actuated by the filling of the bobbin for shifting the knuckle of said toggle out of alinement with its pivotal extremities.

2. A bobbin-winder, comprising a spindle, a driving-pulley thereon, a spindle carrier or standard, a spring tending to throw said spindle-carrier out of operative position, and a latch to hold the spindle-carrier in operative position, said latch including a pair of

levers whose adjacent ends are pivoted together and whose opposite ends are pivoted respectively to said spindle-carrier and the base on which the latter is mounted, thereby forming a toggle between said base and spindle-carrier to hold the latter in operative position, a stop for limiting the movement of said levers in advancing the parts to operative position, and means actuated by the filling of the bobbin for shifting the knuckle of said toggle out of alinement with its pivotal extremities to release the winder from operative position.

3. A bobbin-winder, comprising a spindle, a driving-pulley thereon, a spindle carrier or standard, a spring tending to throw said standard out of operative position, and a latch to hold the spindle-carrier in operative position, said latch including a pair of levers whose adjacent ends are pivoted together and whose opposite ends are pivoted respectively to said spindle-carrier and the base on which the latter is mounted, thereby forming a toggle between said base and spindle-carrier to hold the latter in operative position, a stop for limiting the movement of said levers in advancing the parts to operative positions, and adjustable means actuated by the filling of the bobbin for shifting the knuckle of said toggle out of alinement with its pivotal extremities, whereby the quantity of thread wound upon the bobbin may be regulated.

4. A bobbin-winder, comprising a spindle, a driving-pulley thereon, a pivoted standard on which the spindle is mounted, a spring tending to throw said standard out of operative position, and a latch to hold the standard in operative position, said latch including a bell-crank lever one arm of which extends in close proximity to the bobbin to be wound and is adapted to be engaged and actuated thereby and the other arm of which is connected to a lever pivoted to the base.

5. In a bobbin-winder, comprising a spindle, a driving-pulley thereon, a pivoted standard on which the spindle is journaled, a spring tending to throw said standard out of operative position, and a latch to hold the standard in operative position, said latch including a bell-crank lever one arm of which extends in close proximity to the bobbin to be wound and is adapted to be engaged and actuated thereby and the other arm of which is connected to a lever pivoted to the base and provided at one end with a thumb-piece which overlaps one arm of said bell-crank and serves as a stop to position said levers for holding the winder in engagement with the driving agent.

6. A bobbin-winder, comprising a spindle, and a driving-pulley thereon, a pivoted standard on which the spindle is journaled, a spring tending to throw said standard out of operative position, and a latch to hold the standard in operative position, said latch including a bell-crank lever one arm of which comprises a resilient adjustable tripping-finger or trigger secured to said lever by an adjusting-screw and extending in close proximity to the bobbin to be wound and adapted to be engaged and actuated thereby, the other arm of said bell-crank connected to a lever pivoted to the base and provided at one end with a thumb-piece which overlaps one arm of said bell-crank and serves as a stop to position said levers for holding the winder in engagement with the driving agent.

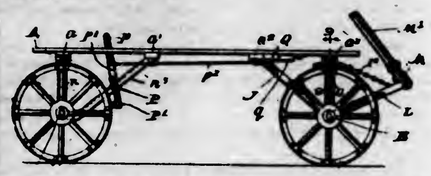
7. A bobbin-winder, comprising a base, a standard pivoted on said base and having an eccentrically-arranged lateral projection at or near its bottom, a spindle mounted on said standard, a driving-pulley on said spindle, a spring secured to the base and adapted to bear upon the lateral projection in such manner as to normally throw the standard out of operative position, and a breakdown latch to hold the standard in operative position.

8. A bobbin-winder, comprising a standard or spindle-carrier suitably mounted upon a base, a spring tending to throw said standard out of operative position, a spindle journaled within said standard and having on one end a driving-pulley, and at the other end provided with a shoulder whose edge adjacent the bearing is housed within a recess in said standard whereby the thread is guarded from winding between said shoulder and bearing.

9. A bobbin-winder, comprising a standard or spindle-carrier suitably mounted upon a base, a spring tending to throw said standard out of operative position, a latch for holding said standard in operative position, a spindle journaled within said standard and having on one end a driving-pulley and its other end provided with a shoulder or stop whose edge adjacent the bearing is housed within a recess in said standard and whose periphery is tapered in a direction toward the bobbin position, whereby thread inadvertently wound thereon may be easily removed.

809,912. WAGON. HENRY L. FRAHM, Harvard, Ill., assignor to Hunt, Helm, Ferris & Company, Harvard, Ill., a Corporation of Illinois. Filed Feb. 23, 1905. Serial No. 247,033.

Claim.—1. In a device of the class described, the combination with a wagon-bed, of an axle swiveled thereto, hounds secured to the axle, a tongue pivoted to the hounds and devices on the hounds and handle which engage when the handle is swung up to prevent relative lateral movement.



2. In a device of the class described, the combination with a wagon-bed, of an axle swiveled thereto, hounds secured to the axle, a tongue pivoted to the hounds to swing vertically and means constructed and arranged to engage the tongue when swung up to prevent its lateral movement.

3. In a device of the class described, the combination with a wagon-bed, of an axle swiveled thereto, hounds secured to the axle, a tongue pivoted to the hounds, mutually engaging portions on the tongue and hounds above the pivot, said engaging portions being constructed and arranged to engage when the tongue is swung up to prevent its lateral movement.

4. In a device of the class described, the combination with a wagon-bed, of an axle swiveled thereto, hounds secured to the axle, a tongue pivoted to the hounds, a notch on one of said parts and a lug on the other, said notch and lug being constructed and arranged to engage when the tongue is swung up to prevent relative lateral movement of the tongue and hounds.

5. In a device of the class described, the combination with a wagon-bed, of an axle swiveled thereto, hounds secured to the axle, a tongue pivoted to the hounds, a notch on the hounds, and a lug on the tongue engaging therewith to prevent lateral movement between the tongue and hounds when the tongue is swung back.

6. In a device of the class described, the combination with a wagon-bed and an axle swiveled thereto, of hounds pivoted to the axle, means for limiting the downward movement of the hounds, a tongue pivoted to the hounds, and means independent of the pivot for preventing relative lateral movement between the tongue and hounds when the tongue is swung up.

7. In a device of the class described, the combination with a wagon-bed and an axle swiveled thereto, of hounds in the form of a V-shaped casting secured to the axle, projecting ends on the legs of said casting, a tongue pivoted between said projecting arms, a notched cross-bar behind said arms, a lug on the tongue engaging with the notch in the cross-bar when the tongue is swung back.

8. In a device of the class described, the combination with a wagon-bed and an axle swiveled thereto, of hounds in the form of a V-shaped casting pivoted to the axle, projecting ends on the legs of said casting, a tongue pivoted between said projecting ends, a notched cross-bar behind said ends, a lug on the tongue engaging with the notch in the cross-bar when the tongue is swung back, and means for limiting the downward movement of the hounds.

9. In a device of the class described, the combination with a wagon-bed and turn-table, of an arch secured to the turn-table, an axle secured to the arch, a bracket on the center of the axle having an upwardly-projecting boss, a king-bolt entering said boss, a projecting lug on one side of said boss, and an oppositely-inclined edge on the other, and a brace surrounding said boss and secured at the opposite end to the wagon-bed, said brace being adapted to be first placed under said lug and swung down over said inclined edge, and when so positioned to be incapable of vertical removal, except upon angular movement.

10. In a device of the class described, the combination with a wagon-bed and turn-table, of a downwardly-open channel-iron secured to the turn-table, a brace having a central portion lying in said channel-iron and having two downwardly and outwardly extending legs, a second brace having a central portion lying in said channel-iron below said first brace and having downwardly and outwardly extending legs of less slant than the legs on said first brace, an axle, and brackets on the axle to which the adjacent ends of the braces are secured.

11. In a device of the class described, the combination with a wagon-bed and turn-table, of a downwardly-open channel-iron secured to the turn-table, a brace having a central portion lying in said channel-iron, and having two downwardly and outwardly extending legs, a second brace having a central portion lying in said channel-iron below said first brace and having downwardly and outwardly extending legs of less slant than the legs on said first brace, an axle, and brackets on the axle to which the adjacent ends of the braces are secured, said brackets being split and secured on said axle by clamping means.

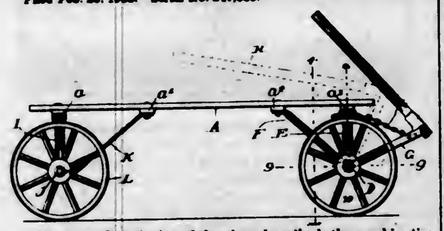
12. In a device of the class described, the combination with a wagon-bed, of a brace having a central portion and two downwardly and outwardly extending legs, a second brace having a central portion lying below the central portion of the first-named brace, and downwardly and outwardly extending legs of less slant than the legs on the first-named brace, an axle, and brackets on the axle to which the adjacent ends of the legs are secured, said brackets being split and secured on the axle by clamping means.

13. The combination with a wagon-bed and a turn-table, of an arch secured to the turn-table and an axle secured to the arch, a bracket on the center of the axle having an upwardly-projecting boss, a king-bolt entering said boss and a bracket secured to the wagon-bed and surrounding said boss, said bracket being adapted to pass freely over said boss when in an abnormal position and to be rigidly secured to said boss when in its normal position.

14. In a device of the class described, the combination with the front axle of a wagon, of a pair of hounds pivotally secured to the axle, and a tongue pivotally secured to the hounds, whereby when the tongue is swung back its pivot upon the hounds will rise.

15. The combination with the front axle of a wagon, of a pair of hounds pivotally secured thereto and of sufficient length to reach when swung up substantially to the level of the wagon-bed, and a tongue pivotally secured to the end of said hounds.

809,913. WAGON. HENRY L. FRAHM, Harvard, Ill., assignor to Hunt, Helm, Ferris & Company, Harvard, Ill., a Corporation of Illinois. Filed Feb. 23, 1905. Serial No. 247,033.



Claim.—1. In a device of the class described, the combination with a wagon-bed and a front axle swiveled thereto, of the hounds pivoted to said axle, means for limiting the downward swing of the hounds and a tongue swiveled to the hounds.

2. In a device of the class described, the combination with a wagon-bed and a front axle swiveled thereto, of the hounds secured to the front axle, a channel-piece secured to the hounds, and a tongue pivoted to the channel-piece and having an end held therein against lateral movement when the tongue is swung upward.

3. In a device of the class described, the combination with a wagon-bed and a front axle swiveled thereto, of the hounds secured to the front axle, a squared channel-piece secured to the hounds and a tongue having a squared end pivoted to the channel-piece, said squared end being adapted to fit the channel-piece when the tongue is swung up.

4. In a device of the class described, the combination with a wagon-bed and a front axle swiveled thereto, of the hounds pivoted to the axle, means for limiting the downward movement of the hounds, a channel-piece secured to the hounds and a tongue pivotally secured to said channel-piece and having an end adapted to fit therein when the tongue is swung up.

5. In a device of the class described, the combination with an axle and a support passed over the same and supporting the wagon-bed, of a bracket perforated to receive the axle and having a notch to receive the support and a brace running from the wagon-bed to said bracket.

6. In a device of the class described, the combination with an axle and a support passed over the same and supporting the wagon-bed, of a bracket perforated to receive the axle and having a notch to receive the support and a brace running from the wagon-bed to said bracket, said bracket being provided with a flange against which one of the wheels of the wagon can run.

7. In a device of the class described, the combination with a wagon-bed, of an arched member supporting the same, said arched member being channel-shaped in cross-section, an axle extending through perforations in the main web of said arched member, and wheels mounted upon the ends of the axle outside of said arched member.

8. In a device of the class described, the combination with a wagon-bed, of an arched member supporting the same, said arched member being channel-shaped in cross-section, an axle extending through perforations in the main web of said arched member, perforated caps mounted upon the axle outside of said arched supporting member and wheels mounted upon the axle outside of said caps.

809,914. LOOSE-LEAF LEDGER. ROBERT J. FRANK, Chicago, Ill., assignor to Standard Audit Company, Chicago, Ill., a Corporation of Illinois. Filed June 26, 1905. Serial No. 267,522.

Claim.—1. In a loose-leaf ledger, the combination of a pair of side frames mounted in movable relation to each other, rack mechanism upon one of such side frames, a rack-operating shaft rotatably mounted upon the other side-frame member and provided with tooth mechanism in engagement with such rack mechanism, a locking-socket member, and mechanism connected with the rack-operating shaft and movable into and out of locking engagement with such socket member.

2. In a loose-leaf ledger, the combination of a pair of side frames mounted in movable relation to each other, rack mechanism upon one of such side frames, a rack-operating shaft rotatably mounted upon the other side-frame member and provided with tooth mechanism in engagement with such rack mechanism, a locking-socket, a locking element connected with the rack-operating shaft and movable into and out of engagement with such locking-socket, and a spring for holding such locking mechanism in engagement with the locking-socket.

3. In a loose-leaf ledger, the combination of a pair of side-frame members mounted in movable relation to each other, rack mechanism upon one of such side-frame members, a rack-operating shaft mounted upon the other side-frame member having tooth mechanism in engagement with such rack mechanism and provided with an angular end portion, and mechanism mounted in engagement with such angular end portion for holding it locked and thereby holding the side-frame members in fixed relation to each other.

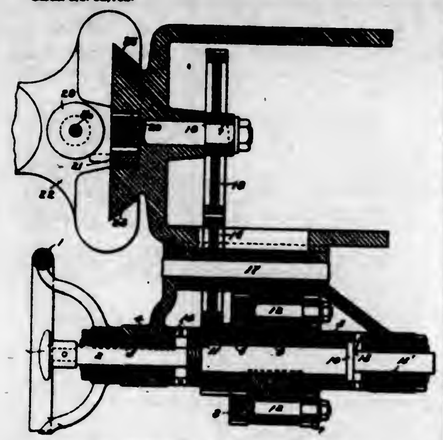
4. In a loose-leaf ledger, the combination of a pair of side-frame members mounted in movable relation to each other, rack mechanism upon one of such side-frame members, a rack-operating shaft mounted upon the other side frame having tooth mechanism in engagement with such rack mechanism and provided with an angular end portion, a socket member, and an angular locking-sleeve slidably mounted upon the angular end portion of such shaft and movable into and out of locking engagement with such socket member.

5. In a loose-leaf ledger, the combination of a pair of side-frame members mounted in movable relation to each other, rack mechanism upon one of such side-frame members, a rack-operating shaft mounted upon the other side-frame member having tooth mechanism in engagement with such rack mechanism and provided with an angular end portion, a socket member, an angular locking-sleeve slidably mounted upon the angular end portion of such shaft and movable into and out of locking engagement with such socket member, and means for automatically moving such locking-sleeve into locking engagement with the socket member.

6. In a loose-leaf ledger, the combination of a pair of side-frame members mounted in movable relation to each other, rack mechanism upon one of such side-frame members, a rack-operating shaft mounted upon the other side-frame member having tooth mechanism in engagement with such rack mechanism and provided with an angular end portion, a socket member, an angular locking-sleeve slidably mounted upon the angular end portion of such shaft and movable into and out of locking engagement with such socket

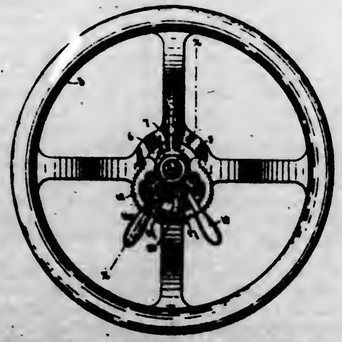
member, and a spring in engagement with such locking-sleeve for holding it yieldingly in locking position.

809,915. **GEARING.** CHARLES R. GARDNER, Providence, R. I., assignor to Brown & Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Original application filed Mar. 1, 1900, Serial No. 7,07,206. Divided and this application filed Oct. 11, 1900. Serial No. 32,702.



Claim.—The combination of a rotatable and slidable shaft, a sun-gear loosely mounted on said shaft, a differential gear loosely mounted on said shaft, a planet-gear carrier secured on said shaft and rotated thereby, planet-gears mounted in said carrier and connecting said sun and planet gears, a stationary clutch member for engaging said sun-gear, and a clutch member secured to revolve with said shaft, whereby a sliding of said shaft will serve to engage one of said clutch members and to disengage the other, substantially as described.

809,916. **CONTROLLING DEVICE FOR MOTOR-VEHICLES.** JOHN C. GALLAGHER, Elmira, N. Y. Filed Nov. 5, 1904. Serial No. 231,511.



Claim.—1. The combination, with a steering shaft and wheel, of a tubular standard through which the shaft passes and a revolvable control-rod mounted upon the standard at one side and projecting above the hub of the steering-wheel.

2. The combination, with a steering shaft and wheel, of a tubular standard through which the shaft passes, an extension rising from the standard through an opening provided therefor in the wheel adjacent to the hub, a control-rod mounted at one side of the standard and passing through said extension, and means for operating said rod secured thereto above the extension.

3. The combination, with a steering shaft and wheel, of a tubular standard through which the shaft passes, an extension rising from the standard through an opening provided therefor in the wheel around the hub, a control-rod mounted at one side of the standard and passing through said extension, and means for operating said rod secured thereto above the extension.

4. The combination, with a steering shaft and wheel, of a tubular standard through which the shaft passes, an extension rising from the standard through an opening around the wheel-hub, a revolvable control-rod passing through the extension, a lever for operating said rod, a toothed segment attached to the extension, and a spring-actuated locking-pin on the lever, to engage the segment.

5. The combination, with a steering shaft and wheel, of a tubular standard for the shaft, revolvable control-rods mounted on the standard, levers for operating said rods, and an adjustable link connection between said levers.

6. The combination, with revolvable control-rods, of an adjustable connection between the rods, whereby they may be set at different angular positions relatively to one another and both operated simultaneously.

7. The combination, with a steering shaft and wheel, of a tubular standard for the shaft, one or more revolvable control-rods mounted parallel with and outside the standard, said rods passing up through an opening provided therefor in the steering-wheel, and a lever or levers for operating said rod or rods in line with and projecting out toward the rim of the wheel for the purpose set forth.

809,917. **ELECTRIC HEATER FOR OIL-WELLS AND METHOD OF MAKING SAME.** BENJAMIN F. GARDNER, Chicago, Ill., assignor to the Petroleum Electric Producing Company, Chicago, Ill., a Corporation of the District of Columbia. Filed Apr. 5, 1905. Serial No. 253,894.

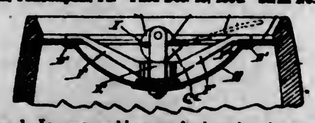
Claim.—1. An electric heater comprising a metallic pipe, a non-vitreous insulating-covering on said pipe, a layer of non-metallic resistance material incased in said insulating material, and electrodes embedded in said resistance material, one of said electrodes being connected to the source of electric current and the other being grounded.

2. An electric heater comprising a metallic pipe, a layer of non-vitreous insulating material, a layer of non-metallic resistance material and a layer of non-vitreous insulating material, said layers being superposed one upon the other and upon said pipe, and electrodes embedded between the resistance material and one of the layers of insulating material, one of said electrodes being connected to the source of electric current and the other being grounded to the pipe.

3. An electric heater comprising a metallic pipe, a layer of non-vitreous insulating material, a layer of non-metallic resistance material and a layer of non-vitreous insulating material, said layers being superposed one upon the other and upon said pipe, and electrodes embedded between the resistance material and one of the layers of insulating material, said materials being bound together and upon said pipe in a homogeneous mass, one of said electrodes being connected to the source of electric current and the other being grounded to the pipe.

4. The herein-described method of making an electric heater which consists in wrapping upon a metallic pipe a layer of non-vitreous insulating material, a layer of non-metallic resistance material, and a layer of non-vitreous insulating material, said layers being superposed one upon the other, applying electrodes between the layer of resistance material and one of the layers of insulating material at the time said layers are arranged in place, and finally vulcanizing the same.

809,918. **REMOVABLE HEAD FOR BARRELS.** ALEXANDER JARDIM, Philadelphia, Pa. Filed Dec. 13, 1904. Serial No. 236,702.

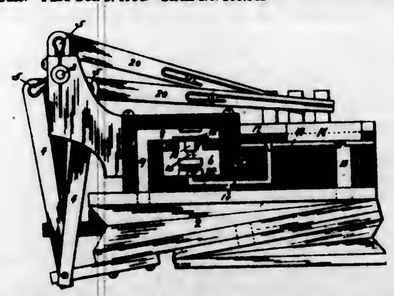


Claim.—1. In a removable cover for barrels, a head secured in one end of the barrel, said head being provided in the center with an

oblong opening, a removable cover also formed oblong so as to pass through the opening into the interior of the barrel, said cover being slightly larger than the opening so as to fit against the under side of the plate, a spanner extending across the opening, each end of the spanner resting upon the upper side of the plate, a stud extending upward from the cover adapted to be guided in the spanner so as to slide vertically relative thereto, a disk eccentrically pivoted to the upper end of the stud and adapted to bear against the upper surface of the spanner, means for turning said disk, and means for locking the same in position, as specified.

2. In a removable cover for barrels, a head secured in one end of the barrel, said head being provided in the center with an oblong opening, a concaved cover also formed oblong so as to pass through the opening into the interior of the barrel, said cover being slightly larger than the opening so as to fit against the under side of the plate, the periphery of said cover being provided with an annular groove into which packing or sealing material may be held, a spanner extending across the opening through the plate, each end of the spanner resting upon the upper side of the plate, lugs extending downward from the spanner adapted to fit inside of the walls of the opening of the plate, projections extending inward from opposite sides of the opening of the plate against which said studs are adapted to contact when the cover and spanner are in their normal positions, a lug extending upward from the cover, the upper end of said lug being bifurcated, the central portion of the spanner adapted to fit and slide between the prongs of the lug, a disk pivoted eccentrically to the upper end of the lug between the prongs, a notch formed in the periphery of the disk in which a lever may be inserted for turning the same, a widened portion formed upon the disk adapted to contact the stud when the cover is locked in place, said disk provided with an opening through which a cotter-pin may be inserted upon the opposite side of the stud from the widened portion to lock the disk against movement in either direction, as specified.

809,919. **PNEUMATIC MOTOR.** LAWRENCE U. JONES, Cincinnati, Ohio. Filed Dec. 5, 1904. Serial No. 235,545.



Claim.—1. In a pneumatic motor the combination with a bellows, of a bellows-passage communicating therewith, a valve-passage leading from the bellows-passage to the exhaust-passage; an exhaust-passage communicating with the valve-passage by way of a port; a valve controlling said port; a pneumatic placed in said exhaust-passage operating said valve; a pneumatic-passage leading from said pneumatic in the exhaust-passage to the outer air with a pneumatic-port at the outer end thereof; an air-passage communicating with said bellows, having an air-port at the outer end thereof, the pneumatic-port and air-port being controlled by a single slide-valve, substantially as described.

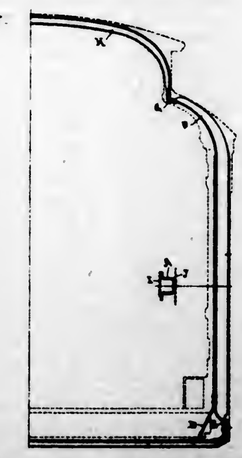
2. In a pneumatic motor the combination with a bellows, of a bellows-passage communicating therewith; a valve-passage leading from the bellows-passage to the exhaust-passage; an exhaust-passage communicating with the valve-passage by way of a port; a valve controlling said port; a pneumatic placed in said exhaust-passage operating said valve; a pneumatic-passage leading from said pneumatic in the exhaust-passage to the outer air with a pneumatic-port at the outer end thereof; an air-passage communicating with said bellows, having an air-port at the outer end thereof, the pneumatic-port and air-port being controlled by a single slide-valve, which alternately opens and closes said ports; and means for operating said slide-valve by the collapse of the bellows, substantially as described.

3. In a pneumatic motor the combination with a bellows, of a driving-shaft having bellows and valve-cranks; links connecting the bellows with said cranks; a bellows-passage and valve-passage leading from the bellows to the exhaust-passage, through a port in said exhaust-passage; a valve controlling said port; a pneumatic operating said valve; a pneumatic-passage leading from said pneumatic in said exhaust-passage to the outer air, having a pneumatic-port at the outer end thereof; an air-passage leading from the bellows to the outer air, having an air-port at the outer end thereof, the pneumatic-port and air-port being controlled by a single slide-valve which alternately opens and closes said ports; and means for operating said slide-valve by the collapse of the bellows, substantially as described.

4. In a pneumatic motor the combination with a bellows 2 of a driving-shaft 3, having bellows and valve-cranks 5; links 4 connecting the bellows 2 with said cranks; a bellows-passage 9 and valve-passage 8 leading from the bellows 2 to the exhaust-passage 6, through a port 7 in said exhaust-passage; a valve 12 controlling said port; a pneumatic 14 operating said valve; a pneumatic-passage 16 leading from said pneumatic in said exhaust-passage to the outer air, having a pneumatic-port 17 at the outer end thereof; an air-passage 10 leading from the bellows 2 to the outer air, having an air-port 11 at the outer end thereof, the pneumatic-port 17 and air-port 11 being controlled by a single slide-valve 18 which alternately opens and closes said ports; and the pitman 20 connecting the valve 18 with the driving-shaft 3, by means of which the valve 18 is operated by the collapse of the bellows 2, substantially as described.

5. In a pneumatic apparatus, a structure providing an exhaust-passage 6, a valve-passage 8 communicating with said exhaust-passage by the port 7 and a valve 12 controlling said port; a bellows-passage 9 communicating with said valve-passage; a pneumatic-passage 16 adapted to control a pneumatic in said exhaust-passage, said pneumatic-passage terminating in a pneumatic-port 17; an air-passage 10 having an air-port 11 and a single slide-valve controlling the ports 17 and 11, and means for operating said slide-valve, substantially as described.

809,920. **POST AND CARLINE FOR RAILWAY-CAR FRAMES.** WILLIAM P. KIESEL, Jr., Altoona, Pa. Filed June 27, 1905. Serial No. 267,234.



Claim.—1. In a car-frame, the combination, with a shaped metal post, of a carline formed as an integral cantaliver extension from the upper end thereof, the cantaliver at its base being of dimensions equal in strength with the post and gradually diminishing, as to said dimensions, as it bends toward the center of the car.

2. The combination, in a car-frame, of a shaped metal post, a lower-deck carline joined to the post in the form of an integral tapering cantaliver extension thereof, and an upper-deck carline smaller in cross-section than the post joined at its ends to the carlines projecting from opposite posts.

3. The combination, in a car-frame, of a post and carline formed in one piece of steel of U-shaped cross-section, the sides thereof being reinforced by outturned flanges along the legs of the U.

4. The combination, in a car-frame, of a post and carline formed in one piece of steel of U-shaped cross-section, the depth of the U

being gradually decreased where the carline bends toward the center of the car.

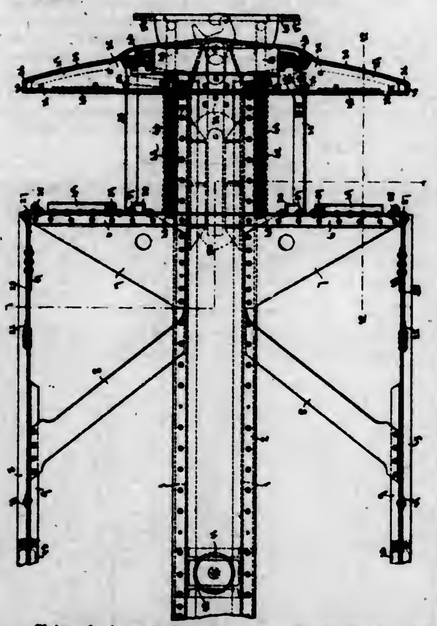
5. The combination, in a car-frame, of a post and lower-deck carline formed in one piece of steel of U-shaped cross-section, the carline portion tapering to smaller dimensions at its inward end, and an upper-deck carline similar in cross-section but of smaller dimensions than the post joined at its ends to the carline projecting from opposite posts.

6. The combination, in a car-frame, of a combined post and carline of steel pressed into U-shaped cross-section and a cover-plate riveted to the flanged side thereof.

7. The combination, in a car-frame, of a combined post and carline of steel pressed into U-shaped cross-section with inside and outside cover-plates riveted thereto.

8. The combination, in a steel car-frame, of channel side sills, posts of U-shaped cross-section riveted thereto at opposite sides of the car, lower-deck carlines formed by incurved extensions from said posts, longitudinal angle-bars riveted to the free ends of said carlines, and one-piece upper-deck carlines of U-shaped cross-section having their ends riveted to the longitudinal bars in line with the lower-deck carlines.

809,921. STEEL UNDERFRAME FOR RAILWAY-CARS. WILLIAM F. KIESEL, Jr., Altoona, Pa. Filed Aug. 23, 1905. Serial No. 275,269.



Claim.—1. An underframe for railway-cars comprising a center sill, center plates near each end upon which the center sill rests, and means for distributing and transferring the entire load of the superstructure to the center sill at points distant from the center plates.

2. An underframe for railway-cars constructed without body-bolsters and comprising a center sill in combination with end sills and intermediate cross-bearers so positioned as to distribute and transfer the entire load of the superstructure to the center sill.

3. An underframe for railway-cars constructed without body-bolsters and comprising a center sill in combination with center plates, end sills and intermediate cross-bearers so located relatively to one another that the entire load of the superstructure will be transferred by the end sills and cross-bearers to the center sill and so distributed that the stresses in the center sill over the center plates and near the center of the car will require practically the same section modulus throughout.

4. In an underframe constructed without body-bolsters, the combination of a center sill, cantaliver end sills projecting laterally from the center sill, cantaliver cross-bearers projecting laterally from the center sill intermediate the end sills, side sills joining the outer ends of the end sills and cross-bearers, and center plates attached to the center sill between the end sills and cross-bearers.

5. An underframe for railway-cars constructed without body-bolsters and comprising a box-girder center sill, center plates attached to the under side of the center sill near each end, end sills and intermediate cross-bearers projecting laterally from the center sill at points distant from the center plates and so spaced therefrom as to distribute and transfer the entire load of the superstructure to the center sill, and side sills joining the outer ends of the end sills and cross-bearers.

6. In an underframe, the combination, with a center sill, of an end sill comprising triangular plates flanged around the sides and projecting in vertical position from each side of the center sill, the upper side flanges of said plates being in horizontal alinement with the top of the center sill, and horizontal gusset-plates riveted to the upper flanges of said plates and to the top of the center sill.

7. In an underframe, the combination, with a center sill, of an end sill comprising vertical cantaliver-plates projecting from each side of the center sill, the upper sides of said cantalivers being in horizontal alinement with the top of the center sill, a transverse frame member passing across the center sill and riveted to the top of the cantalivers, and triangular gusset-plates riveted in horizontal position between the cantilivers and the transverse member and to the top of the center sill at each side thereof.

8. In an underframe, the combination of a center sill, end sills, intermediate cross-bearers, side sills joining the outer ends of the end sills and cross-bearers, oppositely-inclined diagonal braces between the center sill and side sills in the spaces between the end sills and cross-bearers, and triangular gusset-plates in the angles between the end sills and center sill.

9. In an underframe, the combination of a center sill, end sills, intermediate cross-bearers, side sills joining the outer ends of the end sills and cross-bearers, vertical side trusses spanning the spaces between the end sills and cross-bearers and also the central spaces between cross-bearers, of which trusses the side sills constitute the lower chords, and center plates attached to the center sill near each end between the end sills and cross-bearers.

10. In an underframe, the combination of a center sill, end sills, intermediate cross-bearers, angle-bar side sills joining the outer ends of the end sills and cross-bearers, vertical steel side trusses spanning the spaces between the end sills and cross-bearers and having the side-sill angle-bars for lower chords, wood sills resting in the angle of the angle-bar side sills, and wood side trusses spanning the central spaces between cross-bearers with the wood sills for lower chords.

11. In an underframe, the combination of a center sill, end sills, intermediate cross-bearers, angle-bar side sills joining the outer ends of the end sills and cross-bearers, oppositely-inclined diagonal braces extending out from the sides of the center sill and attached at their outer ends to reinforcing-angles on the inside of the side sills in the spaces between the end sills and cross-bearers, and transverse braces extending out from the sides of the center sill to the side sills in the spaces between the cross-bearers.

12. In an underframe, the combination of a center sill, cantaliver end-sill plates projecting out from each side thereof, angle-bar side sills having vertical limbs attached to the outer ends of said plates and outwardly-projecting horizontal limbs, and cantaliver cross-bearer plates projecting out from the sides of the center sill intermediate the ends, the horizontal limbs of the side sills resting upon and being secured to the outer ends of the cross-bearer plates.

13. In an underframe, the combination of a center sill, cantaliver end-sill plates projecting out from each side thereof and having their upper sides in horizontal alinement with the top of the center sill, angle-bar side sills having vertical limbs attached to vertical outer ends of the end-sill plates and outwardly-projecting horizontal limbs positioned below the level of the top of the center sill, and cantaliver cross-bearer plates projecting out from the sides of the center sill intermediate the ends, the upper sides of said cross-bearer plates being downwardly inclined and projecting beneath the horizontal limbs of the side sills at their outer ends.

14. In an underframe constructed without body-bolsters, the combination of a box-girder center sill, center plates attached to the bottom cover-plate thereof adjacent the ends, reinforcing-brackets inside the center-sill girder over the center plates, and cantaliver end sills and cross-bearers projecting out from the sides of the center sill at points to the front and rear of the center plates.

15. In an underframe constructed without body-bolsters, the combination of a box-girder center sill, center plates attached to the under side thereof, cantaliver end sills at each end beyond the center plates, cantaliver cross-bearers disposed at points between the center plates, side sills joining the outer ends of the end sills and cross-bearers, and oppositely-inclined diagonal braces between the center sill and side sills in the spaces at each side of the center plates.

16. In an underframe for railway-cars, a box-girder center sill extending from end to end of the car, platform end sills supported by the center sill at each end, and car-body end sills comprising vertically-disposed reinforced plates attached to and projecting from each side of the center sill back of the platform.

17. In an underframe for railway-cars, a box-girder center sill projecting beyond the car-body at each end, car-body end sills comprising vertical plates attached to and projecting from the sides of the girder, end castings projecting from the ends of the girder, and platform end sills carried by said castings.

18. In an underframe for railway-cars, a center sill projecting beyond the car-body at each end, car-body end sills projecting from the sides of the center sill, platform end sills supported by the projecting ends of the center sills, and longitudinal angle-braces between the car-body end sills and the platform end sills at each side of the center sill, said braces being so positioned as to act as top risers for the platform-steps.

19. In an underframe for railway-cars, a center sill projecting beyond the car-body, an end casting provided with lateral arms attached to the end of the center sill, a platform end sill supported by said arms, a car-body end sill projecting from the sides of the center sill, and longitudinal braces extending from said end sill to the arms of the end casting at each side of the center sill.

20. In an underframe for railway-cars, a box-girder center sill projecting beyond the car-body, an end casting secured between the vertical members of the girder and provided with laterally-projecting arms, cantaliver end sill plates projecting from the sides of the girder at the end of the car-body, angle brace-bars extending between the end sill-plates and the arms of the end casting, and a platform end sill carried by said arms.

21. In an underframe for railway-cars, a center sill projecting beyond the car-body, a car-body end sill carried thereby, a platform end sill supported at the end of the center sill, longitudinal brace-plates extending between the car-body end sill and the platform end sill at each side of the center sill and serving as risers for the top car-steps, and hanger-plates attached to both end sills to support the steps.

22. In an underframe for railway-cars, a box-girder center sill extending continuously from end to end of the car and an end casting attached thereto at each end, said castings being provided with laterally-projecting arms having guideways therein to receive the stems of a buffer-plate.

23. In an underframe for railway-cars, a box-girder center sill in combination with an end casting fastened between the vertical members thereof, said end casing having arms projecting at each side beyond the end of the center sill, guideways in said arms to receive the spring-stems of a vestibule buffer-plate, and a platform end sill suppotted by said casting.

24. The end casting 31 having arms 39 and guideways 45, substantially as herein described.

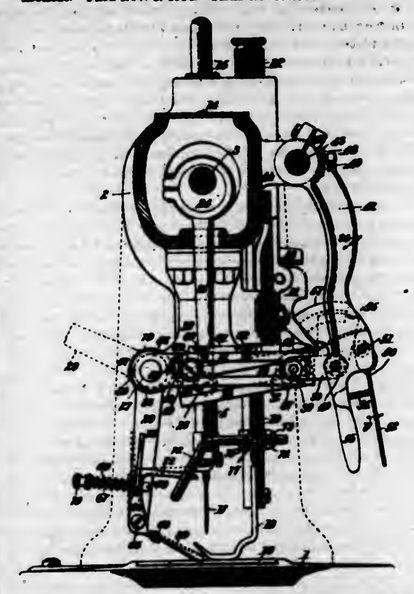
25. A platform end sill comprising a transverse horizontal plate, an end casting having laterally-projecting arms positioned beneath said plate, a vertical cover-plate passing around and secured to the end casting and to the horizontal plate, and means for attaching the end casting to the center sill of a car-underframe.

26. A platform end sill comprising the flanged horizontal plate 32, the end casting 31, and the vertical cover-plates 33 and 34 riveted around the sides thereof substantially as herein described.

27. In an underframe for railway-cars, the combination, with a box-girder center sill extending out under the car-platform and car-body end-sill plates projecting from the sides thereof, of an end casting riveted between the vertical members of the girder, lateral arms projecting from the end casting beyond the center sill, angle brace-bars extending out from the end-sill plates parallel to the center sill and fastened to said arms, a horizontal platform end-sill plate resting upon and riveted to center sill, end casting and brace-bars, and vertical cover-plates riveted to the sides of the platform and sill-plate at front and rear, the front cover-plate being also riveted to the arms of the end casting, and the rear cover-plates being riveted to the brace-bar.

28. In an underframe for railway-cars, the combination, with a center sill extending out under the car-platform and vertical car-body end-sill plates projecting from the sides thereof back of the platform, of a platform end-sill support at the end of the center sill, a vestibule buffer-plate, buffer-stems mounted in guideways on said support, said stems passing back at each side of the center sill through guides on the body end-sill plates, and springs on the stems between said plates and said support.

809,922. RUFFLING MECHANISM FOR SEWING-MACHINES. ALEXANDER LAMBERSEN, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed Nov. 8, 1904. Serial No. 231,883.



Claim.—1. The combination of stitch-forming mechanism including a needle-actuating shaft, a ruffling mechanism comprising rock-levers having separate pivotal supports, means to couple said levers adjustably to vary the throw of the crimping-blade, a connection between said coupled levers and the needle-actuating shaft by means of which said levers are rocked, a vibrating crimping-blade actuated by said levers, and a hand-lever connected with the means for coupling said rock-levers for controlling the extent of vibration thereof and suspending its vibration at will.

2. The combination of a stitch-forming mechanism including a needle-actuating shaft, a ruffling mechanism including a vibrating crimping-blade, a rock-shaft from which said crimping-blade derives motion, a lever on said shaft having a vibrating connection with the needle-actuating shaft, a spring-impelled hand-operated lever having a movable connection with the rock-lever, and a spring-catch on said hand-lever for engaging said rock-lever.

3. The combination of a stitch-forming mechanism including a needle-actuating shaft, and a ruffling mechanism including a crimping-blade, a vibrating lever upon which said blade is mounted, a rock-shaft supporting said lever, a rock-shaft-actuating lever, a connection between said actuating-lever and the needle-actuating shaft, and a hand-actuated lever connected with the rock-shaft-actuating lever and adapted to arrest the movement of said crimping-blade and also to change the amplitude of vibration of said crimping-blade at will.

4. The combination of a stitch-forming mechanism including a needle-actuating shaft, and a ruffling mechanism including a rock-lever, a connection between said rock-lever and the needle-actuating shaft whereby it is vibrated, a crimping-blade, a rock-shaft from which said crimping-blade derives motion, a lever on said rock-shaft, a shiftable coupling connecting this rock-shaft lever with the rock-lever, and a hand-lever linked to said coupling and adapted to move lengthwise of the levers to change the throw of the crimping-blade lever and also to arrest its movement without arresting the movement of the rock-lever connected with the needle-actuating shaft.

5. The combination of a stitch-forming mechanism including a needle-actuating shaft, and a ruffling mechanism including a vibrating crimping-blade lever, a rock-shaft on which said lever is mounted, a connection between said rock-shaft and the needle-actuating shaft by which the rock-shaft is actuated, and means to control the extent of movement or throw of the rock-shaft, comprising a slotted lever fixed to said shaft and coupled with the needle-shaft connection

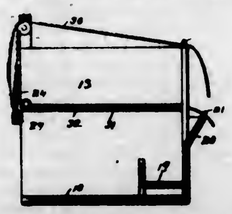
to derive motion from it, one or more stops on said slotted lever, a hand-lever, and a connection between said hand-lever and said slotted lever movable within said slotted lever to an extent limited by said stops.

6. The combination of a stitch-forming mechanism including a needle-actuating shaft, and a ruffling mechanism including a vibrating crimping-blade lever, a rock-shaft on which said lever is mounted, a connection between said rock-shaft and the needle-actuating shaft by which the rock-shaft is actuated, and means to control the extent of movement or throw of the rock-shaft, comprising a slotted lever fixed to said shaft and coupled with the needle-shaft connection to derive motion from it, a stop longitudinally adjustable in said slotted lever, a hand-lever, and a connection between said hand-lever and said slotted lever movable within said slotted lever to an extent limited by said stop.

7. In a ruffling mechanism for sewing-machines, a crimping-blade, a lever upon which it is mounted, a rock-shaft having a hub provided with holes, and a reduced axial extension, a hollow hub on said crimping-blade lever mounted on said extension, and provided with pins to engage the holes in the hub of the shaft, and a spring permitting longitudinal movement of the lever on the shaft and serving to hold the pins in engagement with the holes when said lever is adjusted into operative and inoperative positions, respectively.

8. The combination of a stitch-forming mechanism including a needle-actuating shaft, a cloth-feeding mechanism, a vibrating crimping-blade lever, a rock-shaft on which said lever is mounted, a connection between said rock-shaft and the needle-actuating shaft by which the rock-shaft is actuated, and means to control the operation and likewise the extent of throw of the rock-shaft, comprising a longitudinally-slotted lever fixed to said rock-shaft and coupled with the needle-actuating shaft connection, a hand-lever adjustably connected with the slotted lever, a catch on said hand-lever adapted to arrest the movement of the slotted lever and when released to permit a relative movement of the hand-lever and slotted lever, and a stop to limit the relative movement of the hand-lever and slotted lever.

809,923. **RETAINING-STALL FOR CALVES.** ALLEN A. LEWIS, Hanlon, Iowa. Filed Mar. 30, 1905. Serial No. 252,573.



Claim.—1. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining-bar at the rear of the partitions, a rope attached to said retaining-bar for raising the retaining-bar from its lower limit of movement, and a second rope secured to the retaining-bar and designed to draw the bar to its lower inner limit of movement.

2. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining-bar at the rear of the partitions, a rope attached to said retaining-bar for raising the retaining-bar from its lower limit of movement, and a retaining device at the forward end of one of the partitions for securing the rope in various positions.

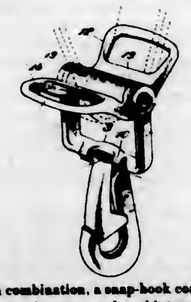
3. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining-bar at the rear of the partitions, a rope attached to said retaining-bar for raising the retaining-bar from its lower limit of movement, and a retaining device in front of one of said partitions for securing the second rope in position for retaining the retaining-bar at its lower inner limit of movement.

4. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining-bar at the rear of the partitions, a rope attached to said retaining-bar for raising the retaining-bar from its lower limit of movement, and a second rope secured to the retaining-bar and designed to draw the bar to its lower inner limit of movement, and a retaining device at the forward end of one of the partitions for securing the rope in various positions.

5. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining-bar at the rear of the partitions, a rope attached to said retaining-bar for raising the retaining-bar from its lower limit of movement, a second rope secured to the retaining-bar and designed to draw the bar to its lower inner limit of movement, a retaining device at the forward end of one of the partitions for securing the rope in various positions, and a retaining device in front of one of said partitions for securing the second rope in position for retaining the retaining-bar at its lower inner limit of movement.

6. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a series of pivotally-mounted supporting-rods attached to the rear of said partitions, a retaining device secured to the lower ends of said rods, a rope secured to said retaining device, passing over one of said partitions to the forward end of it, a retaining device for maintaining the rope in various positions, a second rope secured to said retaining-bar and passing through one of said partitions to a point in front of the partition, a retaining device for maintaining the rope in various positions, said ropes and retaining devices being designed to support and secure said retaining-bar in any position in its limit of movement.

809,924. **COMBINED HARNESS SNAP AND SLIDE.** JOHN RECHNEY, Racine, Wis. Original application filed Mar. 3, 1905. Serial No. 248,196. Divided and this application filed June 14, 1905. Serial No. 265,214.



Claim.—1. In combination, a snap-hook comprising a shank or hook portion having at its upper end, and integral therewith, the U-shaped cross-head comprising elongated upwardly-projecting arms with bearing-openings in their upper ends, a breast-strap slide having side ears pivotally confined to said arms, and an idler-roller arranged transversely of the slide and between said ears and rotating on an axis concentric with the axis of the pivotal connection between the slide and said arms.

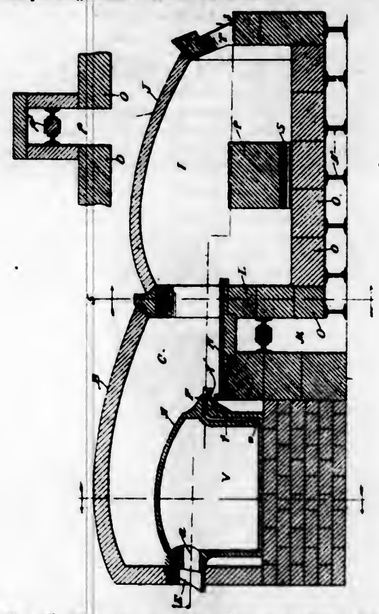
2. In combination, a snap-hook comprising a shank or hook proper at its upper end having a U-shaped cross-head comprising the elongated upwardly-extending arms, a slotted breast-strap slide pivotally joined to the upper ends of said arms which extend beside the side faces of said slide, and an idler-roller arranged transversely of said slide and forming the bottom strap-receiving surface thereof, substantially as described.

3. In combination, a slide having a bottom opening with cross-bars on opposite sides thereof, a hook having upwardly-extending arms, a rivet passing through the upper ends of said arms and through the sides of said slide and longitudinally of said opening, and an idler-roller on said rivet between the sides of the slide and said cross-bars, substantially as described.

4. A combined harness snap and slide, comprising a slide-frame having side walls and cross-bars between said side walls and spaced a distance apart, an idler-roller arranged between the side walls and cross-bars and forming the bottom strap-receiving surface of the slide, and a snap-hook having a top head pivotally connected with said side walls, substantially as described.

809,935. **GLASS-FURNACE.** SILAS G. RISBARDSON, Jr., Toledo, Ohio. Original application filed July 2, 1904, Serial No. 214,022. Divided and this application filed Apr. 20, 1905. Serial No. 256,559.

Claim.—1. A glass-furnace which comprises a heating-chamber and a plaining-chamber, in free communication with each other above the metal-line of the plaining-chamber, a melting-pot mounted in the heating-chamber, a metal-conduit leading from the outlet of the melting-pot into the plaining-chamber, said furnace being provided with an air-port interposed between the heating-chamber and the plaining-chamber, below said conduit.

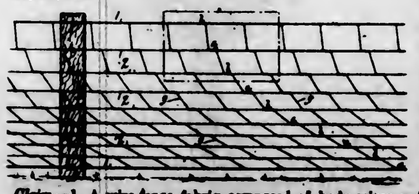


2. A glass-furnace, comprising a heating-chamber, a substantially closed melting-pot mounted in said heating-chamber, said pot being provided with a feed-port opening outside of said heating-chamber, and with an outlet-port discharging into the furnace, said furnace being also provided with a plaining-chamber, a conduit arranged to receive metal from said pot and to take it into said plaining-chamber, said furnace being also provided with an air-port interposed between the plaining-chamber and the heating-chamber, and below the level at which said conduit crosses said air-port.

3. In a glass-furnace, the combination with a heating-chamber, of a melting-pot mounted in said chamber and having a feed-in opening at one end and arranged to discharge into said heating-chamber, a plaining-chamber, means for conducting the product of said pot from the heating-chamber to the plaining-chamber, and means for passing the flame and gases through said heating-chamber and around said pot, so as to reduce the contents of said pot and maintain the fluidity of the contents of said plaining-chamber.

REISSUES.

12,434. **WIRE-FENCE FABRIC.** THOMAS LEYWILLER, Tremont, Ill. Filed Nov. 2, 1904. Serial No. 231,189. Original No. 769,228, dated Sept. 6, 1904.



Claim.—1. A wire-fence fabric, composed of body-wires and selvage-strands, of stay-wires extending obliquely across the body-wires from selvage-strand to selvage-strand and at each succeeding point of intersection with the selvage-strands and body-wires twisted therewith alternately over and under, substantially as specified.

2. In a wire-fence fabric, the combination of a series of body-wires, and stay-wires, extending obliquely across the body-wires from selvage to selvage, the twist of adjacent stays with corresponding body-wires being alternately over and under and having the twists measured along the body-wires in the same direction, substantially as specified.

3. In a wire-fence fabric, the combination of a series of body-wires and selvage-strands, stay-wires extending obliquely across the series of body-wires and twisted with adjacent body-wires alternately over and under, and adjacent stays twisted with corresponding body-wires alternately over and under and having the twists measured along the body-wires in the same direction, substantially as specified.

4. In a wire-fence fabric, the combination of a series of body-wires and selvage-strands, stay-wires extending obliquely across the body-wires from selvage to selvage and twisted with adjacent body and selvage wires, alternately over and under and having the twists of the stays and body-wires measured along the body-wires in the same direction, and short longitudinally-presented extensions of each stay where they are twisted with the selvage-strands, substantially as specified.

5. In a wire-fence fabric, the combination of a series of running-wires, of stay-wires bearing obliquely across the running-wires and twisted with the running-wires where they intersect, the twist of the stay-wires as they bear diagonally across the fabric from right to left being alternately over and under and having their twists uniform in a line bearing diagonally across the fabric from left to right, substantially as specified.

6. In a wire fence, the combination of a series of body-wires and selvage-wires, stay-wires intertwisted with the body-wires and selvage-wires and alternate stay-wires where they intersect with the body and selvage wires being intertwisted therewith alternately over and under, that portion of the body-wires where they intertwist with the stay-wires inclined slightly out of horizontal, while that portion of each body-wire intermediate each twist is inclined slightly out of horizontal but in an opposite direction to the incline of the twisted portion.

7. A wire fence, composed of body-wires and selvage-wires, of stay-wires extending across the body-wires from selvage-wire to selvage-wire and each stay at each succeeding point of intersection with the selvage and body wires twisted therewith alternately over and under, the stay-sections between the selvage and body wires bearing in oblique lines and always in advance of their twists with the lower selvage-wire and behind their twists with the upper selvage-wire, substantially as specified.

8. In a wire-fence fabric, the combination of running-wires, stay-wires extending obliquely across the running-wires, adjacent stay-wires where they intersect with corresponding running-wires twisted therewith alternately over and under both across the running-wires and measured along corresponding running-wires, substantially as specified.

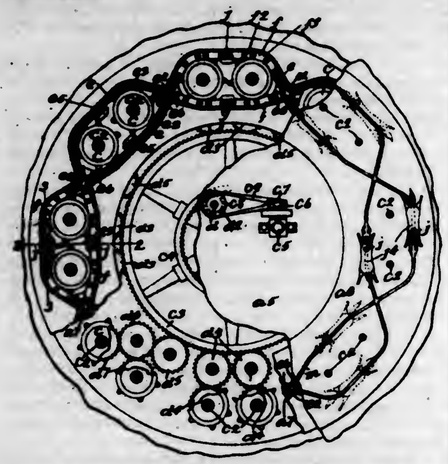
9. A wire fence, composed of body-wires and selvage-strands, of stay-wires extending obliquely across the body-wires from selvage-strand to selvage-strand and forming an arc between their ends, the said stays at each succeeding point of intersection with the selvage-strands and body-wires twisted therewith alternately over and under, substantially as specified.

12,435. **MERRY-GO-ROUND.** CHARLES F. WERNER, New York, N. Y. Filed Oct. 24, 1905. Serial No. 284,283. Original No. 773,549, dated Oct. 18, 1904.

Claim.—1. In an apparatus of the class described, the combination of a plurality of pairs of shafts arranged in a circle and provided with sprocket-wheels, devices operating in connection with said shafts for turning the alternate pairs of shafts in opposite directions, tracks or ways arranged at the opposite sides of the sprocket-wheels of the separate pairs of shafts and crossing each other between said pairs, a plurality of pairs of drive-chains arranged in said tracks or ways and equaling in number one-half the number of pairs of shafts, and vertically-arranged supports connected with said drive-chains, substantially as shown and described.

2. In an apparatus of the class described, a platform, a plurality of pairs of shafts passing vertically through said platform, sprocket-wheels connected with said shafts, means for turning the separate pairs of shafts in opposite directions, tracks or ways ar-

ranged at the opposite sides of the alternate pairs of shafts and crossing each other between said pairs, a plurality of pairs of drive-chains mounted in said tracks or ways and in connection with which said sprocket-wheels operate, and vertically-arranged rods connected with said chains and provided with supports, substantially as shown and described.



3. An apparatus of the class described comprising top and bottom portions, a plurality of vertical shafts arranged in pairs and the ends of which are mounted in said top and bottom portions, sprocket-wheels connected with the upper and lower ends of said shafts, tracks or ways at the opposite sides of the sprocket-wheels of each of said pairs of shafts in the top and bottom portions of the apparatus and crossing each other between said pairs, a plurality of pairs of drive-chains placed in said tracks or ways in the top and bottom portions of the apparatus and adapted to operate in connection with said sprocket-wheels, vertically-arranged rods connecting the bottom and top drive-chains, supports connected with said rods and means for turning the separate pairs of shafts in opposite directions, substantially as shown and described.

4. An apparatus of the class described, comprising a central drive-wheel, a plurality of pairs of shafts arranged in a circle around said drive-wheel, said pairs of shafts being geared in connection with said drive-wheels so as to be turned in opposite directions and being also provided with sprocket-wheels, tracks or ways arranged on the opposite sides of the sprocket-wheels of the separate pairs of shafts and crossing each other between said pairs, a plurality of pairs of drive-chains mounted in said tracks or ways and equaling in number one-half the pairs of shafts and sprocket-wheels, and vertically-arranged supports connected with said chains, substantially as shown and described.

5. In an amusement apparatus of the class described, endless tracks or ways which intercept each other at intervals, drive-chains of predetermined length movable in said tracks or ways, and devices for moving said chains in opposite directions in said tracks or ways, substantially as shown and described.

6. In an amusement apparatus of the class described, endless tracks or ways which intercept each other at intervals, drive-chains of predetermined length movable in said tracks or ways and devices for moving said chains in opposite directions in said tracks or ways, said chains being also provided with supports, substantially as shown and described.

7. In an amusement apparatus of the class described, a plurality of endless tracks or ways arranged to cross each other at intervals, drive-chains of predetermined length mounted in said tracks or ways, vertically-arranged supports connected with said drive-chains and means for moving said chains in opposite directions through said tracks or ways, substantially as shown and described.

8. In an amusement apparatus of the class described, a plurality of endless tracks or ways arranged in the same horizontal plane and crossing each other at intervals, chains of predetermined length mounted in said tracks or ways and provided with supports, and means for moving said chains in opposite directions through said tracks or ways, substantially as shown and described.

9. In an amusement apparatus of the class described, an endless irregular track or way, drive-chains of predetermined lengths mounted in said track or way, and means for moving said chains through said track or way, substantially as shown and described.

10. In an amusement apparatus of the class described, an endless irregular track or way, drive-chains of predetermined lengths mounted in said track or way, and means for moving said chains through said track or way, said chains being also provided with supports, substantially as shown and described.

DESIGNS.

37,777. BACK FOR BRUSHES, HAND-MIRRORS, AND SIMILAR ARTICLES. SIDNEY A. KELLER, New York, N. Y., assignor to Webster Company, North Attleboro, Mass., a Corporation of Rhode Island. Filed July 12, 1905. Serial No. 269,419. Term of patent 7 years.

Claim.—The ornamental design for a back for brushes, hand-mirrors and similar articles, as shown.

37,778. BACK OF HAND-MIRRORS OR SIMILAR ARTICLES. SIDNEY A. KELLER, New York, N. Y., assignor to Jacob Bernheim, New York, N. Y., trading as Woodside Sterling Company, a Firm. Filed Dec. 2, 1905. Serial No. 289,464. Term of patent 7 years.

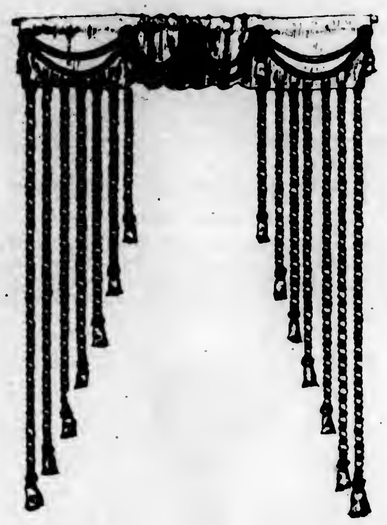
Claim.—The ornamental design for Levers lace as shown.

37,784. PORTIÈRE. MOSES HARBURGER, New York, N. Y. Filed Dec. 4, 1905. Serial No. 290,318. Term of patent 7 years.

Claim.—The ornamental design for a portière as shown.

37,785. PORTIÈRE. MOSES HARBURGER, New York, N. Y. Filed Dec. 4, 1905. Serial No. 290,319. Term of patent 7 years.



Claim.—The ornamental design for a portière as shown.

TRADE-MARKS

PUBLISHED JANUARY 9, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 186. FLAVORING EXTRACTS. JORDAN STABLER CO., Baltimore, Md. Filed Apr. 1, 1905. Used ten years.

STERLING

£

The word "STERLING" and a representation of the sign of the English pound-mark.

48,733. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a panel displaying a central rosette inclosed by a circle surrounded by a curved figure with four points extending to the ends and sides, the side points inclosing a conventional leaf-spray, while the end points inclose leaf designs with a rosette inclosed in a circle. The corners of the panels are filled by conventional sprays of leaves and flowers.

Filed June 27, 1905. Serial No. 9,230. PUBLISHED NOVEMBER 14, 1905.

48,734. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a panel with an outer line of dots and a conventional border of curved lines intertwined, within which is a rectangular line of dots inclosing a central panel displaying a conventional scroll design having on each side and at each corner a grotesque animal.

Filed June 27, 1905. Serial No. 9,231. PUBLISHED NOVEMBER 14, 1905.

48,735. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular design having a fan-like figure at each corner and a conventional block figure at each side. Surrounded by two lines which avoid the figures mentioned is a central device displaying sprays of leaves and at each end a shield showing three crowns.

Filed June 27, 1905. Serial No. 9,232. PUBLISHED NOVEMBER 14, 1905.

48,736. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel having two inclosing lines and displaying at the center a rosette within two circles. At each end and beside the central circular design is a leaf-like conventional scroll, and in the center of each end a grotesque human face appears.

Filed June 27, 1905. Serial No. 9,236. PUBLISHED NOVEMBER 14, 1905.

48,737. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel having a conventional border and displaying two stork-like figures with grotesque heads and long necks intertwined at the center and crossing a framework with a diamond center and lines extending therefrom to each side and end. In diagonally opposite corners are designs of four leaves inclosed by a small frame, and adjacent thereto is a somewhat larger frame. In the remaining corners are detached griffin-like wings. A number of small ball-like dots are scattered over the design.

Filed June 27, 1905. Serial No. 9,238. PUBLISHED NOVEMBER 14, 1905.

48,738. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD CO., New York, N. Y.

The representation of a panel having a conventional flower border surrounding an inner panel, at the center of which is a rosette inclosed by two concentric circles, between which is displayed a conventional flower-like band. At each end of the central device is a spray of leaves and flowers.

Filed June 27, 1905. Serial No. 9,239. PUBLISHED NOVEMBER 14, 1905.

48,739. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of two sea-serpents arranged about a circular device representing the rays from a strong light. The tail of each fish curves about a similar ray device at each end of the design. A curved line inclosing the entire design, following the contour thereof, but slightly overlapped at the ends and sides by the fins of the fish figures.

48,762. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

A device shown as upon a solid ground upon which are displayed certain framework, borders, scrolls, and floral designs. Within a central ring is a bunch of flowers consisting of two full-blown roses with leaves and small flora. The whole of the combined symbols form a quadrangular entablature, with corners slightly rounded, of greater length than width. Above and below the central ring appear similar floral designs, which partially overlap said ring and, extending laterally, form wreaths, which extend on either side to fleur-de-lis. The floral ornamentation, wreaths, and fleur-de-lis are surrounded with a plain-line border circular at its middle portion, but with Gothic arch-like extensions above and below, and this line border is surrounded by another line border following the inner configuration, except that it terminates in ornamental bends or turns on either side opposite to the fleur-de-lis. At each corner of the panel, within a quadrangular light line, the space is nearly filled up with floral designs, each of the same character.

Filed June 27, 1905. Serial No. 9,222. PUBLISHED NOVEMBER 14, 1905.

48,763. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a design many times repeated upon a panel or parallelogram to give the effect of many parallel diagonal lines crossing each other and inclosing dark diamond-shaped figures. The appearance of light lines is gained by four light parallel strokes or lines at each side of each dark diamond, and at each corner of each dark diamond a smaller light diamond space appears, the whole effect resembling a plaid design.

Filed June 27, 1905. Serial No. 9,226. PUBLISHED NOVEMBER 14, 1905.

48,764. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel having a conventional border suggesting fleur-de-lis and a conventional design in each corner. A central panel inclosed by two lines and an outer row of large dots displays a conventional scroll suggesting sprays of oak-leaves intertwined.

Filed June 27, 1905. Serial No. 9,228. PUBLISHED NOVEMBER 14, 1905.

48,765. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular device having a border of rosettes with larger corner-rosettes inclosing a central panel, upon which are displayed a number of fan-like figures resembling peacocks' tails so closely arranged as to cover the entire surface.

Filed June 27, 1905. Serial No. 9,229. PUBLISHED NOVEMBER 14, 1905.

48,766. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel displaying at the center a design of four egg-shaped figures with dotted borders, each containing a conventional oak-leaf spray. In each corner is a conventional scroll displaying an animal head.

Filed June 27, 1905. Serial No. 9,233. PUBLISHED NOVEMBER 14, 1905.

48,767. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel having a conventional border inclosing a central parallelogram displaying a leaf-like design starting from the center and spreading toward the ends, the leaves resembling oak-leaves. At each end is a vase of flowers, and in each corner is a cupid holding out in one hand a tiny representation of a playing-card.

Filed June 27, 1905. Serial No. 9,234. PUBLISHED NOVEMBER 14, 1905.

48,768. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a panel displaying at two corners a monkey having a very long tail twisted about the limbs of the opposite monkey. In each of the other corners are shown three wasp-like insects.

Filed June 27, 1905. Serial No. 9,235. PUBLISHED NOVEMBER 14, 1905.

48,769. PLAYING-CARDS. THE NEW YORK CONSOLIDATED CARD COMPANY, New York, N. Y.

The representation of a rectangular panel with an ornamental border inclosing a design consisting of four conventional scrolls of branches and leaves inclosing a central figure of four partial circles with a central rosette. In each corner is a bird perched upon the scroll and represented as singing.

Filed June 27, 1905. Serial No. 9,237. PUBLISHED NOVEMBER 14, 1905.

48,770. CHEMICALS FOR THE CERAMIC ARTS. THE ROESSLER & HASSLACHER CHEMICAL CO., New York, N. Y.

The representation of a heart-shaped shield having a flat top portion showing the letters and abbreviation "R H C Co" thereon with two bands below said letters, the character "A 1" appearing on said heart-shaped portion and two olive branches encircling said shield.

Filed May 23, 1905. Serial No. 6,370. PUBLISHED NOVEMBER 14, 1905.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

BEALL v. SHUMAN.

Decided October 28, 1905.

1. INTERFERENCE—ORIGINALITY—DERIVATION BY S. FROM B. THROUGH ANOTHER—EVIDENCE.

Where B. claims conception of the invention and disclosure to an associate of S. prior to S.'s alleged date of conception and is corroborated as to both matters by credible witnesses and the associate is discredited by his denial that the invention was so disclosed to him and the weight of circumstances is in favor of derivation by S. from B. through the associate, *Held* that the testimony of S. and the associate to independent invention by S. and the inference unfavorable to B. from inactivity in connection with the invention are overcome and that B. is entitled to an award of priority of invention.

2. SAME—SAME—EVIDENCE—SIMILARITY OF INVENTION AND OPPORTUNITY OF DERIVATION.

Held that the mere appearance of two parties with the same invention identical in many novel and distinct details raises some suspicion of derivation by one from the other, and where one of these parties is proved to have been in possession of the invention prior to any date of possession proved by the other party and it is shown that opportunity for derivation by the later party from the earlier party occurred prior to such proved date of possession by the later party the suspicion of derivation, in the absence of satisfactory evidence to the contrary, becomes conviction, and it must be held that the later party did, in fact, obtain the invention from the earlier party.

3. SAME—SAME—SAME—INACTIVITY OF PARTY—NOTICE OF ADVERSE CLAIM.

Where B. was not active in obtaining patents or in the reduction to practice and promotion of the invention which was carried on by S., but produces evidence in support of his claim that he supposed S. to be carrying out B.'s conception in the business of the common employer of B. and S., *Held* that in the absence of proof that B. in the period of his inactivity had notice of S.'s adverse claim no inferences strongly unfavorable to B. can be drawn from his inactivity.

4. SAME—EVIDENCE—DISCREPANCY BETWEEN TESTIMONY AND APPLICATION AS TO EXTENT OF THE INVENTION.

Where B. carefully omitted from his applications, prepared from S.'s patents, features of invention disclosed in the patents to S. and which B. in testifying claims to have invented, *Held* that the inference from these facts that B. did not originate the inventions in issue is too remote to stand against satisfactory evidence that B. did originate the invention in issue.

5. TESTIMONY—LEADING QUESTIONS.

Where some leading questions were asked in the course of the examination of witnesses, *Held* that their testimony as a whole was, nevertheless, sufficiently free from dependence upon the suggestion of counsel to be entitled to acceptance without diminution of weight on account of this objection.

APPEAL from Examiners-in-Chief.

REMOVABLE PILES FOR FORMING CONCRETE PILINGS.

Messrs. John B. Thomas & Co. and *Mr. W. S. Duvall* for Beall.

Messrs. Howson & Howson for Shuman.

ALLEN, *Commissioner:*

This is an appeal by Shuman from the decision of the Examiners-in-Chief awarding priority of invention to Beall upon an issue expressed in twenty-six counts, of which the following define the inventions involved sufficiently for the purposes of this decision:

1. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, the within-described removable preparatory pile having an enlarged point which is removable with the pile, substantially as specified.

2. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable preparatory pile having an opening extending through the point, whereby air can enter the space below the point as the pile is withdrawn, substantially as specified.

4. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable pile having an opening therein which extends through the point, and a valve which closes as specified.

6. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable pile having an enlarged point, and an opening through which air can enter the space below the point of the pile as the latter is withdrawn, substantially as specified.

7. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable preparatory pile having an opening therethrough and an enlarged point secured to said pile and also having a relief-opening therein through which air can enter the space below the point as the pile is withdrawn, substantially as specified.

17. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable preparatory pile having an enlarged point which is detachable from the pile, whereby said pile can be removed from the opening formed thereby, leaving the point at the bottom of the opening to form the base or foundation for the permanent pile, substantially as specified.

19. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable preparatory pile having a detachable non-metallic point, substantially as specified.

21. As a device for forming in the ground an opening for the subsequent reception of concrete or other fluid or plastic material, a removable preparatory pile having a detachable point composed of concrete, substantially as specified.

The inventions relate to the formation of concrete piles by driving a preparatory pile into the ground, withdrawing the same, and filling the opening formed with concrete. The counts are drawn to the removable preparatory pile and are limited to one or more of the various features thereof, such as an enlarged head for shattering the earth in driving to reduce friction in removal, the opening through the pile to admit air below the same and prevent suction during withdrawal, the valve for the air-opening at the point of the pile, and a detachable point or head for the pile, which remains in the ground as a base for concrete which is filled in upon the same.

Shuman claims to have conceived the inventions in issue and to have disclosed them to others in the first half of October, 1902, and to have reduced them to practice later in the same month. He applied for the patents in interference in January and in April of 1903, and the patents issued in July of that year. Beall claims to have conceived the inventions and to have disclosed them to others in the first

part of August, 1902. His applications in interference were filed in April, 1904. Beall alleges that Shuman is not an original inventor of the inventions in issue, but derived the same from Beall through Stewart, to whom Beall claims to have disclosed these inventions in August, 1902. As Shuman's patents issued before Beall's applications were filed, the burden is upon Beall to establish his case by proof beyond reasonable doubt. Both the Examiners-in-Chief and the Examiner of Interferences found Beall's conception of the invention and his disclosure thereof to others before Shuman's alleged date of conception to be proved. The Examiner of Interferences found that Beall disclosed the inventions to Stewart before Shuman's alleged conception thereof, that Shuman and Stewart were partners regarding these inventions, that derivation of the inventions by Shuman should be presumed from this relation, and that the judgment should be in favor of Beall. The Examiners-in-Chief found that Stewart had knowledge of Beall's invention prior to Shuman's alleged disclosure and that the Cranford Company (the employer of Beall and Stewart) reduced the invention to practice through Stewart and with the assistance of Shuman. They also awarded priority to Beall.

The conclusion of the tribunals below that Beall should prevail in this proceeding is, in my opinion, correct. It is not necessary to set forth here detailed consideration of the testimony. Full and careful analysis of the evidence is given in the decision of the Examiner of Interferences. The principal features of the case, as I view the same, may be stated, however. Beall testifies that he conceived the inventions on August 6, 1902, and made disclosures thereof the same day in part to Parsons (Q. 21, Beall's printed record, p. 22) and fully to Breniser, Davis, and Stewart. (Qs. 24–29, Beall's printed record, pp. 23–29.) The disclosure which is alleged to have been made to Parsons covers the subject-matter of some but not that of all of the counts of the issue; but the inventions claimed to have been explained to Breniser, Davis, and Stewart cover all of the counts. (Qs. 28 and 32, Beall's printed record, pp. 24 and 29.) Parsons testifies that Beall's disclosures to him were made substantially as alleged by Beall some time in August, 1902. (Qs. 12–14, Beall's printed record, p. 146.) Beall is corroborated in his allegations of full disclosure of the invention by Breniser (Beall's printed record, pp. 133 and 134, Qs. 26–33) and by Davis. (Beall's printed record, pp. 82 and 83, Qs. 17–25.) Both Breniser and Davis fix the time of these disclosures as when the trial piles were driven in the construction of the Stoneleigh Court foundations. (Beall's printed record, p. 131, Qs. 10–13; p. 81, Qs. 5–10.) That these piles were driven in August, 1902, is testified to by Brennan, (Beall's printed record, p. 163, Q. 7,) as well as by Parsons and Beall.

Beall stated on the stand that Stewart was present when the invention was disclosed to Breniser and Davis in August, 1902, and that the invention was fully explained to Stewart at that time. He also testified that Stewart suggested the preservation of secrecy in regard to the invention until Shuman, Stewart's brother-in-law and a professional inventor and patentee, could be consulted about it, and Beall says that he accepted these suggestions. (Beall's printed record, pp. 27 and 28.) Beall is corroborated in this by Breniser (Beall's printed record, pp. 136 and 137, Qs. 67, 68, 64, 67, 68) and by Davis. (Beall's printed record, pp. 81–85, Qs. 9, 15, 21, 28, and 22–26.) Stewart denies that the invention was disclosed to him by Beall; but no other direct evidence is offered to contradict the statement of Beall, Breniser, and Davis that it was so disclosed. The testimony of Beall, Breniser, and Davis was not weakened on cross-examination. Their reputation for veracity is unimpeached. Some leading questions were asked in the course of their examination; but their testimony, taken as a whole, is sufficiently free from dependence upon the suggestion of counsel to be entitled to acceptance without diminution of weight on account of this objection.

It is contended by Shuman that the evidence of conception of the invention by Beall and of Beall's disclosure to Stewart before Shuman's claimed date of conception is overcome by the evidence to the contrary which is found in Beall's conduct subsequent to his alleged conception and disclosure. Presumptions from conduct are often stronger than the direct testimony of witnesses; but in this case when all the circumstances are considered and the inferences deducible from the actions of both parties are weighed the prior conception of the invention and disclosure to Stewart alleged by Beall must, in my opinion, be regarded as established.

It is urged by Shuman that Beall did not show the interest in the reduction to practice and use of the invention which he should have shown had he in fact been the inventor thereof. Beall did not frequent the scene of the work where the invention was first put into practical operation. This work was done by the Cranford Company. It was carried on with Stewart as immediate superintendent and under the general supervision of Shuman. It was carried on throughout a period of several months; but Beall, like Stewart, was an employee of the Cranford Company. It appears that he was very busy with the work of the company during the practical development of the invention in parts of the city remote from the spot where this was being carried out. His position with the Cranford Company undoubtedly enabled him to keep posted on the general progress of the work in which the invention was being applied. It does not seem unreasonable to me, in view of all the circumstances and conditions, that Beall should have considered his work upon the invention to have ended with his disclosure thereof to Stewart and that he should have felt thereafter that he had only to await the reduction to practice by Shuman for the Cranford Company before the organization of a company by the Cranfords in which he would be benefited according to the proportionate value of his conception to the total efforts expended upon the invention. Shuman has not proved that Beall during the period of his inactivity had notice of Shuman's adverse claim, and in the absence of such proof no inferences strongly unfavorable to Beall can be drawn from such inactivity. The same explanation covers Beall's failure to press the invention personally upon the head of the Cranford Company or to take steps toward procuring patents until after the fact that Shuman's claim was adverse to his had been brought home to him.

Another matter urged in discredit of Beall's claim to original conception of the invention and disclosure thereof to Stewart is not so readily understood. Beall's applications, which were prepared from Shuman's patents and which follow the latter to a large extent word for word,

omit all reference to a distinct and important feature of the inventions disclosed by Shuman. Yet Beall testifies that this feature was included among his original inventions and that it was shown on a sketch which he claims to have made during the disclosure to Breniser, Davis, and Stewart and to have given to Stewart for Shuman's consideration shortly thereafter. This omission was evidently intentional in the preparation of Beall's applications. Beall claims that he supposed the feature in question to have been included in his cases and suggests that it was omitted through some misunderstanding upon the part of his attorneys. Though it is difficult to appreciate how so decided a misunderstanding could arise if ordinary care were used in describing the invention to the attorneys, I am still unable to find this matter sufficient to discredit Beall and the witnesses to his early conception of the invention and disclosure to Stewart. The inference that Beall did not have the inventions in issue in August, 1902, from the fact that he now claims to have also had at that time another different but allied invention, which was shown in the Shuman patent, but carefully excluded from Beall's patent, is too remote to stand against the direct evidence presented by Beall that he did have the invention in issue at that time.

The improbability of an inventor delivering a completely-conceived invention for development to a stranger, as Beall claims to have delivered his to Shuman, is also urged in discredit of Beall's case. Beall's conduct in this respect does not seem to me to be so remarkable when Stewart's position with the Cranford Company is considered. It was to Stewart that the invention is claimed to have been communicated by Beall, and it was through the Cranford Company that Beall would naturally expect to see his invention put into practical operation and made remunerative.

The single element of Beall's case remaining after proof of his conception of the invention and communication thereof to Stewart prior to Shuman's claimed date of conception is communication of the invention by Stewart to Shuman. The direct evidence upon this point is the testimony of Stewart and Shuman that the invention was not thus communicated, but was originated by Shuman upon suggestions by Stewart of the desirability of concrete piling. In finding the disclosure by Beall to Stewart proved it must be held that Stewart, who flatly denies such disclosure, is impeached. This leaves Shuman's testimony to original inventorship practically unsupported, and his unsupported testimony is of no weight against the strong presumption from the circumstances that the invention was derived by him from Beall through Stewart. The mere appearance of two parties with the same invention identical in many novel and distinct details raises some suspicion of derivation by one from the other, and where one of these parties is proved to have been in possession of the invention prior to any date of possession proved by the other party and it is shown that opportunity for derivation by the later party from the earlier party occurred prior to such proved date of possession by the later party the suspicion of derivation in the absence of satisfactory evidence to the contrary becomes conviction, and it must be held that the later party did, in fact, obtain the invention from the earlier party. Shuman lays much stress upon the absence of direct evidence of his derivation from Beall; but the indirect evidence found in Beall's earlier conception and disclosure to Stewart and in the close association between Stewart and Shuman at the time that Shuman claims to have conceived the invention supports the inference that the invention was, in fact, derived by Shuman from Beall, and this inference is only to be defeated by proof that the invention was not so derived by Shuman. Such proof for Shuman is wanting. Evidence that the invention was reputed to be Shuman's in the Cranford office and at the development thereof in the field was introduced; but this evidence is intrinsically of little value and is offset by evidence of the same kind that the invention was Beall's (Beall's printed record, p. 86, Qs. 49–52; p. 138, Qs. 76 and 77) and by the testimony of Cranford. Cranford is Shuman's witness. He is considerably interested in the company organized for the exploitation of Shuman's patents, (Shuman's printed record, pp. 250–252, Qs. 132–140;) yet the obvious conclusion from his testimony is that he had no satisfactory evidence in favor of the claims of either party when the controversy arose. (Shuman's printed record, p. 233, X-Qs. 37 and 38; p. 234, X-Qs. 49–58; p. 241, X-Qs. 88–92; p. 243, X-Q. 100; p. 245, X-Q. 106; p. 247, X-Qs. 117–120; p. 265, X-Qs. 202 and 203.)

I am satisfied that this case must be disposed of in favor of Beall on the more important portions of the entire mass of evidence, which have been already referred to. It may be mentioned, however, in addition to the matters already discussed, that Beall's case is also slightly strengthened by the general testimony to early possession of an invention in piling given by the witnesses Merriam and Mullett, while inferences unfavorable to Shuman's case must be drawn from his gratuitous distribution of stock to many employees of the Cranford Company, who became witnesses in this case, taken in connection with Stewart's letter stating that these gifts were made where it might become necessary to ask favors. (Shuman's printed record, p. 49, RD. Q. 149, p. 112, Qs. 76–78.) Inferences unfavorable to Shuman must also be drawn from Stewart's allegation of invention in concrete piling prior to Shuman's interest in this subject (Beall's printed record, pp. 157 and 158, Qs. 34 and 35; Shuman's printed record, p. 249, X-Qs. 126–131) and from the attitude taken by Stewart in his letter to Shuman of March 29, 1904, in which he proposes to divide stock equally with Shuman. (Shuman's printed exhibit of letters not printed in the record, p. 9.)

The decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority of invention to Beall is affirmed.

MCKEE *v.* BAKER.

Decided December 18, 1905.

1. INTERFERENCE—MOTIONS FOR DISSOLUTION—DELAY IN BRINGING—EXCUSES.

Where excuses offered for delay in bringing motion for dissolution do not cover the period in which the motion should have been brought or some of the subsequent period, but apply only to the latter portion of the subsequent period *Held* that the motion should not be transmitted.

2. SAME—SAME—SAME—SAME.

Where it is not shown that a party went diligently to work upon his case at the proper time to discover whether a motion for dissolution should be brought nor that he was prevented from making the necessary investigation and bringing the motion within the period fixed by the rules, *Held* that the motion should not be transmitted.

2. SAME—SAME—SAME—SAME.

The rule requiring motions to be brought within a fixed time is a wholesome one, and its enforcement requires that motions be not accepted when brought after the expiration of that time except where circumstances are shown which made it impossible to bring the motion within the regular period or under which the party could not reasonably be expected to have brought it therein.

ON PETITION.

CHARGING DEVICES FOR BLAST-FURNACES.

Mr. Jesse B. Fay for McKee.

Mr. P. T. Dodge for Baker.

ALLEN, *Commissioner:*

This is a petition by McKee to restore jurisdiction to the Examiner of Interferences to consider transmission of a motion for dissolution brought by McKee after the expiration of the time regularly fixed for bringing such motions.

An order was issued on June 22, 1905, pointing out that McKee had failed to allege in his preliminary statement a date of conception prior to the filing date of Baker and giving notice that judgment would be rendered against McKee unless he should show cause on or before July 12, 1905, why such action should not be taken. On July 15, 1905, the Examiner of Interferences found that cause had not been shown and rendered judgment of priority of invention in favor of Baker. The limit of appeal was fixed as August 4, 1905. On August 3, 1905, appeal was taken by McKee from the judgment against him upon priority to the Examiners-in-Chief. On October 25, 1905, McKee filed motions for dissolution and for transmission to the Primary Examiner. These motions were accompanied by a showing of reasons for the delay in bringing them and by this petition for restoration of jurisdiction to the Examiner of Interferences.

The reasons for the delay in bringing the motion are set forth in the affidavit of the attorney for McKee. It is alleged that upon August 24, 1905, McKee prepared an order for a copy of the file-wrapper and contents of Baker's application, but that the copy was not received until October 7, 1905, and that the time between the latter date and the filing of the motion was required for study of the case and preparation of the motion. The delay throughout the period from June 22, 1905, when McKee was required to show cause why judgment should not be entered against him, until August 24, 1905, when the order for a copy of Baker's application was prepared, is accounted for as follows: It is alleged that McKee placed a certain construction upon the claims in issue when suggested to him by the Primary Examiner and adopted them, but that later, at a time not appearing, after study of the prior art and conferences with persons versed in the art, he thought that the claims were anticipated and thereupon promptly secured an appointment with the Primary Examiner to obtain the views of the latter upon the question of anticipation. It is further alleged that the appointment was made for August 24, 1905, and that the interview was had upon that date and that the first order for a copy of Baker's application was prepared immediately thereafter.

The showing is entirely insufficient to excuse the delay prior to August 24, 1905. It is consequently unnecessary to pass upon the showing made for the delay subsequent to that date. The reasons given for the delay prior to August 24, 1905, are not of a compelling nature. It has not been shown that McKee went diligently to work upon his case upon receiving the order to show cause of June 22 to discover whether a motion for dissolution should be made, nor has it been shown that McKee was prevented from making the necessary investigation and bringing the motion for dissolution prior to July 12, 1905, the last day of the period in which the rules permit such motions to be filed as a matter of course. The rule requiring motions to be brought within a fixed time is a wholesome one, and its enforcement requires that motions be not accepted when brought after the expiration of that time except where circumstances are shown which made it impossible to bring the motion within the regular period or under which the party could not reasonably be expected to have brought it therein.

The petition is denied.

KLEPETKO v. BECKER.

Decided December 18, 1905.

1. INTERFERENCE—MOTIONS FOR DISSOLUTION—STATEMENTS OF FACTS—TRANSMISSION.

Where nothing in the statement of the facts upon which a motion to dissolve on the ground of irregularity in declaration was based is directed to anything other than the patentability of claims, the rights of the parties to make claims, or the identity in meaning of claims when read in the respective cases, *Held* that the motion was properly refused transmission as to this ground.

2. SAME—SAME—SAME—SAME.

Where no facts are alleged in support of a motion for dissolution on th ground of non-patentability except such as relate to the right of a party to make claims, *Held* that the motion was properly refused transmission as to the ground of non-patentability.

3. SAME—SAME—SAME—SAME.

In order to restrict, so far as possible, the labor of investigation and consideration on the part of the Office and on the part of the parties against whom motions for dissolution are brought to the exact matters by reason of which the moving party believes the interference should be dissolved, it is believed that the motion should set forth the specific facts relied upon to show that the interference should not continue.

4. SAME—SAME—SAME—SAME.

In setting forth facts in motions for dissolution the distinctions between the general grounds of dissolution which have been pointed out in *Woodward* v. *Nesston*, (86 O. G., 490,) *Owens* v. *Richardson*, (111 O. G., 1037,) and *Kecsander* v. *Hodges and Hodges* (118 O. G., 836) must be carefully observed. The observance of these distinctions is necessary to the logical presentation of the questions raised and to the avoidance of confusion in the matter of appeals.

5. SAME—SAME—SAME—SAME.

Where the motion does not state facts of such nature as might form proper basis for dissolution upon the general ground upon which the facts are alleged, the motion is not sufficiently clear and definite, and it should not be transmitted as to those grounds to which such objections apply.

APPEAL on motion.

ROASTING-FURNACE.

Mr. Emil Starck for Klepetko.

Mr. G. F. De Wein for Becker.

ALLEN, *Commissioner:*

This is an appeal by Klepetko from the decision of the Examiner of Interferences refusing to transmit to the Primary Examiner the motion of Klepetko for dissolution of the interference so far as said motion relates to the grounds of irregularity in declaration and non-patentability of counts 1 and 2 of the issue.

The motion alleges all of the grounds mentioned in Rule

122. The following statement is made of the facts upon which the contention of irregularity is based:

This irregularity consists in framing issues which, if truly expressing the construction shown by one party cannot at the same time truly express the construction of the opposite party; in forcing into the interference *issues* which express the construction of but one of the parties the determination of the question of priority of which could only affect one party to the interference and not the other; in forcing the parties to contest issues whose language is ambiguous and in which the terms "inlet" and "outlet" are used to express a relation which is at variance with the drawings illustrating the parties' inventions; in forcing the parties to contest an issue in which the *feed-pipe* of the junior party is made the equivalent of the *outlet-pipe* of the senior party; in that the Examiner has admitted into the interference the broad issues 1 and 2 without previously exhausting the citation against them of the best references at his command as provided by Rule 66, and ignoring the statutory requirement that an interference can only be declared between parties claiming the same "patentable" invention; that the Examiner's assumption that issues 1 and 2 are patentable in direct opposition to his record contention that issues 3 and 4 are not patentable (these issues having been allowed by the Board of Appeals) is unwarranted, and places him in the inconsistent attitude of allowing broad claims to one party after having denied narrow claims to the opposite party; that since an interference can, under section 4904 only be declared when "in the opinion of the Commissioner" one application interferes with another, it was incumbent on the Examiner to reject issues 1 and 2 and have the question of their patentability referred to the Examiners-in-Chief so that the same tribunal which had passed upon the patentability of a *part* of the issues, could pass upon the patentability of *all* of them.

I find nothing in this statement which is directed to anything other than the patentability of the claims in issue, the rights of the parties to make these claims, or the identity in the meaning of the claims when read in the applications of the respective parties. Such being the case, the Examiner of Interferences properly refused to transmit the motion as to the ground of irregularity in declaration. No facts are alleged in support of the allegation of the motion that the counts are not patentable except such as relate to the right of Becker to make the claims. The refusal to transmit the motion as to this ground was therefore also proper.

In order to restrict, so far as possible, the labor of investigation and consideration on the part of the Office and on the part of the parties against whom motions for dissolution are brought to the exact matters by reason of which the moving party believes the interference should be dissolved, it is believed that the motion should set forth the specific facts relied upon to show that the interference should not continue. This is deemed to be logical and proper extension of the practice initiated in *Vreeland* v. *Fessenden* v. *Schloemilch*, (117 O. G., 2633.) In setting forth such facts the distinctions between the general grounds of dissolution which have been pointed out in *Woodward* v. *Nesston*, (86 O. G., 490,) *Owens* v. *Richardson*, (111 O. G., 1037,) and *Kecsander* v. *Hodges and Hodges* (118 O. G., 836) must be carefully observed. The observance of these distinctions is necessary to the logical presentation of the questions raised and to the avoidance of confusion in the matter of appeals. Where the motion does not state facts of such nature as might form proper basis for dissolution upon the general ground upon which the facts are alleged, the motion is not sufficiently clear and definite, and it should not be transmitted as to those grounds to which such objections apply.

The decision of the Examiner of Interferences refusing to transmit the motion as to the grounds of irregularity in declaration and non-patentability of issues is affirmed.

WHITTINGHAM v. AUTOMATIC SWITCH COMPANY.

Decided December 18, 1905.

1. TRADE-MARK OPPOSITION—APPEAL UPON INTERLOCUTORY ORDER—PLEADINGS.

Where exception taken to applicant's answer on ground of impertinence was overruled by Examiner of Interferences, *Held* that no appeal from this action would be entertained.

2. SAME—SAME—SAME.

In overruling the exceptions to the answer the Examiner of Interferences denied to opponent no substantial rights, nor is it understood wherein opponent would be subjected to hardships by erroneous decisions of the Examiner overruling such exceptions sufficient to justify the general hardship in delay, labor, and expense which would be imposed upon parties by permitting interlocutory appeals in these cases.

ON PETITION.

MOTOR STARTERS AND REVERSERS.

Mr. Clifton V. Edwards for Automatic Switch Company.

Mr. Robert Watson for Whittingham.

ALLEN, *Commissioner:*

This is a petition from the action of the Examiner of Interferences overruling the exception taken by opponent to the answer of the applicant in the above-entitled opposition to registration of trade-mark.

The exception is based on the ground of impertinence. The matter alleged to be impertinent is pointed out, and it is prayed that the same may be expunged. The question was considered by the Examiner of Interferences, who found that portion of the matter excepted to was clearly relevant and that the remainder of such matter was not so clearly impertinent as to justify striking it from the record. He therefore overruled the exception, and the opponent brings this petition for review of that action.

It is a settled principle of procedure that no appeal will lie from an interlocutory order refusing to strike out parts of pleadings as redundant, irrelevant, or sham. (*8 Encyclopædia Pleading and Practice*, 112, note 5, and *2 American Digest, Century Edition*, sec. 704, a, b, n.) No reason appears why an exception to this principle should be made in cases of the class presented by this petition. In overruling such exceptions to answers the Examiner of Interferences denies to opponents no substantial rights, nor is it understood wherein opponents would be subjected to hardships by erroneous decisions of the Examiner overruling such exceptions sufficient to justify the general hardship in delay, labor, and expense which would be imposed upon parties by permitting interlocutory appeals in these cases.

Appeal dismissed.

EX PARTE WALTON.

Decided December 18, 1905.

ABANDONMENT OF APPLICATION BY FAILURE TO PROSECUTE—SUFFICIENCY OF AMENDMENT.

Where certain formal objections are raised and the claims are finally rejected, an amendment curing the formal objections will not save the case from abandonment, even though by curing the formal objections the scope of the claims is changed. A final rejection must be met by an appeal and not by an amendment changing the scope of the claims.

ON PETITION.

DESIGN FOR SECTIONAL HORSESHOE-PADS.

Mr. Albert L. Lawrence for the applicant.

ALLEN, *Commissioner:*

This is a petition from the decision of the Primary Examiner holding the case to be abandoned because of failure to make responsive action within the year allowed by law.

It appears that on October 15, 1903, certain formal objections were made and the claim was finally rejected. No further action was taken by applicant until the end of the year, when an amendment was filed curing the formal objections which had been raised. The Examiner then

held the case to be abandoned, on the ground that an amendment merely curing formal defects was not a proper response to an action raising formal objections and also finally rejecting the claim. From this action the applicant has brought this petition.

Petitioner contends that his action was responsive, because the amendment in the matters of form, which included a cancellation of a certain portion of the drawing, made the words of the claim mean something different from what they meant before, and that therefore such amendment changed the scope of the claim; but even admitting that this is true the action was nevertheless not such action as the condition of the case required. When claims are finally rejected and formal objections are made, the only proper action to take is to remove the formal objections and to file an appeal to the Examiners-in-Chief. Rule 68 of the Rules of Practice provides that claims cannot be amended in matter of substance after a final rejection, and this has been affirmed in a long line of decisions. It is clear, therefore, that an amendment changing the scope of the claims was not a proper response to a final rejection.

The Examiner's position is correct, and the petition is denied.

EX PARTE FITZHUGH.

Decided December 18, 1905.

PROSECUTION BY ASSIGNEES OF PART INTEREST—INVENTOR MISSING.

Where assignees of half interest petition for permission to prosecute the case, alleging that inventor has disappeared, and it appears that the inventor has a habit of absenting himself, and the application has not been acted upon by the Office, *Held* that the petition is premature and may be renewed in case it shall appear to be necessary to permit prosecution by the assignees to save the case from abandonment.

ON PETITION.

FEED-BOXES.

Mr. William L. Fitzhugh pro se.

ALLEN, *Commissioner:*

This is a petition by Iten and Elkins, assignees of one-half interest in the above-entitled application, that they be permitted to appoint an attorney to prosecute the case. The petitioners state that the inventor has disappeared and that they have been unable to communicate with him, though strenuous efforts have been made to do so. The petition is supported by affidavits stating that the inventor cannot be found. In one of these affidavits the affiant states that he is aware of the habit of the inventor in this case to absent himself for long periods of time without leaving any address where he may be communicated with regarding his applications for patent. This application has not yet received action by the Office. Action therein on the part of the applicant may properly be taken at any time within the year following the Office action. It may well be that the applicant intends to act in this case within that time, and no good reason appears for believing that he will not do so.

The petition must be denied at this time; but the assignees may renew the same in case it shall appear to be necessary that they be permitted to take action in the case to save the same from abandonment.

EX PARTE CASIN.

Decided December 18, 1905.

ABANDONMENT OF APPLICATION BY FAILURE TO PROSECUTE—APPLICANT BOUND BY ACTS OF ATTORNEY.

Where applicant's attorneys place the case in condition for final action and final action is given, the applicant cannot secure an extension of the time allowed by law by revoking the power of attorney and filing a request for further explanation, even though such request is filed within the year.

ON PETITION.

MANUFACTURE OF ELECTRIC INCANDESCENT LAMPS.

Mr. Francis M. F. Casin pro se.

ALLEN, *Commissioner:*

This is a petition from a decision of the Primary Examiner holding the case to be abandoned by failure of the applicant to take responsive action within the year allowed by law.

On May 23, 1904, division was required on certain specified lines, in response to which applicant filed an amendment relating to the description and claims and traversing the Examiner's requirement for division, setting forth certain reasons why the requirement was improper. In reply to this the Examiner on August 19, 1904, reconsidered the question of division in the light of the arguments presented and made the requirement final. It seems from an examination of the record that when reconsideration was asked applicant understood perfectly the Examiner's position on the question of division. The next action was a request that action be given on the merits of the claims in order that the question might be included in an appeal to the Examiners-in-Chief, which request was properly refused by the Examiner. The next letter received in the Office, July 31, 1905, was written by the applicant in person after having revoked the power of attorney formerly given by him. The case was not reached in the regular course of business until after August 19, 1905, the expiration of the year allowed by law, and as the said letter did not dispose of the questions previously raised the Examiner held it to be unresponsive and that the application was therefore abandoned. This letter of July 31, 1905, is very indefinite, being couched in very vague and uncertain language; but apparently its sole purpose was to raise a question as to the clearness of the Examiner's requirement. Whether or not the applicant could actually understand the requirement is deemed to be immaterial, because his attorney evidently understood the requirement when it was made in the first instance and when it was made final, and it may be observed that if applicant could not understand the requirement it was because of his lack of knowledge of the law and procedure and not because of the Examiner's failure to make his position clear; but in any event an applicant is bound by the acts of his attorney and cannot obtain an extension of the time allowed by law for action by dismissing his attorney and then asserting that the prior actions were not understood. If this were permitted, the prosecution of the case might be continued indefinitely.

The action of July 31, 1905, was clearly not responsive to the previous Office actions, and the application is therefore held to be abandoned. The petition is denied.

Drawings.

PRECAUTIONS TO BE OBSERVED IN FORWARDING DRAWINGS TO THE UNITED STATES PATENT OFFICE.

Where drawings are to be filed in connection with an application for Letters Patent in the United States Patent Office, each sheet, before it can be accepted by the Office as a part of the application, must be signed in the name of the inventor at the lower right-hand corner, either by him or by an attorney whose written authorization from the applicant is filed in connection with the application. This signature must also be attested by two witnesses, each of whom should sign the drawing at the lower left-hand corner of the sheet. The signatures should never be written on a line parallel with the longer edges of the sheet, one of the shorter edges being always regarded, for the purpose of locating the signatures, as the lower edge of the sheet. The signatures must all be within the margin-lines of the sheet and below the lines of the drawing. The title of the invention should be written with pencil on the back of each sheet of drawings.

When there are filed on the same day two or more applications by the same inventor, each of the documents and drawings belonging to the same application should have placed thereon the same letter or number, which should be different from the letter or number placed upon those of any other of the applications.

It is desirable that all parts of the complete application, including the drawings, be deposited in the Office at the same time. Should, however, the other parts of the application be filed before the drawings are sent, the latter when forwarded should be accompanied by a letter stating the number of sheets inclosed, and that the drawings are to be filed with the other parts of the application, giving the date at which such other parts were filed in the Office, the name of the inventor, and title of the invention. If the application has received a serial number, that should also be given, and it should be indorsed with pencil on the back of each sheet of drawings. The letter should also state, if such be the case, that the new drawings are to be substituted for those previously filed.

Drawings should be rolled—never folded—for transmission, and should be incased in a substantial mailing-tube.

Printed Copies of Patents.

A printed copy of the complete specification and drawings of any patent published herein can be obtained for five cents.

PATENTS

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business January 9, 1906.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	Under one month.			
303	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Jan. 2	Oct. 30	357
322	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Dec. 27	Dec. 1	234
378	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Dec. 27	Oct. 31	346
303	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Dec. 26	Oct. 10	340
154	XI. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Dec. 26	July 14	375
128	II. Bee Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Dec. 23	Sept. 28	204
321	I. Tillage, etc., Fences, and Railway Draft Appliances.	Dec. 22	Nov. 23	204
379	XXIII. Acoustics, Coin-Handling, Horology, Recorders, Registers, Optics, Signals, Time Controlling Mechanism.	Dec. 22	Aug. 28	612
304	XXXIV. Railways, Railway-Brakes, Rolling-Stock.	Dec. 20	Nov. 24	370

Trade-Marks.

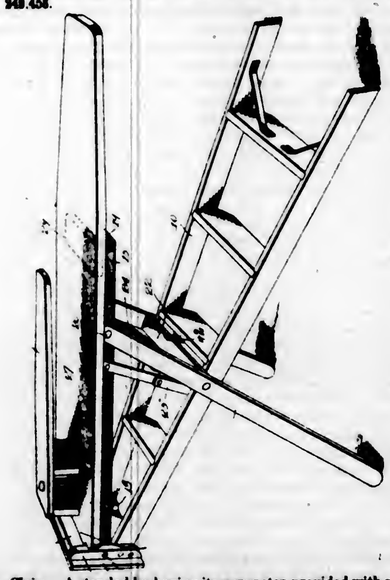
The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE, which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor.

PATENTS

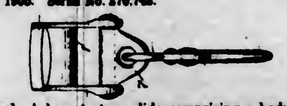
GRANTED JANUARY 16, 1906.

809,926. COMBINED STEP-LADDER AND IRONING-TABLE. ALPHEUS J. ALSPACH, Chicago, Ohio. Filed Mar. 10, 1905. Serial No. 249,458.



Claim.—A step-ladder having its upper step provided with a depending cleat, a supporting-leg pivotally connected to said step and formed in two sections pivotally united, the upper section being coupled to the step-ladder by jointed bars and the lower section having a transverse member for bearing upon the ladder portion and against said jointed bars when the lower section is partly collapsed, and an ironing-board for resting upon the upper section with one end bearing beneath said cleat.

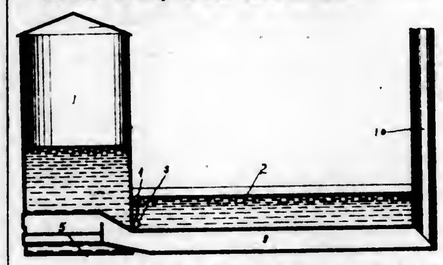
809,927. BREAST-STRAP SLIDE AND ATTACHMENT. JOHN S. ANDERSON, St. Louis, Mo., assignor to North & Judd Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed July 22, 1905. Serial No. 270,748.



Claim.—1. A breast-strap slide comprising a body having an arched portion 1, depending flanges 2 and 3, end pieces 4 and 5, a headed pivot-pin 6, and a solid or block 7 pivoted on said pin and having an eye with rounded edges for the swinging attachment of a snap-hook or other device.

2. A breast-strap slide comprising the combination of a body having an arched portion 1 and the side flanges 2 and 3, a pivot-pin 6 carried by the side flanges, a solid block 7 pivotally mounted on said pin, and a fastener having an eye 9 loosely hung in the eye of said block so as to permit it to swing freely back and forth and from side to side.

809,928. STOCK-WATERING TANK. WILLIAM BARBOUR, Oxford, Iowa. Filed Apr. 18, 1905. Serial No. 256,371.



Claim.—1. In a device of the character described a stock-watering trough, a water-reservoir adjacent thereto, a fire-box located near the bottom of said reservoir and a flue connected with the said fire-box passing under the said watering-trough.

2. In a device of the character described a stock-watering trough, a water-reservoir adjacent thereto and in communication therewith, a float-actuated valve controlling the flow of water from the reservoir to the trough, a fire-box located near the bottom of the said reservoir, and a flue connected with the said fire-box passing under the said watering-trough.

3. In a device of the character described a stock-watering trough, a water-reservoir adjacent thereto, a fire-box located near the bottom of said reservoir, and a flue connected with the said fire-box extending horizontally and arranged and adapted to heat the water in the said watering-trough.

4. In a device of the character described a stock-watering trough, a water-reservoir adjacent thereto and in communication therewith, a float-actuated valve controlling the flow of water from the reservoir to the trough, a fire-box located near the bottom of said reservoir and a flue connected with the said fire-box, adapted to convey the heated gases produced by the combustion in the fire-box adjacent to the water in the said watering-trough.

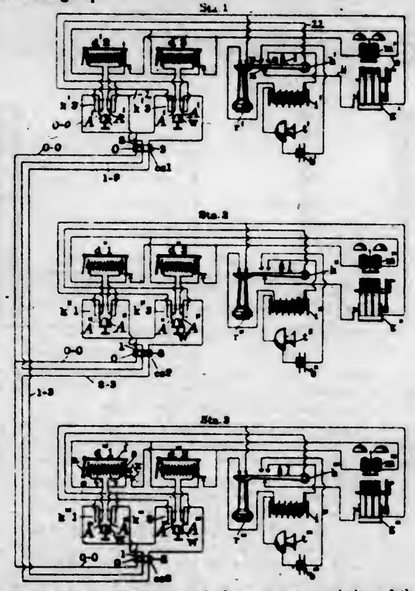
5. In a device of the character described a stock-watering trough, a water-reservoir adjacent thereto, a fire-box located near the bottom of said reservoir and a flue connected with the said fire-box adapted to convey the heated gases produced by the combustion in the fire-box adjacent to the water in the said watering-trough.

809,929. INTERCOMMUNICATION TELEPHONE SYSTEM. RICHARD M. BEARD, New York, N. Y. Filed Nov. 4, 1903. Serial No. 180,064.

Claim.—1. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, said interwiring comprising independent wires for respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations.

2. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a group of wiring for said telephone and sig-

nal-sending apparatus, located at each station, signal-receiving apparatus and a group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, said interwiring consisting of a common return-wire for all the stations, and independent wires respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations, said devices consisting of a switch, two of whose terminals are connected to said interwiring, two to one of said groups, and the remaining two to the other group.



3. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, said interwiring consisting of a common return-wire for all the stations, and independent wires respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations, said devices consisting of a switch, two of whose terminals are connected to said interwiring, two to one of said groups, and the remaining two to the other group, and a wedge for controlling the connections of all the terminals.

4. An intercommunication telephone system consisting of the combination of telephone and signal apparatus located, at each of three or more stations, a system of interconnecting lines comprising independent wires for connecting each station respectively with each one of the other stations, a system of local wiring for connecting up the apparatus at each station, which last-named system includes an independent balanced circuit for the telephone apparatus, and electric switches at each station for cutting in the said telephone apparatus at that station on any pair of wires, while maintaining it disconnected from any of the other pairs of wires, whereby when any two stations are telephonically connected, no other station can listen into either said two stations.

5. An intercommunication telephone system consisting of the combination of telephone and signal apparatus, located at each of three or more stations, a system of interconnecting lines comprising independent wires for connecting each station respectively with each one of the other stations, a system of local wiring for connecting up the apparatus at each station, said last-named system including an independent balanced circuit for the telephone apparatus, and electric switches at each station for cutting in the said telephone apparatus at that station on any pair of wires, while maintaining it disconnected from any of the other pairs of wires, whereby when any two stations are telephonically connected, no other station can listen in to either said two stations, said telephone apparatus consisting of a transmitter, receiver and induction-coil located at each of said stations, and an electric generator for supplying a current to said telephone apparatus, and said signal apparatus consisting of a single audible signal located at each of said stations, as many visual signals at each station, as there are stations less one, and an electric generator for operating said signal apparatus.

6. An intercommunication telephone system consisting of the combination of telephone, signal-sending and signal-receiving apparatus, located at each of three or more stations, a common return-wire for the apparatus at all the stations, and independent wires respectively connecting the apparatus at each one of the stations with the apparatus at each one of the remaining stations, two groups of local wiring at each station, keys at each station, each group of wiring being connected to a separate pair of contact-springs on the keys by an independent pair of wires, one group including the telephone and signal-sending apparatus, switching contacts located in and forming a part of the apparatus located in this last-named group, the other group being the signal-receiving group of wiring, and including visual signals and an audible signal, other switching contacts forming a part of each visual mechanism and operated thereby, the audible signal being connected in multiple with each visual signal through each pair of said switching contacts, whereby the audible signal may operate simultaneously with any one of the visual signals.

7. An intercommunication telephone system, consisting of a telephone instrument located at each of three or more different stations, signals at each station, a device at each station for operating the signals at each one of the other stations, a system of interconnecting lines comprising independent wires, for connecting the apparatus at each station respectively with the apparatus at each one of the other stations, and means at each station for including any of said apparatus in circuit with the interconnecting lines leading to any other station, said means, when connected for telephoning, including only the telephone instrument in said circuit, said telephone instrument being connected with said means in a balanced independent local circuit, while the signals alone are included in circuit with the wires leading to the other stations, whereby complete privacy is secured between any two or more telephones which are connected for telephoning and at the same time each busy station is maintained available to be signaled by other stations.

8. An intercommunication telephone system consisting of the combination of telephone, signal-sending, signal-receiving and switching apparatus, a system of interwiring connecting the above elements, said telephone apparatus consisting of a telephone instrument located at each of three or more stations, said signal-sending apparatus comprising a device at each of said stations for operating signals at any other station, said signal-receiving apparatus including signals at each station to indicate the station from which the signals are operated, and the said switching apparatus consisting of a means at each station for cutting in, either the said telephone apparatus at that station, or the said signal-sending apparatus, on any pair of wires, while maintaining it disconnected from any of the other pairs of wires, and for simultaneously cutting out the signal-receiving apparatus at the same said station from the said first-named pair of wires, and a balanced independent local circuit for the said telephone apparatus at each station and in which said telephone is wired to said means.

9. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring the said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus including a means for indicating the stations from which signals come, and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station.

10. An intercommunication telephone system consisting of the combination of telephone and signal apparatus, located at each of three or more stations, a common return-wire for all the stations, a single wire connection from each station to each other station, a system of local wiring for connecting up the apparatus at each station, said last-named system including an independent balanced circuit for the telephone apparatus, and electric switches at each station for cutting in the said telephone apparatus at that station on any one or more of the pairs of wires, while maintaining it disconnected from any of the other pairs of wires, whereby when any two or more stations are telephonically connected, no other station can listen in on the circuit connecting said two or more stations.

11. An intercommunication telephone system consisting of the combination of telephone and signal apparatus, located at each of three or more stations, a common return-wire for all the stations, a single wire connection from each station to each other station, a system of local wiring for connecting up the apparatus at each station, said last-named system including an independent balanced circuit for the telephone apparatus, and electric switches at each station for cutting in the said telephone apparatus at that station on any one or more of the pairs of wires, while maintaining it disconnected from any of the other pairs of wires, whereby when any two or more stations are telephonically connected, no other station can listen in on the circuit connecting said two or more stations, said telephone apparatus consisting of a transmitter, receiver and induction-coil located at each of said stations, and an electric generator for supplying a current to said telephone apparatus, and said signal apparatus consisting of a single audible signal located at each of said stations, as many visual signals at each station, as there are stations less one, and an electric generator for operating said signal apparatus.

12. An intercommunication telephone system consisting of the combination of telephone and signal apparatus, located at each of three or more stations, a common return-wire for all the stations, a single wire connection from each station to each other station, a system of local wiring for connecting up the apparatus at each station, and electric switches at each station for cutting in the said telephone apparatus at that station on the common return-wire and on any one or more of the single wires, while maintaining it disconnected from any of the other single wires, and for simultaneously cutting out the signal apparatus at the same station from the said first-named single wire or wires.

13. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to the signal-receiving group of wiring at one station, and then to the telephone and signal-sending group of wiring at the same station, said interwiring comprising independent wires for respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations.

14. An intercommunication telephone system consisting of the combination of telephone, signal-sending, signal-receiving and switching apparatus, a system of interwiring connecting the above elements, said telephone apparatus consisting of a telephone instrument located at each of three or more stations, said signal-sending apparatus comprising a device at each of said stations for operating signals at any other station, said signal-receiving apparatus including signals at each station to indicate the station from which the signals are operated, independent local circuits for the telephone apparatus and for the signal-receiving apparatus, a local circuit for the signal-sending apparatus in multiple with the telephone local circuit, the said switching apparatus consisting of a means at each station for cutting in either the said telephone apparatus at that station, or the said signal-sending apparatus, on any pair of wires, while maintaining it disconnected from any of the other pairs of wires, and for simultaneously cutting out the signal-receiving apparatus at the same said station from the said first-named pair of wires.

15. An intercommunication telephone system, consisting of the combination of telephone, signal-sending, signal-receiving and switching apparatus, a system of interwiring connecting the above elements, said telephone apparatus consisting of a telephone instrument located at each of three or more stations, said signal-sending apparatus comprising a device at each of said stations for operating signals at any other station, said signal-receiving apparatus including signals at each station to indicate the station from which the signals are operated, and the said switching apparatus consisting of a means at each station for cutting in the said telephone apparatus at that station on any one or more of the pairs of wires, while maintaining it disconnected from any of the other pairs of wires, and for simultaneously cutting out both the signal-sending and the signal-receiving apparatus at the same said station from the said first-named one or more pairs of wires.

16. An intercommunication telephone system consisting of the combination of telephone, signal-sending, signal-receiving and switching apparatus, a system of interwiring connecting the above elements, said telephone apparatus consisting of a telephone instrument located at each of three or more stations, said signal-sending apparatus comprising a device at each of said stations for operating signals at any other station, said signal-receiving apparatus including signals at each station to indicate the station from which the signals are operated, and the said switching apparatus consisting of a means at each station for cutting in, either the said telephone or signal-sending apparatus, or the said signal-receiving apparatus at that station, on any pair of wires, while maintaining it disconnected from any of the other apparatus at the same station, and when the said telephone apparatus is cut in on the said any pair of wires, maintaining it in a balanced local circuit.

17. In an intercommunication telephone system, two groups of local wiring at each station, keys at each station, each group of wiring being connected to a separate pair of contact-springs on the keys by an independent pair of wires, one group including the telephone and signal-sending apparatus, switching contacts located in and forming a part of the apparatus located in this last-named group, the other group being the signal-receiving group of wiring, and including visual signals and an audible signal, other switching contacts forming a part of each visual mechanism and operated thereby, the audible signal being connected in multiple with each visual signal through each pair of said switching contacts, whereby the audible signal may operate simultaneously with any one of the visual signals.

18. In an intercommunication telephone system between three or more stations, an organization of interconnecting lines comprising independent wires for respectively connecting any one of said stations with either one of the other stations, a telephone at each station and normally out of circuit, a balanced local circuit at each station and in which said telephone is maintained when connected with any of said interconnecting lines, and separate switches at each station, one for connecting each interconnecting line with the said telephone, and to connect any two telephones at different stations together over the corresponding interconnecting lines it being necessary to close two of said switches, one switch at the station calling and one switch at the station called, whereby, when any two or more of said stations are mutually connected together in a circuit for telephoning, no other station can connect in or listen on the last-named circuit.

19. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, said interwiring comprising independent wires, for respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations, said devices consisting of a switch, two of whose terminals are connected to said interwiring, two to one of said groups, and the remaining two to the other group.

20. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, said interwiring comprising independent wires, for respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations, said devices consisting of a switch, two of whose terminals are connected to said interwiring, two to one of said groups, and the remaining two to the other group, and a wedge for controlling the connections of all the terminals.

21. An intercommunication telephone system consisting of the combination of telephone, signal-sending and signal-receiving apparatus, located at each of three or more stations, a system of interconnecting lines comprising independent wires, for respectively connecting the apparatus at each one of the stations with the apparatus at each one of the remaining stations, two groups of local wiring at each station, keys at each station, each group of wiring being connected to a separate pair of contact-springs on the keys by an independent pair of wires, one group including the telephone and sig-

nal-sending apparatus, switching contacts located in and forming a

Claim.—1. In a tray-forming machine, the combination, with

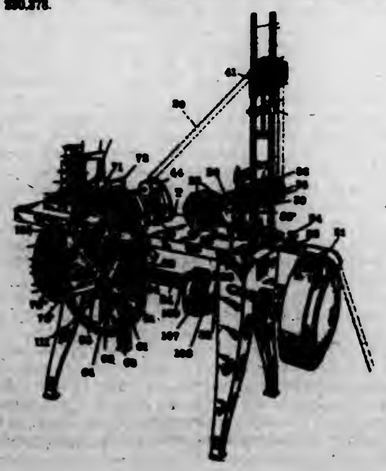
nal-sending apparatus, switching contacts located in and forming a part of the apparatus located in this last-named group, the other group being the signal-receiving group of wiring, and including visual signals and an audible signal, other switching contacts forming a part of each visual mechanism and operated thereby, the audible signal being connected in multiple with each visual signal through each pair of said switching contacts, whereby the audible signal may operate simultaneously with any one of the visual signals.

22. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, to either one of the said groups of wiring at one station and at the same time maintaining the interwiring between said any two stations disconnected from the other said group of wiring at the same station, said interwiring comprising independent wires for respectively connecting the apparatus at each one of the stations, with the apparatus at each one of the remaining stations.

23. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus including a means for indicating the stations from which signals come, and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to one group of wiring at one station, and then to the other group at the same station, and for disconnecting either of said groups of wiring from the interwiring between said any two stations when the other said group is connected thereto.

24. An intercommunication telephone system consisting of the combination of interwiring connecting three or more stations with one another, telephone apparatus at each station, signal-sending apparatus at each station, a separate group of wiring for said telephone and signal-sending apparatus, located at each station, signal-receiving apparatus and a separate group of wiring therefor at each station, and devices at the respective stations for electrically connecting the interwiring between any two stations, first to the signal-receiving group of wiring at one station, and then to the telephone and signal-sending group of wiring at the same station, and for disconnecting either of said groups of wiring from the interwiring between said any two stations when the other said group is connected thereto, said interwiring comprising independent wires for respectively connecting the apparatus at each one of the stations with the apparatus at each one of the remaining stations.

809,930. **BOX-TRAY-FORMING MACHINE.** JOHN H. RIGGS and JOHN H. RIGGS, Crawfordsville, Ind. Filed Oct. 26, 1904. Serial No. 230,276.



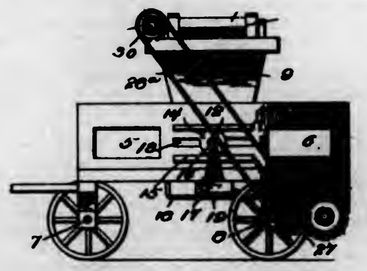
Claim.—1. In a tray-forming machine, the combination, with a tray-forming plunger and means for reciprocating the same, of a work-table having an aperture therethrough one dimension of which is slightly greater than the plunger, a pair of bending-levers arranged beyond the aperture and each provided with means for engaging the ends of the flaps upturned by passage through the aperture to bend said ends around the plunger, means for actuating said bending-levers, a pair of spring-pressed rollers arranged beyond the folding-levers and at right angles thereto upon opposite sides of the path of movement of the forming-plunger, a drying-wheel provided with a plurality of tray-receiving pockets, and means for bringing said tray-receiving pockets into successive alinement with the forming-plunger.

2. In a tray-forming machine, the combination, with a tray-forming plunger and means for reciprocating the same, of a work-table having an aperture therethrough one dimension of which is slightly greater than the plunger, a pair of bending-levers arranged beyond the aperture and each provided with means for engaging the ends of the flaps upturned by passage through the aperture to bend said ends around the plunger, each of said bending-levers being provided with a portion arranged to be engaged by the plunger during its forming movement to throw said bending-levers, a pair of spring-pressed rollers arranged beyond the folding-levers and at right angles thereto upon opposite sides of the path of movement of the forming-plunger, a drying-wheel provided with a plurality of tray-receiving pockets, and means for bringing said tray-receiving pockets into successive alinement with the forming-plunger.

3. In a tray-forming machine, the combination with a driving-shaft rotating in one direction and a tray-forming mechanism operated thereby, of a drying-wheel journaled on said shaft and provided with a plurality of tray-receiving pockets, said shaft tending to rotate the drying-wheel in the direction of its rotation, a catch for preventing rotation of the drying-wheel in that direction, and means for intermittently moving said drying-wheel angularly in the direction opposite to the rotation of the driving-shaft.

4. In a machine of the class described, the combination with a work-table, means for cutting material into desired blanks, means for forming said material, means for feeding the material to the work-table, and means for applying glue to the blanks, of a series of idlers over which the material is bent first in one direction and then in the other, the last of said idlers being arranged in conjunction with the work-table on the work side thereof whereby the final bend of the material gives it a tendency to move away from the work-surface of the table.

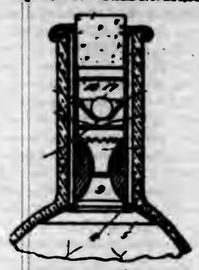
809,931. **BALING-PRESS.** JAMES L. COLEMON, Woolsey, Ind. Ter. Filed July 11, 1905. Serial No. 269,186.



Claim.—1. In a baling-press, in combination, a press-box having a middle receiving-chamber and end baling-chambers, the side walls of the middle chamber having slots, and tracks on the outside above and below said slots, a reciprocating plunger in the box having a bar projecting through said slots, rollers on the ends of the bar which travel on said tracks, and means connected to the ends of the bar to reciprocate the plunger.

2. In a baling-press, in combination, a press-box having a middle receiving-chamber and end baling-chambers, the side walls of the middle chamber being slotted, a reciprocating plunger in the box, having a bar projecting through the slots, a cross-head reciprocating under the box and having upwardly-projecting castings rigidly mounted thereon and connected to the ends of the bar, a crank-shaft extending across under the box, and a pitman connected to the crank-shaft and to the cross-head at the middle thereof.

809,932. **NON-REFILLABLE BOTTLE.** JAMES F. CONNELL, Belle, Kans. Filed Apr. 7, 1905. Serial No. 254,263.



Claim.—1. In an antirefilling bottle, the combination of the neck 1, the tube 3 insertible in the neck, an annular projection at the lower extremity of the tube, a flexible washer above said projection, means for preventing displacement of the tube, and valve means in the length of the tube.

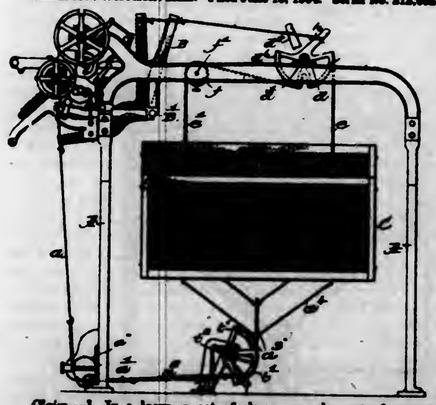
2. In an antirefilling bottle, the combination of the neck 1, the tube 3 insertible in the neck 1, the annular flange 4 at the lower extremity of the tube 3 and of substantially the diameter of the interior of the neck, a flexible washer secured to the tube above the annular flange and adapted to be clamped between the flange and the bottle as specified, means for preventing displacement of the tube, and valve means in the length of the tube 3.

3. In an antirefillable bottle, the combination of the neck thereof, a tube insertible in the neck and provided at its lower end portion with a projection, a washer fitted upon the tube and comprising a flexible disk adapted to hug the tube snugly as the same is forced into the neck, and to expand when said washer is received in the body of the bottle, the washer cooperating with the projection at the end of the tube to prevent displacement of said tube from the neck, and valve means in the length of the tube.

4. In an antirefilling bottle, the combination of the neck 1, the tube 3 insertible in the neck, the annular projection 4 at the lower extremity of the tube, the flexible washer 5, stop means at the upper extremity of the tube for preventing displacement thereof, and valve means in the length of the tube.

5. In an antirefilling bottle, the combination of the neck 1, the valve 10 in the length of the neck, a plate above the valve having an aperture therein, the valve being of hollow formation and having the outer end thereof open and arranged below the aperture in the aforesaid plate, a valve-plate above the apertured plate aforesaid and provided with a valve-opening above the aperture in said plate, and the valve 17 operating upon the valve-plate.

809,933. **HARNESS MECHANISM FOR LOOMS.** RANDOLPH CROMPTON, Worcester, Mass. Filed June 15, 1904. Serial No. 213,092.



Claim.—1. In a loom, a set of sheaves, and a set of sectors mounted above the harness-frames, straps directly connecting the sectors to one end of the harness-frames, and other straps passing over said sheaves and connecting the sectors to the opposite end of the harness-frames, said sectors having notched extensions with either notch of which may be engaged a part of the harness-connecting cords to thereby vary the extent to which any harness-frame may be raised.

2. In a loom, a set of notched harness-levers, a set of harness-frames, a series of sheaves, a series of sectors having notched extensions and disposed between said jacks and harness-frames, connections between said notched jacks and said notched sectors and adjustable in the notches of said jacks or sectors for the purposes set forth, and straps directly uniting the sectors to the harness-frames at one end, and other straps united with said sectors passed thence over said sheaves and joined to the harness-frames at their other end.

3. In a loom, a set of harness-jacks, a set of harness-frames, a series of sheaves and a series of sectors having notched extensions and disposed between the jacks and harness-frames, connections between the said extensions and jacks, and straps directly connecting the sectors to one side of the harness-frame and other straps passing over said sheaves and connected to the other side of said frame and the sectors.

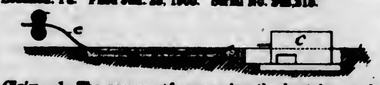
4. In harness mechanism for looms, a harness-frame, a harness-lever, another lever, a strap attached to one end of said frame and led directly to and connected with said other lever, a sheave, and a second strap attached to the opposite end of said harness-frame and led over said sheave and connected with said other lever.

5. In harness mechanism for looms, a harness-frame, a sector-lever mounted on the loom-frame over said harness-frame, a sheave sustained at the top of the loom-frame, two straps connected with such harness-frames near its opposite ends, each of said straps being united to said sector-lever, one of said straps being passed over said sheave whereby when said lever is moved in one direction, both said straps will be wound thereon and raise the connected harness-frame.

6. In harness mechanism for looms, a harness-frame, a sector-lever mounted on the loom-frame above said harness-frame, a harness-lever, means to connect said harness-lever with said sector-lever, a sheave, and straps connected with said harness-frame and with said sector-lever, one of said straps passing over said sheave, the ends of both said straps being wound on the lower sector-shaped end or part of said lever.

7. In a loom, a set of harness-frames, a set of sheaves, and a set of sectors mounted above the harness-frames, said sectors having notched extensions with either notch of which may be engaged a part of the harness-connecting cords to thereby vary the extent to which any harness-frame may be raised, a sector-lever located below the harness-frame and having notched extensions, and means connecting said extensions and harness-levers.

809,934. **WORKING ROLLED METALS.** JOHN V. CULLEN, Lebanon, Pa. Filed Jan. 23, 1905. Serial No. 242,215.



Claim.—1. The process of conserving the heat in metal bars while hot-working the same which consists in protecting the trailing portion thereof by means of a loose comminuted heat-conserving material.

2. The improvement in the process of hot-working rolled metals which consists in subjecting bars direct from the rolls to further progressive hot-working while trailing them through a comminuted heat-conserving material.

3. The improvement in the process of making rivets and the like from heated bars, which consists in passing the hot bars through a loose comminuted heat-conserving material while successively subjecting the forward portion thereof to the required forging treatment.

809,935. **CELLULOSE ACETATE.** ARTHUR HENRIQUES and THEODOR RECEUIL, Eberfeld, Germany, assignors to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed Feb. 20, 1903. Serial No. 144,326. (Specimens.)

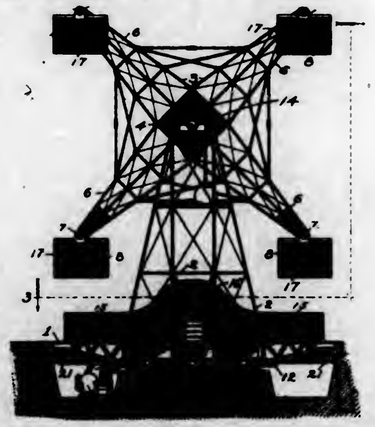
Claim.—The herein-described new cellulose acetate, characterized by being a derivative of cellulose, being soluble in hot alcohol of seventy per cent. and being produced by treating cellulose with a mixture of acetic anhydrid and sulfuric acid which is in a wet state a whitish voluminous mass and represents when dry yellowish hard lumps, the acetate being precipitated therefrom by the addition of much water in the shape of fine light flakes; the alcoholic solution solidifying in the cold to a gelatinous mass and being capable of

forming transparent flexible sheets and films by evaporation of its solutions, substantially as hereinbefore described.

809,936. BIT-BRACE JAW. REMBERT C. HALLECK, Southington, Conn., assignor to Peck, Stow & Wilcox Company, Southington, Conn., a Corporation of Connecticut. Filed Apr. 7, 1905. Serial No. 254,692.

Claim.—A bit-brace jaw comprising the two independent jaw members having their opposing surfaces longitudinally grooved and their rear ends transversely slotted, and a bowed spring, shaped to afford its spring action in the bow or curve, located wholly between said jaws with arms in said grooves, and the bow adapted to play through the slots in the rear ends of said jaws as said rear ends approach each other.

809,937. AMUSEMENT APPARATUS. SAMUEL M. FRIEDE, Chicago, Ill., assignor of one-half to Henry W. Carter, Chicago, Ill. Filed June 15, 1904. Serial No. 212,711.



Claim.—1. An amusement apparatus, comprising a rotary platform, a carrier mounted on a horizontal axis and supported over the center of said platform, observation-cars suspended from said carrier, means for rotating the platform, and means for rotating the carrier independently of the rotation of the platform, substantially as described.

2. An amusement apparatus, comprising a turn-table, means for maintaining the turn-table continuously in rotation, a carrier mounted on a horizontal axis approximately intersecting the vertical axis of the turn-table and supported centrally on said platform, observation-cars suspended from said carrier, a landing-place on the platform at which passengers may enter the cars, and means for rotating the carrier to bring the cars in succession to the landing-place, substantially as described.

3. An amusement apparatus, comprising a rotary platform, a carrier mounted on a horizontal axis and supported centrally on said platform, observation-cars suspended from said carrier, a landing-place on the platform, and means for giving independent rotary movement to the carrier to bring the cars in succession to the landing-place, substantially as described.

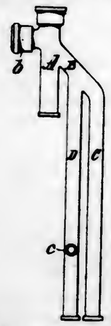
4. An amusement apparatus, comprising a rotary platform, towers rising from said platform, a rotary carrier mounted between said towers with its axis approximately over the center of the platform, observation-cars suspended from said carrier, means for rotating the platform, and means for giving intermittent rotary movement to said carrier independently of the rotation of the platform, substantially as described.

5. An amusement apparatus, comprising a rotary platform, a rotary carrier mounted upon a horizontal shaft supported over the center of the platform, observation-cars suspended from the carrier in pairs arranged back to back on opposite sides of the carrier and having outwardly-facing seats, means for rotating the platform, and means for giving intermittent rotary movement to the carrier independently of the rotation of the platform, substantially as described.

6. An amusement apparatus, comprising a rotary platform, a rotary carrier mounted upon a horizontal axis and supported over the center of the platform, observation-cars suspended from the carrier, and mirrors in the cars cutting off the view of the carrier and reflecting the open fronts of the cars, substantially as described.

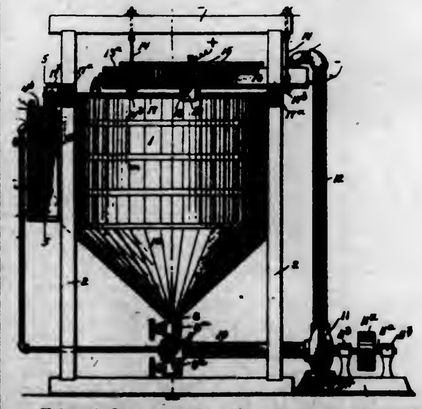
7. An amusement apparatus, comprising a rotary platform, towers rising from said platform, a rotary carrier mounted between said towers on a shaft supported approximately over the center of the platform, observation-cars suspended from said carrier a landing-place for the observation-cars located near the center of the platform at the foot of the tower, means for rotating the platform, and means for giving independent rotary movement to the carrier to bring the cars in succession to the landing-place, substantially as described.

809,938. COMBINED FITTING FOR CLOSETS AND SINKS. JOHN L. FRUDE, New York, N. Y. Filed Oct. 17, 1904. Serial No. 228,741.



Claim.—A combination-fitting for closets and sinks which consists of a body portion adapted to form part of a main vent-pipe, a downwardly-inclined lateral extension thereof and a number of vertical pipes opening downwardly therefrom of sufficient length to create an effective draft for reventing purposes; one of said vertical pipes serving as a revent for a closet and another of said vertical pipes having a side opening at some portion of its length, whereby said pipe is adapted to serve as a combined waste and vent for a sink bath-tub or washbasin.

809,939. APPARATUS FOR RECOVERING PRECIOUS METALS. EDWARD J. GARVIN, Portland, Oreg., assignor to Garvin Cyanide Extraction Company, a Corporation of Oregon. Filed June 16, 1905. Serial No. 265,485.



Claim.—1. In an apparatus of the class described, the combination with a main tank for receiving the pulverized ore and solvent, of a separating-tank including means for separating the material, attached to the main tank near its top, and an amalgamating-tank including means for amalgamating the material suspended above the main tank, and means for causing a continuous circulation of the materials and solution through said tanks.

2. In an apparatus of the class described, the combination with a main tank to receive the pulverized ore and the solution, of a separating-tank including means for separating the materials in communication with the upper portion of the main tank, an amalgamating-tank including means for amalgamating the material arranged to discharge into the main tank, means for drawing the lighter solution through the separating-tank from the main tank and for drawing the pulverized material from the main tank and mixing it with the solution drawn from the separating-tank and forcing such mixture into the amalgamating-tank, substantially as shown and described.

3. In an apparatus of the class described, the combination with a main tank to receive the pulverized ore and the solution, of a separating-tank in communication with the upper portion of the main tank, an amalgamating-tank arranged to discharge into the main tank, means for drawing the lighter solution through the separating-tank from the main tank and for drawing the pulverized material from the main tank and mixing it with the solution drawn from the separating-tank and forcing such mixture into the amalgamating-tank, means within the separating-tank for separating the metal from the solution and means within the amalgamating-tank for separating the metal from the solution and ore, substantially as shown and described.

4. In an apparatus of the class described, the combination with a main tank to receive the pulverized ore and the solution, of a separating-tank in communication with the upper portion of the main tank, an amalgamating-tank arranged to discharge into the main tank, means for drawing the lighter solution through the separating-tank from the main tank and for drawing the pulverized material from the main tank and mixing it with the solution drawn from the separating-tank and forcing such mixture into the amalgamating-tank, means within the separating-tank for separating the metal from the solution and means within the amalgamating-tank for separating the metal from the solution and ore, and means for agitating the amalgamating-tank, substantially as shown and described.

5. In an apparatus of the class described, the combination with a main tank for receiving the pulverized ore and the solution, of a separating-tank, said separating-tank having an inlet in communication with the main tank near the upper portion thereof, and having an outlet in the plane below the inlet of the separating-tank, a plurality of partitions within said separating-tank, said separating-tank having a concaved bottom, a rotatable cylindrical member mounted for rotation within the bottom of said separating-tank, said partitions adapted to be connected to the positive pole of a source of electric energy, said cylindrical member adapted to be connected to the negative pole of a source of electric energy, a valved offtake-pipe communicating with the outlet of the separating-tank, a pump in communication with said valved offtake-pipe of the separating-tank, a valved offtake-pipe for said main tank also in communication with said pump, an amalgamating-tank arranged to discharge into said main tank, a pipe connection from said pump adapted to discharge into said amalgamating-tank, and means within said amalgamating-tank for extracting the metal from the material therein by amalgamation, substantially as shown and described.

6. In an apparatus of the class described, the combination with a main tank for receiving the pulverized ore and the solution, of a separating-tank, said separating-tank having an inlet in communication with the main tank near the upper portion thereof, and having an outlet in the plane below the inlet of the separating-tank, a plurality of partitions within said separating-tank, said separating-tank having a concaved bottom, a rotatable cylindrical member mounted for rotation within the bottom of said separating-tank, said partitions adapted to be connected to the positive pole of a source of electric energy, said cylindrical member adapted to be connected to the negative pole of a source of electric energy, a valved offtake-pipe communicating with the outlet of the separating-tank, a pump in communication with said valved offtake-pipe of the separating-tank, a valved offtake-pipe for said main tank also in communication with said pump, an amalgamating-tank arranged to discharge into said main tank, a pipe connection from said pump adapted to discharge into said amalgamating-tank, and means within said amalgamating-tank, for extracting the metal from the material therein by amalgamation, and means within the separating-tank for extracting the metal from the solution within the tank by amalgamation, substantially as shown and described.

7. In an apparatus of the class described, the combination with a main tank for receiving the pulverized ore and the solution, of a separating-tank, said separating-tank having an inlet in communication with the main tank near the upper portion thereof, and having an outlet in the plane below the inlet of the separating-tank, a plurality of partitions within said separating-tank, said separating-tank having a concaved bottom, a rotatable cylindrical member mounted for rotation within the bottom of said separating-tank, said partitions adapted to be connected to the positive pole of a source of electric energy, said cylindrical member adapted to be connected to the negative pole of a source of electric energy, a valved offtake-pipe communicating with the outlet of the separating-tank, a pump in communication with said valved offtake-pipe of the separating-tank, a valved offtake-pipe for said main tank also in communication with said pump, an amalgamating-tank arranged to discharge into said main tank, a pipe connection from said pump adapted to discharge into said amalgamating-tank for extracting the metal from the material therein by amalgamation, and means within the amalgamating-tank for electrolytically extracting the metal from the material within the tank substantially as shown and described.

8. In an apparatus of the class described, a main tank or receptacle, a separating-tank having separating means in communication with the main tank near its top, and an amalgamating-tank having means for amalgamating the material, suspended above the main tank, said main tank adapted to receive ore and solvent, said ore and solvent adapted to separate in said main tank into lighter and heavier strata to permit drawing off the heavier strata and the lighter strata separately, means for drawing off the contents of the main tank, circulating, agitating and passing the lighter strata through the precipitating or separating tank and returning the same to the heavier strata, while simultaneously drawing the heavier strata from the bottom of the main tank and passing it back into the amalgamating-tank, substantially as shown and described.

9. In an apparatus of the class described, the combination with a main tank adapted to receive the ore and the solvent, said ore and solvent adapted to separate into lighter and heavier strata in said main tank, a separating-tank in communication with said main tank at a point in line with the lighter material, means within said separating-tank for separating the metal from its solution, means for drawing off the spent solvent from the separating-tank after the metal has been separated therefrom, and for drawing off the heavier material from the main tank and mixing said spent solvent with said heavier material to cause it to dissolve said heavier material and for forcing said solution of heavy material and solvent back into the main tank, substantially as shown and described.

10. An apparatus of the class described, a main tank adapted to receive the ore and solvent, a separating-tank having an inlet in communication with the main tank at a point near its top, means within said separating-tank for separating the ore from its solution as the solution passes therethrough, an outlet for said separating-tank, an outlet for said main tank near the bottom thereof, a pipe connected with the outlet from the separating-tank and the lower outlet from the main tank to receive the discharged materials from the main tank and the separating-tank, an amalgamating-tank arranged above the separating-tank and adapted to discharge into said separating-tank, means connected with said pipe which receives the discharge from the main and separating tanks for forcing the combined materials into the amalgamating-tank, and means in the amalgamating-tank for separating the metal from its ore and solution, substantially as shown and described.

11. An apparatus of the class described, a main tank adapted to receive the ore and solvent, a separating-tank having an inlet in communication with the main tank at a point near its top, means within said separating-tank for separating the ore from its solution as the solution passes therethrough, an outlet for said separating-tank, an outlet for said main tank, near the bottom thereof, a pipe connected with the outlet from the separating-tank and the lower outlet from the main tank to receive the discharged material from the main tank and the separating-tank, an amalgamating-tank arranged above the separating-tank and adapted to discharge into said separating-tank, means connected with said pipe which receives the discharge from the main and separating tanks for forcing the combined materials into the amalgamating-tank, means in the amalgamating-tank for separating the metal from its ore and solution, and means for agitating said separating-tank.

12. An apparatus of the class described, a main tank adapted to receive the ore and solvent, a separating-tank having an inlet in communication with the main tank at a point near its top, means within said separating-tank for separating the ore from its solution as the solution passes therethrough, an outlet for said separating-tank, an outlet for said main tank near the bottom thereof, a pipe connected with the outlet from the separating-tank and the lower outlet from the main tank to receive the discharged materials from the main tank and the separating-tank, an amalgamating-tank arranged above the separating-tank and adapted to discharge into said separating-tank, means connected with said pipe which receives the discharge from the main and separating tanks for forcing the combined materials into the amalgamating-tank, means in the amalgamating-tank for separating the metal from its ore and solution, said means for separating the metal from its solution into the separating-tank comprising an amalgamating material, and electrolytic separating devices.

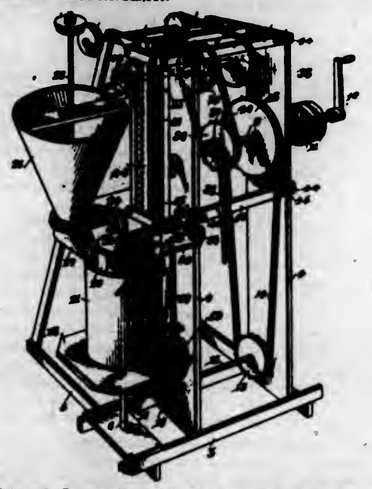
13. An apparatus of the class described, a main tank adapted to receive the ore and solvent, a separating-tank having an inlet in communication with the main tank at a point near its top, means within said separating-tank for separating the ore from its solution as the solution passes therethrough, an outlet for said separating-tank, an outlet for said main tank near the bottom thereof, a pipe connected with the outlet from the separating-tank and the lower outlet from the main tank to receive the discharged material from the main tank and the separating-tank, an amalgamating-tank arranged above the separating-tank and adapted to discharge into said separating-tank, means connected with said pipe which receives the discharge from the main and separating tanks for forcing the combined materials into the amalgamating-tank, means in the amalgamating-tank for separating the metal from its ore and solution, said means for separating the metal from its solution into the separating-tank comprising an amalgamating material and electrolytic separating devices, and said separating means within the amalgamating-tank comprising an amalgamating material and supplemental electrolytic devices substantially as shown and described.

14. An apparatus of the class described comprising in combination a supporting-frame, a main tank mounted thereon said tank having a conical bottom and a valved outlet, a junction member into which said valved outlet of the main tank discharges, a valved off-take for said junction member, a separating-tank mounted on said supporting-frame and having an inlet in communication with the main tank near its top and an outlet at a point below its inlet, said separating-tank having its sides provided with a plurality of grooves, a plurality of metal plates held in said grooves and forming anodes, a cathode mounted in said separating-tank below said anodes, said cathode comprising a cylindrical member consisting of end disks, metallic strips connecting said end disks together, said cathode being rotatably mounted in said separating-tank, said separating-tank having a concaved bottom adapted to receive mercury to cover the lower portions of said cathode, a valved pipe connection communicating with said junction member and the outlet of said separating-tank, an amalgamating-tank loosely mounted on said supporting-frame above said main tank and having a discharge-outlet adapted to discharge into said main tank, said amalgamating-tank having its sides provided with grooves, a plurality of metallic plates held in said grooves to form anodes, the lower edges of said plates being held in a plane below the upper edge of the outlet of said amalgamating-tank to form a trap, a metal plate within said amalgamating-tank below said last-named plates and forming a cathode, said amalgamating-tank adapted to contain mercury, a pump in connection with said junction member, and arranged to pump the material from said junction member into said amalgamating-tank, and means mounted on the supporting-frame and in connection with the amalgamating-tank for agitating the same, substantially as shown and described.

15. In an apparatus of the class described, the combination with a main tank adapted to receive ore and solvent to permit the same to separate into lighter and heavier strata, a separating or precipitating tank in communication with said main tank at a point in line with the lighter material, and an amalgamating-tank arranged to discharge into the main tank, means within said separating-tank for separating the material from its solution, means for drawing off the spent solvent from the separating-tank after the metal has been separated therefrom, and for drawing off the heavier material from the main tank to mix the spent solvent with the heavier material and for forcing said mixture of solvent and heavy material back into the amalgamating-tank and into the main tank, all being arranged substantially as shown and described.

16. In an apparatus of the class described, the combination with a separating-tank, an amalgamating-tank and a main tank adapted to receive ore and solvent which is adapted to separate into lighter and heavier strata during the process of agitation or circulation in said main tank for separating the solvent from ore, to pass the same through the separating or precipitating tank at a point in line with the lighter material, means within said separating-tank for separating the material from its solution, means for drawing off the spent solvent from the separating-tank after the metal has been separated therefrom, and after drawing off the heavier material from the main tank to mix the spent solvent therewith and for forcing said mixture of heavy material and ore back into the amalgamating-tank and into the main tank, substantially as shown and described.

809,940. **TILE-MOLDING MACHINE.** ALLEN GLEED, Scranton, Iowa, assignor of one-half to Silas G. Kinne, Scranton, Iowa. Filed Jan. 27, 1905. Serial No. 242,917.



Claim.—1. In a machine of the class described, the combination with a rotatable mold-supporting table, of movable means for feeding material to a mold placed on the table, driving means, gearing connecting the driving means and table, and gearing connecting the driving and feeding means, said gearing including a clutch that permits the rotation of the mold-supporting table independently of the feeding means.

2. In a machine of the class described, the combination with a rotatable mold-support, of a movable tamping device coacting with the table, driving means, gearing connecting the driving means and table, and gearing connecting the driving means and tamping device, said latter gearing including a clutch whereby the tamper can be stopped while the table will continue to revolve.

3. In a machine of the class described, the combination with a rotatable mold-support, of movable means for feeding material to a mold placed on the support, driving means, gearing connecting the driving means and support, gearing connecting the driving and feeding means, said gearing including a clutch whereby the feeding means may be stopped while the support continues to revolve, and means normally stationary with respect to the support and coacting with the mold placed thereon for finishing an article in said mold.

4. In a machine of the class described, the combination with a rotatable mold-support, of a movable tamping device coacting therewith, driving means, gearing connecting the driving means and support, gearing connecting the driving means and tamping device, said latter gearing including a clutch by means of which the tamping device can be stopped and the support rotated independently of the movement thereof, and means coacting with a mold placed on the support for finishing an article made in such mold, said means being normally stationary with respect to the support.

5. In a machine of the class described, the combination with a supporting-frame, of a rotatable table, a driving-shaft, gearing connecting the driving-shaft and table for rotating the latter, feeding means including a rotatable agitator, a reciprocatory tamper, gearing connecting the driving-shaft and the tamper and agitator, said gearing including a clutch by means of which the tamper and agitator can be stopped and the table rotated independently thereof, a mold detachably supported on the table, and a finishing-scraper movably mounted on the supporting-frame and coacting with the mold.

6. In a machine of the class described, the combination with a supporting-frame, of a rotatable mold-supporting table, a guide, bars disposed transversely of the guide and frame and having a longitudinal sliding engagement with one of the same to permit the adjustment of the guide toward and from the axis of rotation of the table, and means for holding the bars against such movement to hold the guide in different positions with respect to the axis of rotation of the table.

7. In a machine of the class described, the combination with a supporting-frame, of a rotatable mold-supporting table, a guide, holding-bars secured to the guide and slidable longitudinally of the supporting-frame to carry the guide toward and from the axis of rotation of the table, and bolts for clamping the bars against movement to the frame to hold the guide against movement.

8. In a machine of the class described, the combination with a reciprocatory tamper, of means for reciprocating the tamper, said means including a device that engages the tamper, and means permitting the relative lateral movement between the tamper and device when the same are in engagement with each other.

9. In a machine of the class described, the combination with a reciprocatory tamper, of driving means for reciprocating the tamper, said means including a device that engages the tamper, and means for yieldingly maintaining the device and tamper in positions to coact, said yielding means permitting the movement of the driving means independently of the tamper.

10. In a machine of the class described, the combination with a reciprocatory tamper having a rack, of means for reciprocating the tamper, said means including a rotatable mutilated gear that meshes with the rack, and means for yieldingly maintaining the rack and gear in position to coact, but permitting the movement of the latter independently of the former.

11. In a machine of the class described, the combination with a reciprocatory tamper having a rack, of means for reciprocating the tamper, said means including a gear having yieldingly-projected teeth.

12. In a machine of the class described, the combination with a reciprocatory tamper having a rack, of means for reciprocating the tamper, said means including a mutilated gear having a tooth-segment yieldingly supported thereon and arranged to mesh with the rack.

13. In a machine of the class described, the combination with a reciprocatory tamper having a rack, of means for reciprocating the tamper including a gear that meshes with the rack, and means for yieldingly urging the rack toward the gear.

14. In a machine of the class described, the combination with a reciprocatory tamper, of means for reciprocating the tamper, said means including a rotatable mutilated gear, a rack carried by the tamper and meshing with the gear, and a yielding guide engaging the rack to urge the same toward the gear.

15. In a machine of the class described, the combination with a rotatable mold-support, of a reciprocatory tamper coacting therewith and including a rack, a rotatable mutilated gear coacting with the rack to elevate the tamper, a guide bearing against the rack, and springs bearing against the guide to urge the same and the rack toward the gear.

16. In a machine of the class described, the combination with a rotatable mold-table, of a supporting-table located alongside the same, a vertically-reciprocating tamper coöperating with the table and having a rack, driving means connected to the table for rotating the same, a rotatable mutilated gear having connections with the driving means and meshing with the rack to elevate the same, said gear including a yieldingly-projected tooth-section, a guide bearing against the rack of the tamper, and springs engaging the guide.

17. In a machine of the class described, the combination with a stationary supporting-frame, of a rotatable mold-supporting table movable with respect to the frame, a mold mounted on the table, and a journal-bracket movably mounted on the supporting-frame and having a journal-bearing on the upper portion of the mold.

18. In a machine of the class described, the combination with a stationary supporting-frame, of a rotatable mold-supporting table having a centering device thereon, a mold mounted on the table and centered by said device, and a journal-bracket movably mounted on the supporting-frame and held against rotation, said bracket having a journal-bearing detachably engaging the mold in line with the axis of rotation thereof and coacting with the upper portion of the mold.

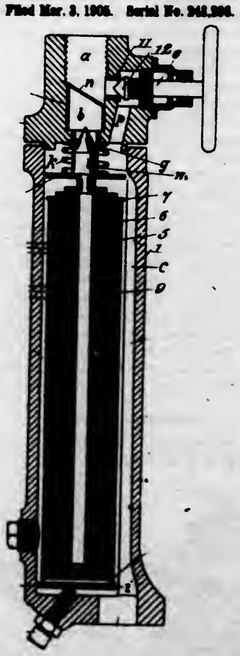
19. In a machine of the class described, the combination with a supporting-frame, of a rotatable mold-supporting table having a journal-pin, a mold mounted on the table and centered on said pin, a cap for the mold, and a journal-bracket movably mounted on the supporting-frame and coacting with the cap.

20. In a machine of the class described, the combination with a supporting-frame, of a rotatable mold-supporting table having an upstanding journal-pin, a mold comprising a base-plate centered on the table by said pin, inner and outer walls carried by the base-plate, a cap for the inner walls, said cap having an upstanding journal-pin, and a journal-bracket pivotally mounted on the frame and having a box that receives the journal-pin of the cap.

21. In a machine of the class described, the combination with a rotatable mold-support, of a mold mounted thereon, a brush mounted adjacent to the mold-support and operating about the base of the mold, a scraper operating on the mold, and common supporting means for the scraper and brush.

22. In a machine of the class described, the combination with a rotatable mold-support, of a mold mounted thereon and having an open top, means for feeding material to the mold through the open top, a supporting-frame, a swinging bracket mounted on the frame, a finishing-scraper carried by the bracket and operating on the open top of the mold, and a brush also supported by said bracket operating about the base of the mold.

809,941. **WATER-CONDUCTOR.** GOTTLIEB GLÖCKLER, Stuttgart, Germany. Filed Mar. 3, 1905. Serial No. 248,206.



Claim.—1. In a conductor, the combination of a casing open at both ends, a valve in said casing and a thermostatic device for automatically closing said valve when the temperature rises too high, said device consisting of a series of plain cylindrical tubes and a series of cylindrical tubes arranged alternately and concentrically in relation to said first-named series, said second-named series being provided with horizontal flanges at the top and at the bottom, said flanges projecting in opposite directions, whereby both series of tubes are loosely supported in contact with each other, a support for the outer cylindrical tube of the first-named series, and means for adjusting said support, substantially as described.

2. In a steam water-conductor, the combination of a casing normally open at both ends, a valve adapted to automatically close the passage in said casing when the temperature rises too high, a spring normally holding said valve open, and a thermostatic device for automatically closing said valve when steam begins to flow through said casing, consisting of a series of plain cylindrical

tubes, a second series of cylindrical tubes alternating with said first-named series, both series of tubes being arranged concentrically, said second-named series being provided with flanges at the top and bottom extending in opposite directions, said valve being connected to the inner tube of said series, a perforated plate for supporting the outer tube of said series of tubes, and a screw for adjusting said plate, substantially as described.

3. In a steam water-conductor, the combination of a casing provided with a passage therethrough, a sieve in said passage, a valve adapted to close said passage, a spring for normally holding said valve open, and a thermostatic device for automatically closing said valve when steam flows through the casing, consisting of a series of plain cylindrical tubes, a second alternately-arranged series of cylindrical tubes, said two series being composed of metals of different expansibilities under the influence of heat, said second series of tubes being provided with horizontal flanges extending in opposite directions, whereby the whole series of tubes is supported, the one upon the next, a perforated plate on which the outer tube rests, and a screw for adjusting said plate, substantially as described.

4. In a steam water-conductor, the combination of a casing provided with a passage therethrough, said passage being enlarged on one side to provide for a free flow of fluid therethrough, a valve adapted to close said passage, a spring normally holding said valve open, and a thermostatic device adapted to automatically close said valve against the tension of said spring when steam flows through said casing, said device consisting of a series of plain tubes composed of metal of one expansibility, alternating with a second series of cylindrical tubes composed of metal of a different expansibility, said second series being provided with oppositely-extending flanges at the top and at the bottom, whereby all the tubes are supported the one on the other, a perforated plate on which the outer tube rests, a screw for adjusting said plate, and a sieve located in said passage, substantially as described.

5. In a steam water-conductor, the combination of a casing provided with a passage whereby hot water may normally flow unimpeded therethrough, a sieve in said passage, a valve in said casing and adapted to close said passage, a spring normally holding said valve open, a thermostatic device for automatically closing said valve against the tension of the spring when steam enters the casing, consisting of a series of cylindrical brass tubes arranged concentrically with relation to each other, and a second series of cylindrical iron tubes provided with oppositely-projecting flanges at the top and the bottom, said iron tubes being arranged alternately with relation to said brass tubes, a perforated plate for supporting the outer brass tube, a screw for adjusting said plate, a sieve in said passage, and a control-screw in the side of the casing, substantially as described.

809,942. **CULTIVATOR.** JAMES J. GREEN, Bremen, Ga. Filed Sept. 13, 1905. Serial No. 279,015.

Claim.—1. In combination with a main beam, a pair of rigid parallel beams extending outwardly therefrom on each side, the rear beam being grooved across its upper side, spring-teeth having their shanks bolted to the forward beams and lying in the grooves in the rear beams, and supplemental beams a^2 bolted down on top of the rear beams, thereby rigidly confining the teeth in said grooves for the purpose set forth.

2. In combination with a frame carrying spring cultivating-teeth, of a series of spring-supported wheels attached to the frame and adapted to bear upon the ground, the front wheels being supported on the frame and the rear wheels on the resilient portions of the teeth.

3. In combination with a cultivator-frame carrying a series of cultivator-teeth, of one or more ground-engaging wheels at the forward end of the frame, and a pair of resiliently-supported wheels at the rear of the teeth, and supported on the teeth.

4. In combination with a cultivator-frame carrying a series of cultivator-teeth, of one or more ground-engaging wheels at the forward end of the frame, a pair of resiliently-supported wheels at the rear of the teeth and supported thereon, and means for vertically adjusting the said rear wheels.

5. In combination with a frame carrying a series of spring cultivator-teeth, a resiliently-supported wheel on the frame forward of the teeth, and a pair of resiliently-supported wheels at the rear of the teeth, and means for vertically adjusting these wheels, said means as well as the resilient supports of the wheels being supported on the teeth.

6. In a cultivator the combination of a frame carrying a series of cultivator-teeth having curved resilient body portions, a spring-supported wheel or wheels on the frame in front of the teeth, curved resilient bars C depending behind the teeth and each carrying a ground-engaging wheel, and means for vertically adjusting and locking the free wheel-carrying ends of these resilient bars.

7. In a cultivator carrying a series of curved spring-teeth, a ground-engaging wheel or wheels at the front of the frame, and a pair of ground-engaging wheels at the rear of the teeth one wheel being arranged at each side of the machine and each wheel being carried by a resilient bar extending rearwardly and downwardly behind the adjacent tooth, and means for vertically swinging the wheel-carrying ends of these resilient bars, for the purpose set forth.

8. A cultivator comprising a frame carrying a series of curved spring-teeth, a front wheel or wheels, a pair of ground-engaging wheels behind the teeth and means for supporting them one at each side of the frame, and means for vertically adjusting these wheels, these adjusting means embodying a pair of rearwardly-extending handles.

9. In a cultivator the combination of a frame carrying a series of curved spring-teeth, of a ground-engaging wheel or wheels at the forward end of the frame and a pair of ground-engaging wheels behind the teeth, a supporting-bar for each wheel pivoted at its forward end and carving down behind the adjacent tooth, and means embodying a rearwardly-extending handle for vertically adjusting the wheel-carrying end of each of said bars.

10. A cultivator comprising a frame carrying a series of spring-teeth, a ground-engaging wheel or wheels at the front end of the machine and a pair of ground-engaging wheels at the rear of the machine, each of these wheels being supported by a rearwardly and downwardly extending bar lying behind one of the cultivator-teeth, an adjusting and locking loop embracing said bar and the shank of the adjacent tooth, and means for adjusting this loop for the purpose set forth.

11. In a cultivator the combination of a frame carrying a series of curved spring-teeth, of a supporting wheel or wheels at the forward end of the frame and a pair of ground-engaging wheels at the rear of the teeth, each wheel being supported on a curved resilient bar pivotally supported at its forward end, means for vertically adjusting the free rear end of this bar, said means embodying a slidable loop engaging said bar and the adjacent tooth-shank, a bar carrying this loop at its rear end, and a handle connected to this latter-bar, substantially as set forth.

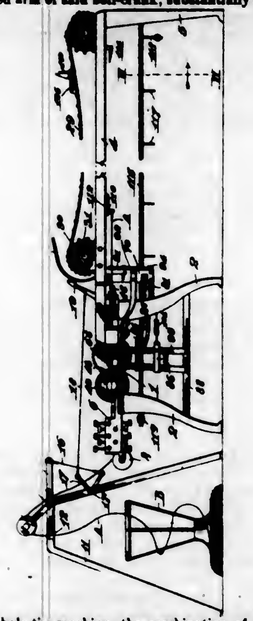
809,943. **BALE-TIE MACHINE.** ALVAH M. GRIFFIN, East St. Louis, Ill., assignor to New Process Steel & Wire Company, East St. Louis, Ill., a Corporation. Filed Jan. 23, 1905. Serial No. 242,438.

Claim.—1. In a bale-tie machine, the combination of a loop-form, means for folding the wire around said form, a twister-head, a pair of twister-fingers independently pivoted to said head and arranged to engage the folded wire, and reciprocating arms free of connection with said fingers for carrying said fingers into engagement with said wire, substantially as set forth.

2. In a bale-tie machine, the combination of a loop-form, means for holding the wire around said form, a hollow spindle, a twister-head carried by said spindle, twister-fingers carried by said twister-head, a reciprocating collar mounted on said spindle and having means for engaging said twister-fingers, a spring-controlled bell-crank for actuating said collar, and means for actuating said bell-crank; said bell-crank consisting of an unyielding arm and a resilient arm, substantially as set forth.

3. In a bale-tie machine, the combination of a hollow spindle, a twister-head carried by said spindle, twister-fingers carried by said head, a reciprocating collar mounted on said spindle and having means for engaging said twister-fingers, a bell-crank for actuating said collar, a trip-wheel for engaging with said bell-crank, an anti-friction-roller on said bell-crank arranged to ride upon a support over which the bell-crank operates and an antifriction-roller of said bell-crank to receive the impingement of the bell-crank-actuating portion of said trip-wheel, substantially as set forth.

4. In a bale-tie machine, the combination of a hollow spindle, a twister-head carried by said spindle, twister-fingers pivoted to said head, a reciprocating collar mounted on said spindle, a pair of arms carried by said collar and arranged to be moved toward said twister-fingers, rollers mounted in said arms, a bell-crank having one of its arms arranged in engagement with said collar, an antifriction-roller mounted on the other arm of said bell-crank, a runway on which said roller operates, and a trip-wheel arranged for engagement with the last-named arm of said bell-crank, substantially as set forth.



5. In a bale-tie machine, the combination of a loop-forming mechanism, a conveyer, a wire-carried arm connected to said conveyer and adapted to engage the loop of the wire, and stripping-fingers having beveled lower sides to receive the loop and discharge it from engagement with said wire-carrier arm, substantially as set forth.

6. In a bale-tie machine, the combination of a loop-forming mechanism, a conveyer, a wire-carrier arm connected to said conveyer and adapted to receive said loop, a track-rail in the course of travel of said conveyer and on which said wire-carrier arm travels, and stripper-fingers supported by said track-rail; said stripper-fingers having beveled lower sides and being adapted to free the loop from said carrier-arm, substantially as set forth.

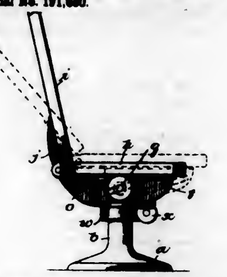
7. In a bale-tie machine, the combination of loop-forming mechanism, a conveyer, a wire-carrier arm pivoted to said conveyer and having a finger for receiving the wire loop, a track-rail in the course of travel of said conveyer, a roller carried by said carrier-arm adapted to ride on said track-rail, and guide-fingers for directing the travel of said roller as said loop-receiving finger is moved into position to receive the loop, substantially as set forth.

8. In a bale-tie machine, the combination of a tie-producing mechanism, a power-shaft by which said mechanism is operated, a clutch for controlling the operation of said power-shaft, and means for controlling said clutch consisting of a lever, connections leading to said lever from said clutch, and a bell-crank connected to said lever and having a roller over which the wire delivered to the machine passes, whereby said bell-crank is caused to be moved to actuate said clutch when feeding of the wire is interrupted, substantially as set forth.

9. In a bale-tie machine, the combination with mechanism for forming the bale-ties, of a tie-catcher, a latch for retaining said catcher in tie-receiving position, a primary counting-wheel actuated by said tie-forming mechanism, and a secondary counting-wheel actuated by said primary counting-wheel and arranged to trip said latch and free said catcher after a predetermined number of ties have been deposited thereon, substantially as set forth.

10. In a bale-tie machine, the combination with mechanism for forming bale-ties, of a tie-catcher, a latch for retaining said catcher in tie-receiving position, a counting-wheel arranged to trip said latch, a rocking rod actuated by the tie-forming mechanism, a pawl carried by said rod and arranged for engagement with said counting-wheel, and means for carrying said pawl to said counting-wheel, a shaft driven by the wire passing through the machine, a spring-pressed collar on said shaft controlling said pawl-actuating means, and a pendulum fixed to said shaft and controlling said collar, substantially as set forth.

809,944. **CHAIR.** JAMES B. HANSEM, Washington, D. C. Filed Feb. 1, 1904. Serial No. 191,660.



Claim.—1. In a chair, the combination of a base, a support revolubly mounted on said base, a back hinged to said support, said support extending underneath said seat and being hinged to said back at or near a line passing through the vertical center thereof, means for adjusting said seat and back relatively to each other, and means for securing said back and seat against movement after the desired adjustment has been made, substantially as described.

2. In a chair, the combination of a perforated base, a chair-bottom, a back hinged thereto, a plate pivoted to said chair-back and supported by said base, a second plate carried by said chair-bottom, and means for adjustably securing said plates together, substantially as described.

3. In a chair, the combination of a hollow base, a chair-bottom provided with a downwardly-extending plate, a chair-back hinged to said chair-bottom, a curved plate hinged to said chair-back and provided with a spindle engaging said base, and means for adjustably clamping said plates together, substantially as described.

4. In a chair, the combination of a perforated base, a chair-bottom provided with a downwardly-extending slotted plate, a chair-back hinged thereto, a curved plate pivoted to said chair-back and provided with a spindle engaging said base, and means passing through one of the slots in said first-named plate for clamping said plates together, substantially as described.

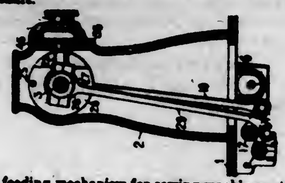
5. In a chair, the combination of a base provided with a central perforation, the upper part of which is reamed out to form an aperture the upper part of which is in the shape of an inverted cone a chair structure provided with a correspondingly-shaped spindle, a spring between the lower end of said spindle and said base, a plate carried by said chair structure and provided with a friction-collar, and means for tightening said friction-collar to prevent rotation of the chair structure upon said base, substantially as described.

6. In a chair, the combination of a base provided with an upwardly-extending central portion, said portion being provided with a cylindrical recess reamed out at the top, a chair-back, a curved plate attached to said chair-back and provided with a spindle engaging the recess in said base, a second plate parallel to said first-named plate and pivoted on said chair-back, a chair-bottom, a downwardly-extending slotted plate attached to said bottom, locking and guiding means for said three plates passing through said slots, a downwardly-extending part on said last-named plate, a friction-collar carried by said extension, and means for tightening said friction-collar, substantially as described.

809,945. **FEED-REGULATING DEVICE FOR SEWING-MACHINES.** MARTIN HEELAN, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed June 12, 1905. Serial No. 264,770.

Claim.—1. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a transversely-adjustable feed-actu-

cating eccentric mounted upon said shaft, a rock-shaft, a connecting-rod intermediate said eccentric and rock-shaft, adjusting means applied to and adapted to rotate with said eccentric for shifting the same transversely of its supporting-shaft, and a rotary operating device disposed at one side of said shaft and normally disconnected from the adjusting means of said eccentric but adapted to engage the same for varying the eccentricity of said eccentric laterally upon its supporting-shaft.



2. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a transversely-adjustable feed-actuating eccentric mounted upon said shaft, a rock-shaft, a connecting-rod intermediate said eccentric and rock-shaft, adjusting means applied to and adapted to rotate with said eccentric for shifting the same transversely of its supporting-shaft, an endwise-movable rotary spindle disposed radially at one side of said shaft and adapted for operative engagement with the adjusting means of said eccentric, means for maintaining said spindle normally retracted from operative relation with said adjusting means, and a locking device for preventing the rotation of said spindle in retracted position.

3. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a collar fixed thereon, a feed-eccentric movably mounted on said fixed collar, an adjusting-screw for determining the lateral position of said eccentric in relation to its supporting-collar, an endwise-movable rotary spindle mounted in a fixed support and adapted to register with said adjusting-screw and operatively engage the same for turning it, and means for preventing the disengagement of said spindle from the adjusting-screw excepting in certain predetermined axial positions of the same.

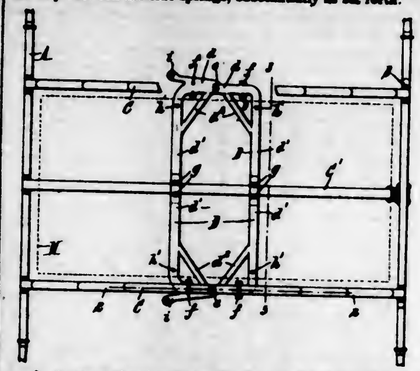
4. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a collar fixed thereon, a feed-eccentric movably mounted on said fixed collar, an adjusting-screw for determining the lateral position of said eccentric in relation to its supporting-collar, an endwise-movable rotary spindle mounted in a fixed support and adapted to register with said adjusting-screw and operatively engage the same for turning it, a dial carried by said spindle and a stationary pointer cooperating therewith, and means for preventing the disengagement of said spindle from the adjusting-screw intermediate the graduations of said dial.

5. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a collar fixed thereon, a feed-eccentric movably mounted on said fixed collar, an adjusting-screw for determining the lateral position of said eccentric in relation to its supporting-collar, an endwise-movable rotary spindle mounted in a fixed support and adapted to register with said adjusting-screw and operatively engage the same for turning it, a dial carried by said spindle and provided with a series of peripheral notches, and a stationary pointer-finger cooperating with said dial and provided with a tooth adapted to enter one of said peripheral notches in the dial in the retracted position of said spindle from operative relation with said adjusting-screw but to permit said dial to be rotated freely for the rotation of said adjusting-screw by said spindle.

6. In a feeding mechanism for sewing-machines, the combination with a rotary shaft, a collar fixed thereon, a feed-eccentric movably mounted on said fixed collar, an adjusting-screw for determining the lateral position of said eccentric in relation to its supporting-collar, an endwise-movable rotary spindle mounted in a fixed support and adapted to register with said adjusting-screw and operatively engage the same for turning it, a spring for maintaining said spindle normally retracted from operative engagement with said adjusting-screw, a dial carried by said spindle, and a stationary pointer-finger cooperating with said dial in indicating the axial position of said spindle and provided with a stop-shoulder for operatively engaging said dial to limit the movement of said spindle under the action of its retracting-spring.

809,946. SPRING-GEAR FOR VEHICLES. CHARLES A. HERRICK, Buffalo, N. Y., assignor to Pratt & Letchworth Company, Buffalo, N. Y. Filed Jan. 12, 1905. Serial No. 240,752.

Claim.—1. A connecting-frame for the side springs of vehicle-spring gears, comprising four angle-shaped corner-pieces having longitudinal arms which extend substantially parallel with and are connected to the side springs, and transverse arms which extend inwardly from the longitudinal arms, the inner ends of the transverse arms of opposite corner-pieces being secured together substantially midway between the side springs, substantially as set forth.



2. A connecting-frame for the side springs of vehicle-spring gears, comprising four corner-pieces, each having a longitudinally-extending arm and a transversely-extending arm, the ends of the longitudinal arms of the pieces at each side of the gear overlapping and being secured together and to the side spring, and the inner ends of the transverse arms of opposite corner-pieces overlapping and being secured together substantially midway between the side springs, substantially as set forth.

3. A connecting-frame for the springs of vehicle-gears having side springs and a center longitudinal member, comprising four angle-pieces having longitudinal arms which extend substantially parallel with and are attached to the side springs, and transverse arms which extend toward and terminate substantially at said center member of the gear, the inner ends of the transverse arms of the corner-pieces being secured to said center member of the gear, substantially as set forth.

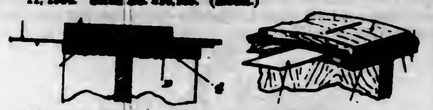
4. In a vehicle-spring gear, the combination of side springs, and a connecting-frame comprising four angle-shaped corner-pieces having longitudinal arms which extend substantially parallel with and are connected to the side springs, and transverse arms which extend inwardly from the longitudinal arms, the inner ends of the transverse arms of opposite corner-pieces being secured together substantially midway between the side springs, substantially as set forth.

809,947. BATHING-HAT. FLORENCE B. HERNDON, Dallas, Tex. Filed Dec. 1, 1904. Serial No. 234,054.

Claim.—1. A bathing-hat comprising a brim having a central opening, crown secured at its edge to the brim and the edge of the central opening, and a band comprising two thicknesses of material connected at their inner edges, the outer edges thereof being secured one to the inner face of the crown and the other to the under face of the brim.

2. A bathing-hat comprising a brim having a central opening and having a flexible stiffening-strip at its periphery, a crown secured at its edge to the brim at the edge of the central opening, a band comprising two thicknesses of material connected at their inner edges, the outer edges thereof being secured one to the inner face of the crown and the other to the under face of the brim to prevent leakage of water between the brim and the crown, devices carried by the crown at opposite points thereof and devices carried by the brim at opposite points of its periphery and adapted for engagement with the first-mentioned devices to hold the opposite points of the brim raised.

809,948. PACKAGE. JOHN HUSS, Port Huron, Mich. Filed July 11, 1904. Serial No. 216,163. (Model.)



Claim.—1. In a package, a cylindrical body formed of a continuous web, wound into a plurality of plies, the outer and inner plies terminating adjacent to but slightly spaced from each other and the connecting portion of the web being bent therebetween in place.

2. In a package, a cylindrical body formed of a continuous web, wound into a plurality of plies, the outer and inner plies terminating adjacent to, but slightly spaced from, each other and the connecting portion of the web being bent therebetween, in place to produce a substantially cylindrical form.

3. In a package, a cylindrical body formed of a continuous web, wound into a plurality of plies, the edges of the outer and inner ply terminating adjacent to each other with a space between equal to the thickness of the intervening ply or plies and portion of the latter being bent between said edges to maintain the true cylindrical form.

4. A package, comprising a cylindrical body, formed from a continuous web of appreciable thickness, wound into a plurality of plies, the outer and inner ply terminating adjacent to, but slightly spaced from, each other the connecting portion of said web being bent in place, a circular head snugly fitting within said body and a surrounding hoop closely fitting the outer surface of said body.

5. A package, comprising a cylindrical body formed from a continuous web wound into a plurality of plies, the ends of the web terminating adjacent to but slightly short of each other on opposite faces of an intermediate ply, a plurality of hoops surrounding said body and closely fitting the same, whereby that portion of the body in contact with the hoops is forced and held in substantially cylindrical form and the edge of the outer ply is consequently placed under tension, for the purpose described.

6. A package, comprising a cylindrical body formed from a continuous web wound into a plurality of plies, the inner and outer ply terminating adjacent to but slightly short of each other on opposite faces of an intermediate ply, inner and outer hoops attached to said body and closely fitting the same, whereby that portion of the body in contact with the hoops is forced and held substantially cylindrical, thus causing a bending of the material between the adjacent ends of the web, whereby the resiliency of the material will place the outer end of the web under tension.

7. In a package, the combination with a cylindrical body, of a pair of chime-hoops secured within said body and arranged on opposite sides of the head and a tie within said body directly connecting said hoops.

8. In a package, the combination with a cylindrical body, of a pair of chime-hoops secured within said body on opposite sides of the head and a tie connecting said hoops, passing between the same and the head and said body.

9. In a package, the combination with a cylindrical body, of a pair of chime-hoops secured within said body upon opposite sides of the head and a tie connecting said hoops, comprising a strip of sheet metal passing between said hoops and edges of the head and the body.

10. In a package, the combination with a cylindrical body, of a pair of chime-hoops secured therein on opposite sides of the head and a tie between said hoops comprising a strip of metal passing between said hoops and the edges of the head and the body and bent at opposite ends to form hooks, embracing said hoops.

11. In a package, the combination with a cylindrical body, of a pair of chime-hoops secured therein on opposite sides of the head, a tie between said hoops, comprising a strip of metal passing between said hoops and the edges of the head and the body and bent at opposite ends to form hooks, embracing said hoops, and securing-nails passing through said bent ends, the hoop, the strip between the hoop and the cylinder, and into the cylinder.

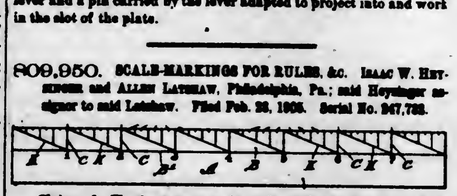
12. In a package of the class described, the combination of two head-supporting hoops, a head interposed between said hoops, a flat metal strip placed between said hoops, head and the shell of said package, the ends of said strip being folded around said hoops and secured thereto and to said shell, substantially as described.

809,949. WIRE-STRETCHER. JOHN HERSHAMP and OSMAR SHUMAKER, Charlottesville, Va. Filed May 1, 1905. Serial No. 258,269.

Claim.—1. A device of the kind described comprising a shank having a bifurcated portion, a lateral projection, carried by one member of the bifurcated portion, a lever pivoted in the bifurcation and overlapping the projection, a rib formed on the lever, a slotted plate pivoted upon the projection and overlapping the lever, one edge of said plate having a flange adapted to coact with the rib, and a pin carried by the lever and projecting into the slot of the plate.

2. A device of the kind described comprising a shank having a bifurcated portion, said portion being curved adjacent to its end, a stop-block carried in the bifurcation, an angled lever pivoted in the bifurcation and adapted to engage the stop-block, a lateral projection carried by one of the bifurcated members, the angled end of the lever working upon said projection, a rib carried by the lever, a plate pivoted upon the projection and longitudinally slotted, said plate having a curved flanged edge adapted to engage the rib of the lever and a pin carried by the lever adapted to project into and work in the slot of the plate.

809,950. SCALE-MARKINGS FOR RULES, &c. ISAAC W. HEYSINGER and ALLEN LATHAW, Philadelphia, Pa.; said Heysinger assignor to said Lathaw. Filed Feb. 28, 1905. Serial No. 247,728.



Claim.—1. The improvement in scale-markings for measuring devices, consisting of a rule or bar, a series of transverse, main divisional cross-markings, extending inward from the free margin of said bar, and of equal height, and a series of diagonal lines extending from the marginal end of each of said main divisional cross-markings to the top of the next succeeding main cross-marking, and a series of subdivisional coördinates parallel with said main cross-markings, and connecting said diagonals with the free margin of said bar, together with a series of numerals or the like contiguous to said markings, and adapted to interpret the same, substantially as described.

2. As an article of manufacture, a measuring-rule having one portion thereof longitudinally flat, and the remaining portion beveled to the measuring-margin of said rule, said bevel provided with the divisional markings of said rule, and the flat portion without said markings, said markings consisting of a series of equal, parallel main divisional lines extending across said bevel and at right angles to the margin thereof, said main divisional lines dividing said bevel into a continuous series of rectangular parallelograms, said parallelograms divided by diagonal markings, into two equal right-angled triangles, and subdivisional cross-markings parallel to said main divisional markings, extending from the free margin of the bevel of said rule to the said diagonal, and suitable numerals or the like adapted to interpret the lengths of the same along said margin, substantially as and for the purposes required.

3. As an article of manufacture, a measuring device having its measuring-margin divided into a series of parallelograms, the long sides thereof coincident with said margin, and said parallelograms divided each into two equal right-angled triangles, the apex of each marginal triangle constituting the beginning-point of the longitudinal measurements of each of said parallelograms, and the subdivisional cross-markings extending from the free margin thereof to the said diagonal, and subordinate subdivisions composed of parallel, and equally-directed smaller right-angled triangles, within said main triangles, the subordinate cross-markings thereof, to indicate subordinate lengths along said margin, parallel with the other cross-markings, and connecting said free margin with said subordinate diagonals, substantially as and for the purposes described.

4. As an article of manufacture a measuring device consisting of a base, and along said base a series of right-angled triangles, the apices thereof turned toward the beginning of said base, and the bases of each of said triangles constituting the point of departure of the next succeeding triangle, and a series of cross-markings extending across said triangles, at equal distances along said margin, and at right angles thereto, said cross-markings proportionate, along each triangle, to the altitude of the base of said triangle as com-

pared with the longitudinal measurements along the free margin thereof, substantially as described.

5. A longitudinal measuring device consisting of a bar of suitable length, the upper surface divided longitudinally into two lateral segments, one of said segments left plain, and the body thereof adapted to give substance and weight to said measuring device, and the other of said segments provided with a series of elongated rectangles constituting main divisions, and with a graduated series of longitudinal subdivisions, indicated by cross-markings extending, at right angles from the free margin thereof inward across said marked segment, said subordinate cross-markings having a proportionate and gradually-increased height from said margin, corresponding to the gradually-increased length along said margin, but said cross-markings not equal in actual heights to the lengths of said marginal measurements, substantially as described.

809,951. FLY-PAPER HOLDER. JOHN W. HIXSON, St. Joseph, Mo. Filed Mar. 28, 1905. Serial No. 251,492.

Claim.—1. A fly-paper holder comprising a curved member, paper-fastening devices on said member, a socket member attached to the curved member, and a bracket for engaging in said socket member.

2. A fly-paper holder comprising a transversely-curved plate, rings under the plate, wires extended from said rings to connection with the plate near its ends, a bracket having a portion for engaging in said rings, and spring-clips on the lower edges of said plate.

809,952. MEDICINE-GLASS. CHARLES W. HOOPA, Garrett, Pa. Filed Feb. 28, 1905. Serial No. 247,736.

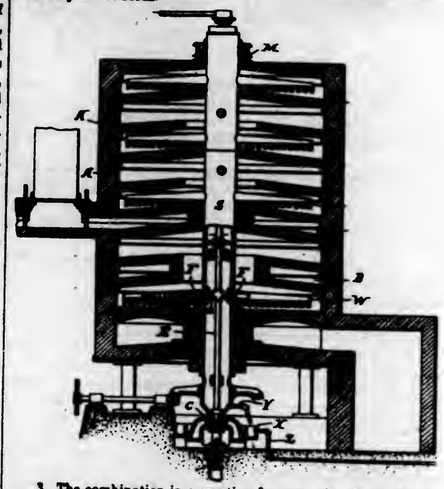
Claim.—1. As a new article of manufacture a glass formed in a single piece of material comprising a graduated body having an integral conical cover provided with an outlet which is eccentrically arranged therein, said body being adapted to hold liquids when placed in a vertical or horizontal position; and a flange of varying width surrounding the outlet and integral with the body, the widest portion of the flange being located at the center of the top and having a recess therein, the bottom of which curves gradually from the outlet to the edge of the flange, whereby liquid is caused to flow from the outlet and over all portions of the bottom of the recess.

2. As a new article of manufacture a glass formed in a single piece and having an integral top provided with an outlet, said outlet being surrounded by a flange having a spoon-shaped recess therein constituting a secondary receptacle, the bottom of said secondary receptacle being gradually curved from the outlet-opening to the outlet end of the recess.

809,953. ROASTING-FURNACE. OTTOKAR HOFMANN, Argentine, Kans., assignor to The United Zinc and Chemical Company, Kansas City, Mo., a Corporation of New Jersey. Filed Feb. 19, 1904. Serial No. 194,269.

Claim.—1. The combination in a roasting-furnace, of a pipe, hollow radial arms extending therefrom, and water-supply pipes arranged to deliver water into said arms said water-supply pipes being provided with spraying means, substantially as set forth.

2. The combination in a roasting-furnace, of a pipe, hollow radial arms extending therefrom, and water-supply pipes provided with means to spray water in regulated streams into said arms, substantially as set forth.



3. The combination in a roasting-furnace, of a pipe, hollow radial arms extending therefrom, water-supply pipes provided with means to spray water into said arms, and passages whereby steam can escape from the arms into said pipe, substantially as set forth.

4. The combination in a roasting-furnace, of the successive hearths, a hollow shaft or pipe 8 extending through the hearths, and supported to rotate, hollow arms carried by the shaft, a water-pipe extending through the shaft 8, and branches extending from the water-pipe into said arms and each provided with openings for spraying water into the arms, substantially as set forth.

5. The combination in a roasting-furnace, of the successive hearths, a hollow shaft 8 extending through the hearths, and supported to rotate, hollow arms carried by the shaft, a water-pipe extending through the shaft 8, and branches extending from the water-pipe into said arms and each provided with openings for spraying water into the arms, said openings being proportioned to the amount of water to be sprayed, substantially as set forth.

6. The combination in a roasting-furnace, of the successive hearths, a hollow shaft 8 extending through the hearths, and supported to rotate, hollow arms carried by the shaft, a water-pipe extending through the shaft 8, branches extending from the water-pipe into said arms and each provided with means for spraying water into the arms, a free outlet at the lower end of the shaft 8, a discharge-pipe Y communicating therewith, and a trough X below the discharge-pipe, whereby to prevent accumulations of water in the shaft, substantially as set forth.

7. The combination in a roasting-furnace, of a shaft, hollow arms extending radially from the shaft, water-supply pipes and means on said pipes for spraying water against the inner faces of the side walls of each arm, substantially as set forth.

8. The combination in a roasting-furnace, of a shaft, hollow arms extending radially through the shaft, water-pipes arranged within and extending longitudinally of the arms, each of said pipes being provided with water-spraying means, and means for supplying water to said pipes, substantially as set forth.

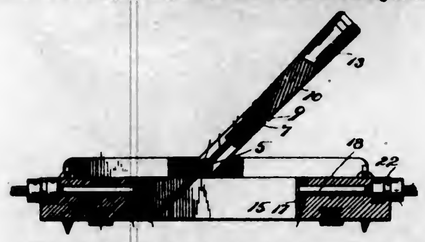
809,954. MORTISING-TOOL. FREDERICK K. HUBER, Colton, Tex. Filed Mar. 21, 1905. Serial No. 251,206.

Claim.—1. A device of the character described, comprising a body, and a longitudinally-movable, swinging cutting-tool slidably connected to the body.

2. A device of the character described, comprising a body, a longitudinally-movable, swinging cutting-tool slidably connected to the body, and means to limit the sliding movement of the tool.

3. A device of the character described, comprising a body, a longitudinally-movable, swinging cutting-tool slidably connected to the body, and means for adjustably limiting the sliding and longitudinal movement of the tool.

4. In a device of the character described, the combination of a body, of a carriage slidably mounted therein, a swinging, cutting device longitudinally movable within the carriage, and adjustable means for limiting the longitudinal movement of the cutting device.



5. In a device of the character described, the combination with a body, of a carriage movable thereon, a swinging, cutting device longitudinally movable within the carriage, adjustable means for limiting the longitudinal movement of the cutting device, and adjustable means for limiting the movement of the carriage.

6. In a device of the character described, the combination with a body, of a carriage movably mounted therein, a swinging member mounted upon the carriage, and a cutting device longitudinally movable within said member.

7. In a device of the character described, the combination with a body, of a carriage movably mounted therein, a swinging member mounted upon the carriage, a cutting device longitudinally movable within said member, and adjustable means for limiting the movement of the cutting device within the swinging member.

8. A device of the character described, comprising a body having an elongated opening therein, and adjustable stop devices within the opening, and a swinging cutting device longitudinally movable within the carriage.

9. A device of the character described, comprising a body having an elongated opening and adjustable stop devices within the opening; a carriage mounted upon the body, a yoke movably connected to the carriage, a cutting device longitudinally movable within the yoke and movable therewith, and means to limit the longitudinal movement of the cutting device within the yoke.

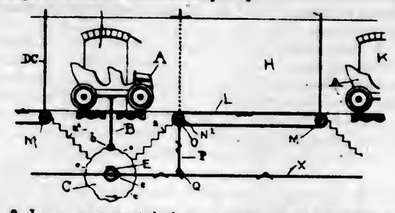
10. In a device of the character described, the combination with a body, guide devices adjustably connected thereto and means for securing the body to a structure, said body having an elongated opening therein; of a carriage mounted upon the body, a yoke movably connected to the carriage, a cutting device longitudinally movable within the yoke and movable therewith, and means to limit the longitudinal movement of the cutting device within the yoke.

809,955. PHOTOMECHANICAL PRINTING. JOHN W. IPPERS, New York, N. Y., assignor to Albert Henry Walker, trustee, New York, N. Y. Filed July 6, 1905. Serial No. 268,344.

Claim.—The following process in photomechanical printing: making a half-tone photograph of a graduated picture or design, through a half-tone screen: making a sensitive gelatin plate on an elastic base: exposing that sensitive gelatin plate to light, through that half-tone photograph: developing that exposed gelatin plate, by bathing it in water, and thereby swelling into relief those areas of the gelatin plate which were under the dark areas of the half-tone photograph, while leaving in depression those areas of the gelatin plate which were under the translucent areas of the half-tone photograph, during the exposure: drying that developed gelatin plate in air: applying glycerin solution to the relief areas of that gelatin plate: applying ink to the depressed areas of that gelatin plate: transferring ink from the depressed areas of that inked gelatin plate to the periphery of a metal roller, by pressing that periphery directly and powerfully upon that gelatin plate; and etching away the uninked areas of that periphery; all substantially as described.

809,956. AMUSEMENT DEVICE. CHARLES H. JARDEN, New York, N. Y. Filed Oct. 10, 1905. Serial No. 282,166.

Claim.—1. In an amusement device, a stationary body representing a vehicle, means whereby the occupants may be seated to face either forwardly or rearwardly, and connections for imparting rocking movements to the stationary body.



2. In an amusement device, a stationary body representing a vehicle, means for reversing said body to face either forwardly or rearwardly, and connections for imparting rocking movements to the stationary body.

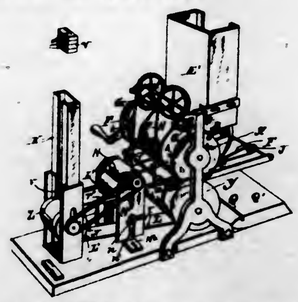
3. In an amusement device, a stationary body representing a vehicle, connections for imparting rocking movements to said body, a flexible body representing a roadway, and connections for moving said flexible body toward the stationary body.

4. In an amusement device, a stationary body representing a vehicle, a flexible body representing a roadway a main shaft and connections therefrom for respectively rocking the stationary body and for moving the flexible body toward the stationary body.

5. In an amusement device, a stationary body representing a vehicle, means whereby the occupants may be seated to face either forwardly or rearwardly, traveling bands representing scenery at opposite sides of the body and means to incline said bands toward each other in the direction viewed by the occupants of the stationary body.

6. In an amusement device, a stationary body representing a vehicle, and connections for imparting rocking movements to said body, said connections including a rotatable barrel provided with peripheral projections and means for rotating said barrel and moving it lengthwise.

809,957. ENVELOP PRINTING AND ADDRESSING MACHINE. MICHAEL P. KENNA, Dubuque, Iowa. Filed Aug. 22, 1904. Renewed May 2, 1905. Serial No. 258,505.



Claim.—1. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means carried by the belt for engaging the slugs and carrying them between the rollers, and inking devices intermediate the magazine and the said rollers.

2. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs arranged above the belt, catches carried by the belt adapted to engage the slugs and carry them between the rollers and inking devices intermediate the magazine and the said rollers.

3. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means carried by the belt adapted to engage the slugs and carry them between the rollers, a support over which the conveyer-belt travels and inking devices arranged at a point adjacent to and above the said support.

4. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing be-

tween the rollers, means for effecting the engagement of one of the

to receive the inner ends of the outer pastiche, and means for locking

tween the rollers, means for effecting the engagement of one of the rollers and the belt as the latter travels around said roller, a magazine for printing-slugs, means for effecting the engagement of the belt and the slugs, and inking devices intermediate the magazine and the rollers.

5. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means for effecting engagement of the belt with the slugs, inking devices intermediate the magazine and rollers, an inclined chute arranged to effect the disengagement of the slugs from the belt and a galley into which the chute is adapted to discharge the disengaged slugs.

6. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means for effecting engagement of the belt with the slugs, inking devices intermediate the magazine and the rollers, an inclined chute arranged to effect the disengagement of the slugs from the belt, and a transversely-adjustable galley into which the chute is adapted to discharge the disengaged slugs.

7. In a machine of the character described, the combination with two superposed rollers, the lower one of which is provided with circumferential grooves, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means for effecting engagement of the belt and slugs, an inclined chute provided with projecting points or spurs adapted to enter the grooves in the roller, and a galley into which the chute is adapted to discharge the disengaged slugs.

8. In a machine of the character described, the combination with two superposed rollers, the lower one having circumferential grooves, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, each slug having extensions at the ends to travel in the grooves of the roller, means for effecting the engagement of the belt with the slugs, an inclined chute having projecting points or spurs adapted to enter the grooves in the roller and to disengage the slugs from the belt and a galley into which the chute is adapted to discharge the disengaged slugs.

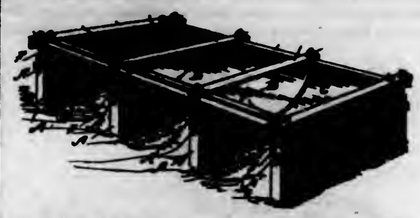
9. In a machine of the character described, the combination with two superposed rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means carried by the belt for engaging the slugs and carrying them between the rollers, inking devices intermediate the magazine and the said rollers, an envelop-receptacle arranged with its discharge end adjacent to the circumference of the upper roller, clips carried by the upper roller and means for feeding the envelops successively into a position to be grasped by the said clips, and means for operating the clips in the manner and for the purposes specified.

10. In a machine of the character described, the combination with two superposed printing-rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means carried by the belt for engaging the slugs and carrying them between the rollers, inking devices intermediate the magazine and the said rollers, an envelop-receptacle arranged at an inclination with its discharge end adjacent to the circumference of the upper roller, clips carried by the upper roller, feed-tapes arranged to convey the envelops along the receptacle, means for imparting a step-by-step movement to the tapes and means for operating the clips in the manner and for the purpose specified.

11. In a machine of the character described, the combination with two superposed printing-rollers, of a conveyer belt or chain passing between the rollers, a magazine for printing-slugs, means carried by the belt for engaging the slugs and carrying them between the rollers, inking devices intermediate the magazine and the said rollers, an envelop-receptacle arranged at an inclination with its discharge end adjacent to the circumference of the upper roller, clips carried by the upper roller, feed-tapes arranged to convey the envelops along the receptacle, rollers at the ends of the receptacle and upon which the said tapes run, a ratchet-wheel on the shaft of the lower roller, a lever also mounted at one end on the said shaft, a cam on the shaft of the upper printing-roller and upon which cam the opposite end of the lever bears and a pawl on said lever engaging the ratchet-wheel, all arranged for coöperation as described.

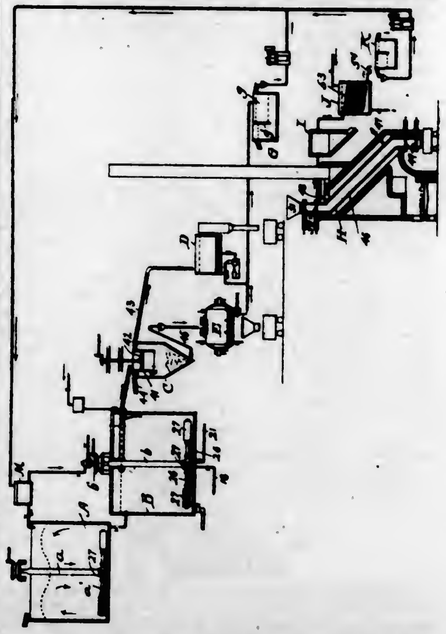
809,958. STOCK-TANK. FRED KNEWSY, Holton, Mich. Filed Dec. 2, 1904. Serial No. 235,434.

Claim.—1. The combination with a base, semicylindrical sections adapted to rest on said base, the outer sections having end pieces and an inner section bent at its ends to form a sleeve adapted to receive the inner ends of the outer sections, and means for locking the sections to the base.



2. A device of the kind described comprising a base, interlocking sections semicylindrical in cross-section, angled bars arranged on the sides of the said sections, angled bars on the ends of the sections, eyes carried by the base, hooks connected to the end bars and adapted to engage a portion of the said eyes, transverse strips, flanged intermediate their ends and bearing on the side bars, and hooks secured to the side bars and adapted to engage a portion of the eyes.

809,959. PROCESS OF SEPARATING MINERALS. EDMUND B. KIRBY, Rossland, Canada. Filed Dec. 14, 1903. Serial No. 185,033.



Claim.—1. The process of separating ores, which consists in mixing together pulverized mineral material, a considerable quantity of water, and a substance immiscible in water, but of less specific gravity, and which will, in the presence of water, adhere to some of the mineral particles and not to others; in violently agitating the mass so as to break up said immiscible substance into minute globules; in allowing said mass to settle whereby a considerable quantity of the mineral particles having become coated with said substance will float to the top of the mass, and in gently agitating the portion thereof which settles, and in blowing into the same a gas for the purpose of assisting the flotation of said substance and the mineral particles coated therewith; in removing the floating layer, and in separating the mineral particles from said immiscible substance, substantially as specified.

2. The process of separating ores, which consists in mixing together pulverized mineral material, a considerable quantity of water, and a solution of bitumen in a light hydrocarbon liquid, the proportion of bitumen in solution being substantially sufficient to insure the coating and entrainment of the mineral particles; in violently agitating this mixture to break up said solution into fine globules; in allowing the mass to settle, and then gently agitating the same and blowing in gas to insure the flotation of said solution and the mineral particles coated thereby; in removing the floating layer; and separating the mineral particles from the solution, substantially as specified.

3. The process of separating ores, which consists in mixing together pulverized mineral material, a considerable quantity of water, and a solution of bitumen in a light hydrocarbon liquid, the proportion of bitumen in solution being substantially sufficient to insure the coating and entrainment of the mineral particles; in violently agitating this mixture to break up said solution into fine globules; in allowing the mass to settle, and then gently agitating the same and blowing into it a gas and some of the said solution to insure the flotation of said solution and the mineral particles coated thereby; in removing the floating layer; and separating the mineral particles from the solution, substantially as specified.

4. The process of separating minerals, which consists in mixing together the pulverized mineral material a considerable quantity of water, and a solution of bitumen in a light hydrocarbon liquid; in allowing the same to settle, and removing therefrom the floating layer of said solution and the mineral particles which have been coated thereby; and in filtering the material so removed, substantially as specified.

5. The process of separating minerals, which consists in mixing together the pulverized mineral material, a considerable quantity of water, and a solution of bitumen in a light hydrocarbon liquid, the proportion of bitumen in solution being substantially sufficient to insure the coating and entrainment of the mineral particles; in gently agitating this mixture and blowing gas into the same to assist the flotation of said solution and the mineral particles which have been coated thereby; in removing said floating layer; and filtering the same, substantially as specified.

6. The process of separating minerals which consists in mixing together the pulverized mineral material, a considerable quantity of water, and a solution of bitumen in a distillable hydrocarbon liquid, the proportion of bitumen in solution being substantially sufficient to insure the coating and entrainment of the mineral particles; in allowing the same to settle, and removing therefrom the floating layer of said solution and the mineral particles which have been coated thereby; in filtering the material so removed; and in distilling the concentrate residue and condensing the hydrocarbon vapors driven off, substantially as specified.

7. The process of separating minerals, which consists in mixing together the pulverized mineral material, a considerable quantity of water, and a solution of bitumen in a distillable hydrocarbon liquid; in gently agitating this mixture and blowing gas into the same to assist in the flotation of said solution and the mineral particles which have been coated thereby; in removing the floating layer, and filtering the same; and in distilling the concentrate residue and condensing the hydrocarbon vapors driven off, substantially as specified.

8. The process of separating minerals, which consists in mixing together the pulverized mineral material, a considerable quantity of water, and a solution of bitumen and kerosene; in gently agitating this mixture, and in blowing a gas into the same to assist in the flotation of said solution and the mineral particles which have been coated thereby; and in separating said solution and mineral particles, substantially as specified.

9. The process of separating minerals, which consists in mixing together the pulverized mineral material, a considerable quantity of water, and a solution of bitumen in kerosene, and in vigorously agitating this mixture so as to break up said solution into minute globules; in gently agitating said mixture and blowing a gas into the same to assist in the flotation of said solution and the mineral particles coated thereby; in removing the floating layer; in washing and filtering the same; and finally in distilling the concentrate residue and condensing the hydrocarbon vapors driven off, substantially as specified.

809,960. CABINET-WORK FOR SEWING-MACHINE TABLES. THOMAS KENNEY, Lakewood, Ohio. Filed Sept. 26, 1905. Serial No. 280,155.

Claim.—1. Cabinet-work for a sewing-machine table comprising a table-top; a drawer-case arranged in under an end of the table-top and comprising a horizontally-arranged top and shelves spaced vertically to form compartments, with the top of the drawer-case attached to the table-top, and the drawers in the aforesaid compartments, with each drawer provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, and each shelf being provided at its forward end and inner side with a laterally and inwardly projecting extension arranged to afford bearing to the extension of the drawer on the said shelf.

table-top and provided at its forward end with a laterally and inwardly projecting cover-forming extension, and the drawers in the aforesaid compartments, with each drawer provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, with the compartment of the extension of the upper drawer arranged to be covered by the aforesaid cover-forming extension of the top of the drawer-case in the inner and closed position of the last-mentioned drawer.

2. Cabinet-work for a sewing-machine table comprising a table-top; a suitably-supported drawer-case arranged in under an end of the table-top and comprising a horizontally-arranged top and a shelf arranged a suitable distance below the last-mentioned top, with the said top of the drawer-case provided at its forward end with a laterally and inwardly projecting cover-forming extension, and the drawer in the compartment formed between the shelf and the top of the drawer-case and provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, with the compartment of the extension of the drawer arranged to be covered by the aforesaid cover-forming extension of the top of the drawer-case in the inner and closed position of the drawer.

3. Cabinet-work for a sewing-machine table comprising a table-top; a suitably-supported drawer-case arranged in under an end of the table-top and comprising a compartment for a forwardly and rearwardly movable drawer, a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment.

4. Cabinet-work for a sewing-machine table comprising a table-top; a drawer-case arranged in under an end of the table-top and comprising a horizontally-arranged top and shelves spaced vertically to form compartments, with the top of the drawer-case attached to the table-top, and the drawers in the aforesaid compartments, with each drawer provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, and each shelf being provided at its forward end and inner side with a laterally and inwardly projecting extension arranged to afford bearing to the extension of the drawer on the said shelf.

5. Cabinet-work for a sewing-machine table, comprising a table-top; a drawer-case arranged in under an end of the table-top and comprising a horizontally-arranged top and a drawer-receiving compartment next below the last-mentioned top, with the drawer-top arranged next below the table-top and provided at its forward end and inner side with a laterally and inwardly projecting cover-forming extension, and a drawer in the said compartment, which drawer is provided at its forward end and left-hand side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer-top in the closed position of the drawer.

6. Cabinet-work for a sewing-machine table, comprising a table-top; a drawer-case arranged in under an end of the table-top and comprising a horizontally-arranged top frame and a drawer-receiving compartment next below the said top frame, with the latter arranged next below and removably attached to the table-top and provided at its forward end and inner side with a laterally and inwardly projecting cover-forming extension, and a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the top frame of the drawer in the closed position of the drawer.

7. Cabinet-work for a sewing-machine table, comprising a table-top; two drawer-cases arranged in under opposite ends respectively of the table-top and comprising each a horizontally-arranged top and a drawer-receiving compartment next below the said drawer-top, with the latter arranged next below the table-top and provided at its forward end and inner side with a laterally and inwardly projecting cover-forming extension; a drawer in the said compartment, which drawer is provided at its forward end and inner side with a

laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer-top in the closed position of the drawer.

8. Cabinet-work for a sewing-machine table, comprising a table-top; two drawer-cases arranged in under opposite ends respectively of the table-top and comprising each a horizontally-arranged top and a drawer-receiving compartment next below the said drawer-top, with the latter arranged next below the table-top; a drawer for the said compartment, and a central drawer arranged and extending between the drawer-cases and having a front pivoted vertically near one extremity to the table-top, with the upper portion of the said front projecting forwardly of the lower portion of the said front and arranged flush at its outer surface and corresponding in dimension vertically with the forward edges of the tops of the drawer-cases.

9. Cabinet-work for a sewing-machine table, comprising a table-top; two drawer-cases arranged in under opposite ends respectively of the table-top and comprising each a horizontally-arranged top and a drawer-receiving compartment next below the said drawer-top, with the latter arranged next below the table-top and provided at its forward end and inner side with a laterally and inwardly projecting cover-forming extension; a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer-top in the closed position of the drawer, and a central drawer arranged and extending between the extensions of the drawers of the two drawer-cases, said central drawer having a front pivoted vertically near one extremity to the table-top, with the upper portion of the said front projecting forwardly of the lower portion of the said front and arranged flush at its outer surface and corresponding in dimension vertically with the forward edges of the tops of the drawer-cases.

10. The combination, with the table-top of a sewing-machine table and the metal legs or frames arranged below the table-top a suitable distance from opposite ends respectively of the table-top, of drawer-cases arranged next below the table-top at the outer sides of the aforesaid legs or frames and comprising each a top arranged next below the table-top at the outer side of the adjacent leg or frame, and a drawer supported from each drawer-case next below the top of the said drawer-case and movable forwardly and rearwardly in opening and closing respectively, which drawer is provided at the forward end and inner side with a laterally and inwardly projecting extension which has a compartment and is arranged forward of and instrumental in concealing the adjacent leg or frame, and the top of each drawer-case being provided at its forward end and inner side with a laterally and inwardly projecting extension arranged to cover the compartment in the extension of the aforesaid drawer of the said case in the closed position of the drawer.

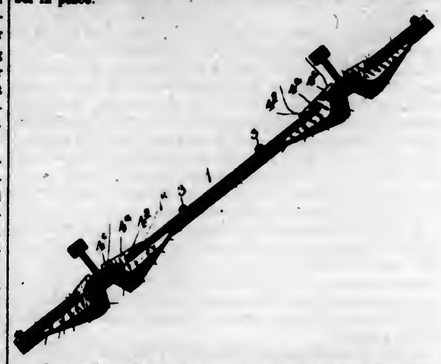
11. The combination, with the table-top of a sewing-machine table and the metal legs or frames arranged below the table-top a suitable distance from opposite ends respectively of the table-top, of drawer-cases arranged below the table-top at the outer sides of the aforesaid legs or frames, and a drawer supported from each drawer-case and movable forwardly and rearwardly in opening and closing respectively, which drawer is provided at the forward end and inner side with a laterally and inwardly projecting extension which has a compartment and is instrumental in concealing and abuts against the adjacent leg or frame in the closed position of the drawer.

12. The combination, with the table-top of a sewing-machine table and the metal legs or frames arranged below the table-top a suitable distance from opposite ends respectively of the table-top, of drawer-cases arranged below the table-top at the outer sides of the aforesaid legs or frames, and a drawer supported from each drawer-case and movable forwardly and rearwardly in opening and closing respectively, which drawer is provided at the forward end and inner side with a laterally and inwardly projecting extension arranged forward of and instrumental in concealing the adjacent leg or frame.

809,961. RAILWAY-TIE. JOHN P. LANGSNER, Cincinnati, Ohio, assignor of one-fourth to William H. Pridmore, Cincinnati, Ohio. Filed Apr. 27, 1905. Serial No. 257,782.

Claim.—1. A railway-tie member, a chair member adapted to be housed within said tie member, clamp members or levers, adapted to bear upon the under side of said tie member and to engage the rail base-flanges and a locking member effective to stride one of said clamp members and to interlock therewith and with said tie member and the base-flange of a rail.

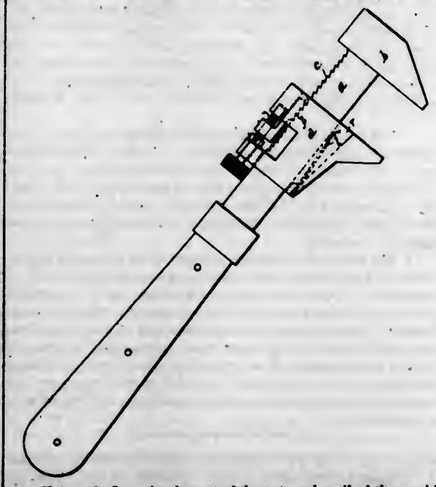
2. A railway-tie member, a chair member adapted to be housed within said tie member, clamp members or levers adapted to bear upon the under side of said tie member and to engage the rail base-flanges, and a locking member effective to stride one of said clamp members and having a reversely-curved end portion adapted to extend down through an opening in said tie member and in under the latter, and means for securing the opposite end of said locking member in place.



3. A railway-tie member, a chair member adapted to be housed within said tie member, clamp members or levers adapted to bear upon the under side of said tie member and to engage the rail base-flanges, and a locking member effective to stride one of said clamp members and to extend down through an opening in said tie member and means for securing the opposite end of said locking member in place.

4. A railway-tie member, a chair member adapted to be housed within said tie member, clamp members or levers adapted to bear upon the under side of said tie member and to engage the rail base-flanges, and a locking member having a slotted reversely-curved end portion, effective to stride one of said clamp members and to extend down through an opening in said tie member and means for securing the opposite end of said locking member in place.

809,962. WRENCH AND ANALOGOUS ARTICLE. OSCAR A. LAKE, Adrian, Mich. Filed Feb. 6, 1905. Serial No. 244,573.



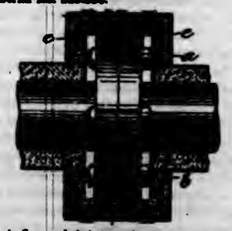
Claim.—1. In an implement of the nature described the combination of a shank provided with a fixed jaw and toothed upon the side thereof opposite said jaw, a sliding jaw provided with a sleeve passing entirely around said shank and movable longitudinally thereupon, and constructed with an open recess on the outside thereof forming two shoulders adjacent to the teeth of the shank, a dog engaged with said sleeve to engage the teeth of the shank having an arm extending into said recess, and a screw to engage said arm and the adjacent shoulders of the sleeve, the sleeve of the sliding jaw cut away on the side of the fixed jaw forming a wedge-shaped chamber to permit the sliding jaw to tilt upon the shank to permit the disengagement of the dog from the shank, and a free movement of the sliding jaw longitudinally upon the shank, the sliding jaw arranged to be tilted toward the fixed jaw by pressing the rear end of said screw toward said shank.

2. In an implement of the nature described the combination of a shank provided with a fixed jaw and toothed upon the side thereof opposite said jaw, a sliding jaw provided with a sleeve surrounding said shank and movable longitudinally thereupon and constructed with an open recess on the outer side thereof adjacent to the teeth of the shank, said sleeve provided with an orifice enlarged at the end thereof toward the fixed jaw and on the side of the fixed jaw, to permit the tilting of the sliding jaw, a dog engaged with said sleeve on the side thereof opposite the sliding jaw to engage the shank, a screw to engage the dog, and a spring within said orifice of the sleeve to hold the dog in normal engagement with the shank, whereby the dog may be lifted out of engagement with the shank by tilting the sliding jaw and moved longitudinally thereof substantially as set forth, the sliding jaw arranged to be tilted toward the fixed jaw by pressing the rear end of said screw toward the shank.

3. In an implement of the nature described, the combination of a shank provided with a fixed jaw and toothed on the side thereof opposite the jaw, a sliding jaw provided with a sleeve mounted on said shank and constructed with an open recess on the outer side thereof adjacent to the teeth of the shank and arranged to permit the tilting of the front end of the jaw upon the shank, a dog of rectangular form engaged within the recess of said sleeve, said dog having a toothed portion at its forward end projecting under the forward end of the sleeve, and a screw to engage the opposite end of the dog, said dog movable with the tilting of the jaw, the sliding jaw arranged to be tilted toward the fixed jaw by pressing the rear end of said screw toward the shank.

4. In an implement of the nature described the combination of a shank provided with a fixed jaw and toothed upon the side thereof opposite said jaw, a sliding jaw provided with a sleeve surrounding said shank and movable longitudinally thereupon, a dog engaged with said sleeve on the side thereof opposite the sliding jaw to engage the teeth of the shank, and a screw to engage the dog, the sleeve of the sliding jaw constructed to tilt upon the shank to permit the disengagement of the dog from the shank, and the free movement of the sliding jaw longitudinally upon the shank, said screw passing through the fixed jaw.

809,963. FLANGED-JOINT CASING FOR HEAT-INSULATING PIPES. MICHAEL J. LOUGHRAN, New York, N. Y. Filed Aug. 11, 1904. Serial No. 220,286.



Claim.—1. A flanged-joint casing comprising semicylindrical sections of heat-insulating character and embodying end flanges forming contracted openings, and a metal reinforce for each section and having turned-edge portions, said reinforce being positively combined with and reinforcing the peripheral portion and end flanges respectively, of its section.

2. A flanged-joint casing comprising semicylindrical sections of heat-insulating character and embodying end flanges forming contracted openings and regularly disposed with respect to the peripheral portions of their sections, and a metal reinforce for each section, having turned-edge portions, said reinforce being embedded between the inner and outer surfaces of the peripheral portion and end flanges respectively, of its section.

3. A flanged-joint casing comprising semicylindrical sections of heat-insulating character and embodying end flanges forming contracted openings and regularly disposed with respect to the peripheral portions of their sections, and a reinforce of wire fabric, for each section and having turned-edge portions, said reinforce being positively embedded in and reinforcing the peripheral portion and end flanges respectively, of its section.

4. A flanged-joint casing comprising semicylindrical sections of heat-insulating character and embodying end flanges forming contracted openings, a metal reinforce for each section and having turned-edge portions, said reinforce being positively combined with and reinforcing the peripheral portions and end flanges respectively, of its section, and a textile-fabric covering secured to the peripheries and end flanges of both sections, as well as to the contacting edges of said sections, said covering being disposed to form a flexible connection for both sections at one side and a joint-overlying flap at the other side.

809,964. CUSHION-TREAD AND THE LIKE FOR BOOTS AND SHOES. LOUIS R. LOEWENHERZ and HERBERT W. NEWTON, Boston, Mass. Filed Mar. 20, 1905. Serial No. 250,980.

Claim.—1. A cushion-tread for boots and shoes comprising, essentially a lift, a socket applied to the said lift, a sleeve or jacket removably fitting within the said socket, a cushioning-plug contained within the said sleeve or jacket, and one or more latches locking the sleeve or jacket and its contained plug within the said socket.

2. A cushion-tread for boots and shoes comprising, essentially, a lift, a socket seated within a hole in said lift, a cushioning-plug provided with an inclosing jacket entering the said socket, and one or more latches whereby the jacketed plug is removably locked in place within the said socket.

3. In a cushion-tread for boots and shoes, in combination, a block of cushioning material, a sleeve or jacket inclosing a portion of the length of the said block and provided with means for preventing withdrawal of the block therefrom, a lift, a socket applied to the said lift and within which the said sleeve or jacket removably fits, and one or more latches locking the sleeve or jacket and its contained plug in place within the sleeve.

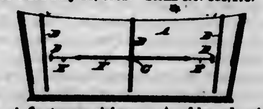
4. In a tread for boots and shoes, in combination, a lift, a socket seated within a hole in said lift and provided with means whereby it is secured against withdrawal, a plug removably fitting within the said socket, and one or more latches whereby the said plug is locked in place within the said socket.

5. In a cushion-tread for boots and shoes, in combination, a lift, a socket seated within a hole in said lift and radially enlarged at its inner end, whereby it is secured against withdrawal, a block of cushioning material, a sleeve or jacket containing said block, provided with an inwardly-projecting catch to retain the latter within the same, and removably fitting within said socket, and means to lock the said sleeve or jacket in place within the said socket.

6. A cushion-tread for boots and shoes comprising, essentially, a lift provided with a socket, a cushioning-plug provided with a sleeve or jacket removably fitting within the said socket, and one or more latches applied to the said sleeve or jacket and held by the cushioning material in engaging position, whereby the plug is secured within the socket through engagement of the latches with the latter.

7. A tread for boots and shoes comprising, essentially, a lift, a socket seated within a hole in said lift, a plug entering the said socket from the exterior of the latter, and one or more elastically-operated latches whereby the plug is retained in place within the socket.

809,965. FISHING DEVICE. ANDREW O. LUTHER, Eagle Lake, Minn. Filed Filed July 21, 1902. Serial No. 116,478.

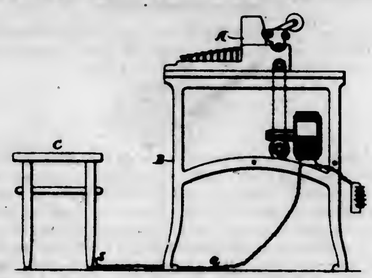


Claim.—1. A float comprising a pair of boards with their bottom edges weighted and arranged parallel and their lower portions diverging from each other, and braces for rigidly holding the boards in such position; in combination with a rod having a flexible connection at each end with the side of one of the boards, a ring slidable on the rod, and a fishing-line carried by the ring.

2. In a device of the character described, a float, a yielding spring-wire rod having a flexible connection at each end with the float, a ring slidable on the rod, and a fishing-line carried by the ring.

3. In a device of the character described, a fleet, a yielding spring-rod connected to the fleet in a horizontal position, a ring slidable on the rod, and a fishing-line passed through the ring, whereby the fleet may be trolled at a distance by means of the fishing-line and when the direction of pull is changed the yielding nature of the spring-rod causes it to bow to offer less resistance to the passage of the ring to the other end thereof.

809,966. STOPPING AND STARTING DEVICE FOR MOTOR-DRIVEN APPARATUS. WALTER B. MANEY, New York, N. Y., assignor to Pike Adding Machine Company, Orange, N. J., a Corporation of New Jersey. Filed Aug. 1, 1905. Serial No. 272,575.



Claim.—1. The combination with a machine and its motor and a movable stool for the operator, of a stopping and starting device arranged upon the stool to be shifted by the presence of the operator, and a flexible connection between said device and the motor, of a character to permit the stool to be shifted to different positions, substantially as set forth.

2. The combination with a machine, its electric motor and a movable stool, of a switch upon the stool, a spring separating the terminals of the switch and arranged to be compressed when the stool is occupied, and a flexible connection between the switch and motor, of a character to permit the stool to be shifted to different positions, substantially as set forth.

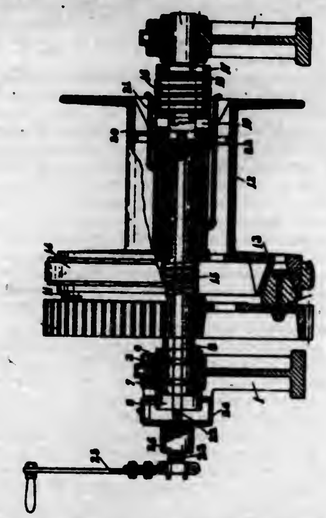
809,967. GATE. BENJAMIN H. MARTIN, Bay City, Mich. Filed Oct. 5, 1905. Serial No. 281,402.

Claim.—A gate and support comprising a pair of oppositely-located posts, a plurality of rigid catches projecting from one post, a plurality of brackets mortised into the remaining post and extending in a direction approximately opposite to that in which the catches extend, rollers swiveled in said brackets, an adjustable gate-frame supported on certain only of the rollers, one rail of the gate being projected beyond the frame and adapted to overlap one of the posts and rest in one of the catches to support the free end of the gate, the gate-frame adapted to be raised and lowered and to be supported on certain only of the rollers, the remaining rollers being out of use, the rail extension adapted to engage one or the other of the catches depending upon the position of the gate-frame.

809,968. ROPE-DRIVE. THOMAS S. MILLER, South Orange, N. J. Filed Feb. 21, 1903. Serial No. 144,423.

Claim.—1. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, an interposed clutch, automatically-operating mechanism revolving with the shaft whereby said clutch is set and manually-controlled mechanism whereby the same is unset.

2. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, an interposed clutch, a clutch-setting motor revolving with the shaft and a clutch-unsetting actuator having stationary bearings.



3. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, an interposed clutch, a clutch-setting motor revolving with the shaft and a manually-controlled mechanism whereby the clutch is unset.

4. In combination, the shaft, the driving member and rope-drum thereon, the interposed friction members, automatically-operating mechanism whereby said friction members are set and a thrust-pin in said shaft cooperating with said automatic mechanism.

5. In combination, the shaft, the driving member and rope-drum thereon, an interposed clutch, automatically-operating mechanism whereby said clutch is set and manually-controlled mechanism having a longitudinal movement on the shaft whereby the clutch is unset.

6. In combination, the shaft, the driving member, and rope-drum thereon, the interposed friction members, a spring interposed between the driving member and the drum tending to unset said friction members, a more powerful spring at the opposite end of said drum tending to set said friction members and mechanism whereby the pressure of the latter spring is controlled.

7. In combination, a driving and driven members, the interposed friction members, mechanism tending to set said friction members, mechanism tending to unset said friction members and means whereby the relative power exerted by said mechanisms may be controlled for the setting or unsetting of said friction members.

8. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, an interposed clutch, automatically-operating mechanism whereby said clutch is set, means whereby the power of said mechanism is adjusted and manually-controlled mechanism whereby said clutch is unset.

9. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, a clutch interposed between the drum and the driving member, a thrust-bearing carried by the shaft, automatically-operating mechanism for setting said clutch interposed between the thrust-bearing and the drum, and means whereby the power on said mechanism is adjusted and controlled.

10. In combination, a shaft, a driving member thereon, a rope-drum, an interposed clutch, a clutch-setting motor revolving with the drum and a manually-operated device extending through said driving member whereby said clutch is unset.

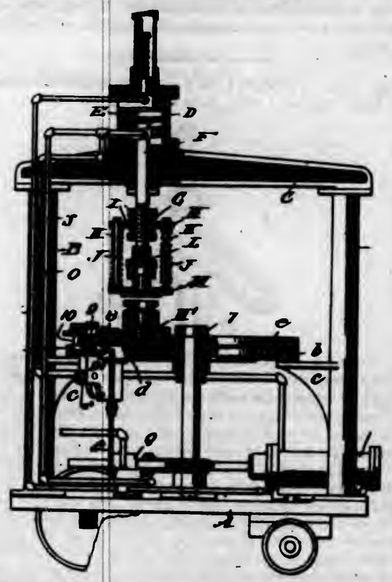
11. In combination, a revolving shaft, a driving member revolubly fixed thereon, a rope-drum revolubly loose thereon, an interposed clutch, a clutch-setting motor revolving with the shaft and a thrust-pin concentric with the shaft whereby the clutch is unset.

12. In combination, a longitudinally-fixed shaft, a driving member thereon, a rope-drum, an interposed clutch, an automatically-operating clutch-setting mechanism, a clutch-unsetting actuator having stationary bearings, a connection through which the clutch is unset by the movement of said actuator.

13. A rope-drum, in combination with the following controlling devices, viz: a friction-brake, a friction-clutch, an automatically-operating motor revolving with the drum whereby the clutch is set and a manually-operated device whereby the clutch is unset.

14. A rope-drum, in combination with the following controlling devices, viz: a friction-clutch, a clutch-setting spring having both its thrust-bearings rotating with the drum, and a manually-operated clutch-unsetting mechanism.

809,969. GLASS-MOLDING APPARATUS. MCCLELLAND MYERS, Mexico, Pa. Filed Mar. 23, 1905. Serial No. 251,499.



Claim.—1. In a glass-molding apparatus, a stationary table, a shaft journaled centrally of the table and extending therethrough, a second table held by the shaft and arranged over the stationary table, a ratchet fixed on the shaft beneath the stationary table, an arm arranged on the shaft, a dog carried by the arm to engage the ratchet, means for oscillating the arm, and molds carried by the movable table.

2. In a glass-molding apparatus, a stationary table, a shaft journaled centrally thereof and extending therethrough, a second table held by the shaft and arranged above the stationary table, a ratchet fixed on the shaft, a slotted arm arranged on the shaft, a dog carried by the arm to engage the ratchet, a rod, means passing through the slot of the arm to pivotally secure the rod to the arm, and means for reciprocating the rod.

3. In a glass-molding apparatus, a stationary table, a shaft journaled centrally thereof and extending therethrough, a second table held by the shaft and arranged above the stationary table, a ratchet fixed on the shaft, a slotted arm arranged on the shaft, a dog carried by the arm to engage the ratchet, a rod, means passing through the slot of the arm to pivotally secure the rod to the arm, a guide for the rod and fluid means for reciprocating the rod.

4. In a glass-pressing machine, a stationary table, a movable table thereon, means for rotating the movable table, molds on the movable table, means whereby the movement of the table actuates portions of the molds, means for alternately rotating and arresting the movable table, means for holding it in its arrested position, a suitably-operated presser and means whereby the table-arresting means controls the presser-operating mechanism and the table-operating mechanism.

5. In a glass-pressing machine, a stationary table, a table movable with relation to the stationary table, molds carried by the movable table, means whereby the movement of the table actuates certain portions of the molds, means for holding the tables in certain relation, a presser acting in conjunction with the top of the molds, means under the control of the table-holding device for projecting the presser and means for retracting the presser when the table is released.

6. In a glass-pressing machine, a stationary table, a movable table, molds carried by the movable table, means whereby the movement of the table actuates certain portions of the molds, means for holding the tables in certain relation, a presser acting in conjunction with the top of the molds, means under the control of the table-holding device for projecting the presser, means for retracting the presser when the table is released, and means for actuating the table at the time the presser is being retracted.

7. In a glass-molding apparatus, a stationary table, a movable table arranged thereover, molds carried by the movable table, means carried by the molds for both threading and ejecting, means for rotating the movable table, and means carried by the movable table acting in conjunction with the stationary table for operating the threading and ejecting means when the movable table is rotated.

8. In a glass-molding apparatus, a suitable frame, a stationary table thereon, a table movable with relation to the stationary table, molds carried by the movable table adapted to mold the article in its upright position, means for pressing the material from the exterior and top, means for actuating the presser, means for rotating the table, means for retracting the presser, means intermittently holding the stationary table in fixed relation to the movable table, means for releasing the movable table and means for simultaneously controlling the presser-operating mechanism and table-actuating mechanism.

9. In a glass-molding machine, a suitable frame, a stationary table supported thereon, camming-grooves in the table, a rotatable table acting in conjunction with the stationary table, means for intermittently rotating the table, means for intermittently retaining the rotatable table stationary, molds carried by the movable table, a presser acting in conjunction with the molds successively, means carried by the movable table and coacting with the camming-grooves of the stationary table for operating portions of the molds as and for the purposes described.

10. In a glass-molding apparatus, a stationary table, a shaft extending through the stationary table, a movable table on the shaft coacting with the stationary table, molds carried by the movable table, means on the molds for threading the article internally, means carried by the movable table whereby the threading apparatus is actuated, means whereby the rotation of the movable table with relation to the stationary table causes the actuation of the threading means, and means for intermittently rotating the table, substantially as described.

11. In a glass-molding machine, a suitable frame, a table supported thereon, camming-grooves in the table, a rotatable table acting in conjunction with the stationary table, a shaft on which the rotatable table is mounted, a ratchet-wheel on the shaft, a ratchet engaging the wheel, means for operating the ratchet to intermittently rotate the table, means for intermittently retaining the tables stationary, molds carried by the movable table, a presser acting in conjunction with the molds successively, means carried by the movable table and coacting with the camming-grooves of the stationary table for operating portions of the molds as and for the purposes described.

12. In a glass-molding machine, a stationary table, a movable table arranged thereover, molds carried by the movable table, threading-sleeves carried by the movable table and extending within the molds, means for rotating the movable table and means carried by the movable table acting in conjunction with the stationary table for operating the threading-sleeve and extract the same when the movable table is rotated.

13. In a glass-molding machine, a stationary table, a movable table arranged thereover, molds carried by the movable table, bolts carried by the table extending within the molds, a threading-sleeve rotatable on each of the bolts, means for rotating the movable table, means whereby the rotation of the movable table rotates the threading-sleeve, and ejecting means carried by the bolts.

14. In a glass-molding machine, a stationary table, a movable table arranged thereover, molds carried by the movable table, bolts carried by the table extending within the molds, a threading-sleeve rotatable on each of the bolts, means for rotating the movable table, means whereby the rotation of the movable table rotates the threading-sleeve, and ejecting means carried by the bolts, passing through the sleeves.

15. In a glass-molding machine, a stationary table, a movable table arranged thereover, molds carried by the movable table, bolts

carried by the table extending within the molds, a threading-sleeve rotatable on each of the bolts, means for rotating the movable table, means whereby the rotation of the movable table rotates the threading-sleeve, the upper portions of the bolts being reduced and passing through the sleeves.

16. In a glass-molding apparatus, a table, molds carried by the table, bolts carried by the table extending within the molds, a sleeve on each of the bolts, and means for reciprocating the sleeve on the bolt.

17. In a glass-molding apparatus, a table, molds carried by the table, bolts carried by the table extending within the molds, a sleeve on each of the bolts, and means for simultaneously reciprocating and rotating the sleeve on the bolt.

18. In a glass-molding apparatus, a table, molds carried by the table, bolts carried by the table extending within the molds, a sleeve threaded on each of the bolts, and means for rotating the sleeve on the bolt.

19. In a glass-molding apparatus, a table, molds on the table, bolts on the table extending within the molds, a sleeve threaded on the bolt, a pinion on the sleeve and means meshing with the pinion to rotate the sleeve on the bolt.

20. In a glass-molding machine, a movable table, molds on the movable table, a presser-head to coact with the molds successively, means for operating the head, means for intermittently moving the table, means for arresting the movement of the table, and suitable connections whereby the arresting means controls the operating means of the presser-head, and table-moving means.

21. In a glass-molding machine, a movable table, means for moving the table, a rod engaging the table to hold the table against movement, said rod having a notch, a spring-pressed rod engaging the notch when the rod is released from the table.

22. In a glass-molding machine, a movable table, means for moving the table, a rod engaging the table to hold the table against movement, said rod having a notch, a spring-pressed rod engaging the notch when the rod is released from the table, and means for disengaging the spring-lever from the notch.

23. In a glass-molding machine, a movable table, means for moving the table, a rod engaging the table to hold the table against movement, said rod having a notch, a spring-pressed rod engaging the notch when the rod is released from the table, and means whereby the movable table disengages the spring-lever from the notch.

24. In a glass-molding machine, a movable table, lugs on the table, means for moving the table, a rod normally engaging the table to arrest the movement thereof, means for releasing the rod from the table, a spring-pressed rod to engage the rod when released from the table, and a pivoted rod connected to the spring-rod, said pivoted rod being so arranged as to be engaged by the lugs of the movable table to release the spring-rod from the rod of the table.

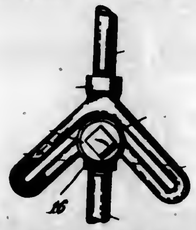
809,970. **DAMPER-LEVER FLANGE FOR PIANO-ACTIONS.** WILLIAM W. MCCALL, Kansas City, Mo., assignor of one-fifth to William F. Stone and one-fifth to Ursula L. McCall, both of Kansas City, Mo. Filed Jan. 3, 1905. Serial No. 239,213.

Claim.—1. The combination in a one-piece flange of a base portion, a neck portion extending from said base, a depending offset on said neck, an upwardly-curved spring portion extending from said offset, a lip on the end of said spring portion, and an overlapped strengthening portion on said base, substantially as set forth.

2. In combination with a suitable rail, a device of the class described comprising a base portion secured to said rail, a neck portion extending outwardly from said base, a curved offset portion depending from said neck, a curved spring portion continuing from said offset, and a lip on the end of said spring portion, substantially as set forth.

3. In combination with a suitable rail, a device of the class described comprising a base portion secured to said rail, a neck portion extending outwardly from said base, an offset portion depending from said neck, and a spring portion extending upwardly and inwardly from said offset, and a suitable lever having a perforation therein fitting over said spring and offset portions, substantially as set forth.

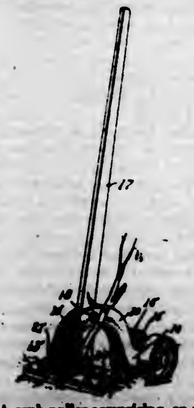
809,971. **PLUMBER'S TRAP.** JOHN F. MCCARTHEY, Worcester, Mass. Filed Jan. 2, 1904. Serial No. 187,412.



Claim.—1. As an article of manufacture, a plumber's trap comprising a cylindrical barrel with inclined return-bend passages opening into the sides of the barrel directly opposite each other, both of said return-bends lying in a single vertical plane, whereby the water entering the barrel through said bends will form two directly-opposed streams producing a scouring or cleaning action in the barrel.

2. As an article of manufacture, a plumber's trap consisting of a central horizontal barrel, inclined return-bend passages opening into the sides of the barrel directly opposite each other, and both of said return-bends being in one vertical plane, whereby the water entering the barrel through the return-bends will form two opposing streams producing a scouring action inside the barrel, and each of said return-bends being located entirely at one side of the vertical plane through the axis of the barrel, a connection for an outlet-pipe at one end of the barrel, and a clean-out plug at the other end of the barrel.

809,972. **GRUB-PULLER.** SAMUEL F. MCGOWN, Dixi, Ky. Filed Oct. 21, 1905. Serial No. 283,884.

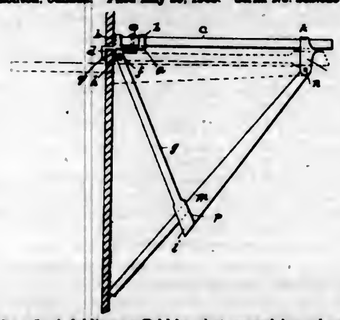


Claim.—1. A grub-puller comprising, an arched frame-piece, a jaw rigidly carried at one end of the frame-piece and an axle rigidly carried at the other, bearing-wheels mounted upon the axle, a lever pivoted to the frame, and a jaw rigidly carried by the lever in opposed relation to the jaw of the frame.

2. A grub-puller comprising, spaced and arched frame-pieces, a jaw rigidly carried at one end of the frame-pieces and an axle rigidly carried at the other spaced bearing-wheels mounted upon the axle and upon opposite sides of the frame-pieces, a lever pivoted to and between the frame-pieces, and a jaw carried rigidly by the lever in opposed relation to the jaw of the frame.

3. A grub-puller comprising, spaced and arched frame-pieces bent reversely outward at one end, a jaw member rigidly secured to the outturned end and disposed transversely of the frame, an axle rigid with and transverse of the frame at the end opposite the jaw, spaced bearing-wheels mounted upon the axle and upon opposite sides of the frame, a lever pivoted to and between the frame-pieces adjacent the crest of the arch, and a jaw rigidly carried by the lever in opposed relation to and parallel with the jaw of the frame.

809,973. **FOLDING SCAFFOLD-BRACKET.** JAMES MCINTYRE, Edmonton, Canada. Filed May 20, 1905. Serial No. 261,229.



Claim.—1. A folding scaffold-bracket comprising a horizontal supporting-arm, a folding supporting-brace jointedly connected with said arm toward the outer end thereof, a swinging brace jointedly connected with the supporting-arm toward the inner end thereof, said supporting-brace formed with a shoulder intermediate ends thereof and said swinging brace with a stirrup or loop to encircle the supporting-brace and to engage the shoulder to hold the two braces in working position, the supporting-arm provided with means for engaging the same in place upon a building.

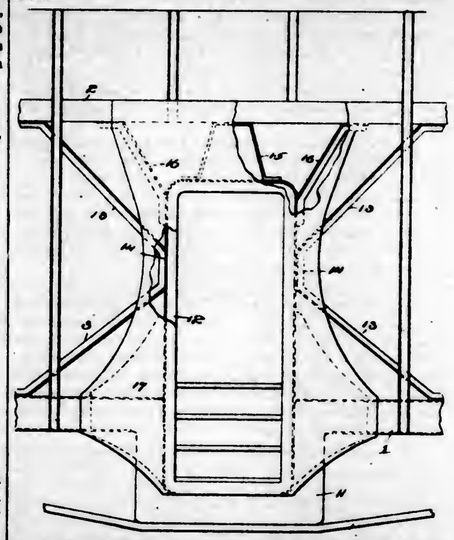
2. A folding scaffold-bracket comprising a supporting-arm, a folding supporting-brace, a coupling toward the outer end of the supporting-arm to which the supporting-brace is jointedly connected, a bracket-head upon the opposite end of the supporting-arm, and a swinging brace jointedly connected with the bracket-head, and provided with a stirrup at its opposite end encircling the supporting-brace, said supporting-brace provided with a shoulder to engage the stirrup, said bracket-head constructed to be engaged upon a building.

3. A folding scaffold-bracket comprising a supporting-arm, a folding supporting-brace, a coupling toward the outer end of the supporting-arm to which the supporting-brace is jointedly connected, a bracket-head upon the opposite end of the supporting-arm provided with bands spaced one from the other to receive the inner end of the supporting-arm, a swinging brace jointedly connected with the bracket-head and provided with a stirrup at its outer extremity encircling the supporting-brace, means passed through the inner end of the supporting-arm and bracket-head between said bands to connect said arm with the head, the supporting-brace provided with a shoulder to engage the swinging brace and said bracket-head constructed with a hook to engage the side of a building substantially as and in the manner described.

809,974. **TRUSS-FRAME FOR CARS.** WILLIAM R. MCKEEN, Jr., Omaha, Nebr. Filed May 10, 1905. Serial No. 260,507.

Claim.—1. In a car-frame, in combination, a continuous sill extending entirely about the lower portion thereof, a plurality of continuous longitudinal and cross members each of which is secured to said sill at two points and extends upwardly from one of said points across the car and thence downwardly to the other thereof and a longitudinal sill stretched directly between and secured to the ends of said first-mentioned sill said continuous sill comprising integral portions extending entirely about each end of the car-frame.

2. In a car-frame, in combination, a continuous sill extending entirely about the lower portion thereof, a continuous member substantially parallel to said sill and extending entirely about the upper portion of the car, a plurality of cross members each of which is secured to said sill at two points and extends upwardly adjacent said upper member from one of said points, across the car and thence downwardly to the other of said points and a longitudinal sill stretched directly between and secured to the ends of said first-mentioned sill, said side plate being rigidly secured to each of said cross members and being adapted to hold the same in fixed relative position.



3. In a car-frame, in combination, a sill, a plurality of cross members each of which is secured to said sill at two points and extends upwardly from one of said points, across the car and thence downwardly to the other of said points, a longitudinal member secured to said sill at each end thereof extending upwardly from said ends and throughout the length of the car, said longitudinal member resting outside and adjacent to said cross members and a rigid continuous member extending entirely about the upper portion of the frame and rigidly secured to said longitudinal and said cross members and adapted to maintain the same in fixed relative position.

4. In a car-frame, in combination, a continuous sill extending entirely about the lower portion thereof, a plurality of substantially straight members within said sill extending from one end to the other thereof, a plurality of continuous members each of which is secured to said sill at two points and extends upwardly from one of said points, across the car and thence downwardly to the other of said points and a rigid continuous member extending entirely about the upper portion of the frame and secured to each of said continuous members and adapted to hold the same in fixed relative position.

5. In a car-frame, in combination, an integral sill extending entirely about the lower portion thereof, and a plurality of substantially straight longitudinal members positioned within and stretched directly between the ends thereof.

6. In a car-frame, in combination, a sill curved about one end of the car, an upper member substantially parallel to said sill curved about said end, a cross member secured to said sill at two points and extending upwardly from one of said points, arched across the car, and thence downwardly to the other of said points, a longitudinal member secured to said sill adjacent the end thereof and extending upwardly and arched toward the center of the car, said longitudinal member passing adjacent said upper member and said cross member, and an arched brace extending from said upper member to said longitudinal member, said arched brace lying in a plane inclined with respect to that of said longitudinal member.

7. In a car-frame, in combination, an integral sill having a portion dropped below the main portion thereof, and a truss-rod secured to said sill at each side of said depressed portion and stretched under and in engagement with the same.

8. In a car-frame, in combination, upper and lower members, bars, of a door-frame interposed therebetween, a continuous brace

1. In a filing box or drawer front, a label-holder and a handle in contact with a layer of paper saturated with bicarbonate of sodi-

8. In a car-frame, in combination, upper and lower members, said lower member having a portion depressed below the main portion thereof, and a sheet provided with an opening, said sheet being secured to said upper member and to said lower member adjacent the depressed portion thereof.

9. In a car-frame, in combination, a sill having a portion depressed below the main portion thereof, an upper side plate, a door-frame fitted within said depressed portion of said sill, and braces, each of which is secured to said door-frame and extends upwardly and downwardly therefrom to said side plate and said sill respectively.

10. In a car-frame, in combination, a sill having a portion depressed below the main portion thereof, a side plate, a door-frame fitted within said depressed portion of said sill, a pair of braces secured to said frame each of which extends upwardly and downwardly therefrom and is connected with said side plate and said sill respectively, and means connecting the upper portion of said frame with said side plate.

11. In a car-frame, in combination, a sill having a rectangular portion depressed below the main portion thereof, a side plate, a door-frame fitting said depressed portion, a pair of braces each of which is secured at its central portion to one side of said door-frame and extends therefrom upwardly and downwardly to said side plate and said sill, a pair of braces from the upper portion of said frame to said upper side plate, and a member interposed between and secured to the top of said frame and said side plate.

12. In a car-frame, in combination, a continuous sill extending entirely about the lower portion thereof, said sill being provided with a portion depressed below the main portion thereof, a continuous upper member extending about the car, a plurality of continuous members each of which is secured to said sill at two points and extends upwardly from one of said points, across the car and thence downwardly to the other point of attachment, a door-frame secured within the depressed portion of said sill, and means connecting said frame with said upper member.

13. In a car-frame, in combination, a sill, a side plate, a plurality of continuous members each of which is secured to said sill at two points and extends upwardly from one of said points, across the car and thence downwardly to the other of said points, said sill being provided with a portion depressed below the main portion thereof, a door-frame within said depressed portion, and means connecting said door-frame with said side plate.

14. In a car-frame, in combination, a continuous sill extending entirely about the lower portion of the car and curved around it at the ends thereof, a continuous upper member extending entirely about the upper portion of said car substantially parallel to said sill, continuous longitudinal and cross members each of which is secured to said sill at two points and extends upwardly from one of said points, is arched across the car and thence extends downwardly to the other of said points, said longitudinal member passing adjacent said upper member and said cross members and said sill being provided with a portion depressed below the main portion thereof, a door-frame fitting within said depressed portion of said sill, a pair of braces each of which is secured to said door-frame at the sides thereof and extends upwardly and downwardly from said frame to said upper member and said sill respectively, and means connecting the upper portion of said frame with said upper member.

15. In a car-frame, a sill and an upper side plate extending about one end of the frame, a longitudinal rib secured to said sill at the front of said frame and extending upwardly adjacent said side plate and thence forwardly and curved ribs or braces inclined to the plane of said longitudinal rib and connecting the same with said side plate.

16. In a car-frame, the combination of a floor-sill formed of a continuous bolt, a roof-plate also formed of a continuous bolt, intermediate longitudinal lower sills extending throughout the length of and connecting the rounded end portions of the bolt-sill, a longitudinal rib connecting the rounded end portions of the bolt roof-plate, and transverse roof-ribs and vertical side studs, each of said roof-ribs being formed integral with and continuous of a side stud on each side of the frame, said plate being secured to each of said vertical side studs and being adapted to maintain the same in fixed relative position.

17. In a car-frame, the combination of a continuous sill formed with a depression intermediate its length, a door-frame fitted in said depression, a roof-plate above said door-frame and diagonal braces connecting the sides of said door-frame with said sill and with said roof-plate.

18. In a car-frame, the combination with upper and lower members, of a door-frame interposed therebetween, a continuous brace at each side of said door-frame connecting the same with said upper and lower members, inverted substantially U-shaped braces connecting the upper end of said door-frame with said upper member and diagonal braces connecting the corners of said door-frame with said upper plate.

19. In a car-frame, the combination of an integral sill formed with a depression intermediate its length, a door-frame mounted therein, and a truss-rod engaging said depression as a strut.

20. In a car-frame, in combination, an upper plate extending about the end of the frame, a longitudinal rib secured to said upper plate at the end of the frame and arched toward the center of the frame and a plurality of curved ribs inclined to the plane of said longitudinal rib and connecting the same with said upper plate.

21. In a car-frame in combination an upper side plate, a sill, said sill having a portion depressed below the main portion thereof, a rigid metallic frame fitted within and embraced by said depressed portion of said sill and means rigidly connecting the upper portion of said frame with said side plate.

22. In a car-frame in combination, an integral side sill formed with a substantially U-shaped drop intermediate its ends and a rigid metallic door-frame secured within and embraced by said dropped portion of said sill, said frame being positioned substantially within the plane of said sill.

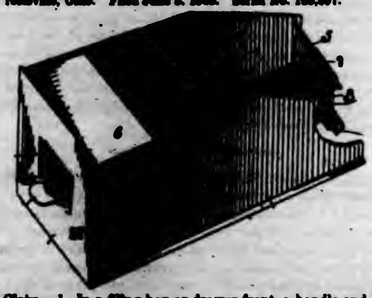
23. In a car-frame in combination a side sill having an integral portion depressed below the main portion of said sill and a rigid door-frame fitted within and embraced by and bracing the sides of the depressed portion of said sill, said frame being positioned substantially within the plane of said sill.

24. In a car-frame, in combination, an upper side plate curved about one end of the frame and a plurality of converging arched roof-ribs secured to said side plate and extending inwardly therefrom.

809,975. ANDIRON. JOHN T. MCLAIN, Stonypoint, N. C. Filed May 13, 1905. Serial No. 260,572.

Claim.—The combination of a pair of andirons, a cross-bar connecting said andirons at the upper front portions thereof, and a fender hanging on the rear side of said cross-bar and provided with depending fingers straddling said andirons, and with supporting-hooks engaging the cross-bar and extending forward to form handles, said fender being adapted to be swung rearward to move the fuel or to stir the fire.

809,976. FILING BOX OR DRAWER. REUBEN H. OREM, Cartersville, Ohio. Filed June 9, 1905. Serial No. 264,697.



Claim.—1. In a filing box or drawer front, a handle and label-holder integral with the front, the former being a portion of the front bent outside the box and the latter a portion thereof bent within the box.

2. In a filing box or drawer front, a label-holder and a handle integral with the front and consisting of portions bent in opposite directions from the body thereof, the portion containing the opening from which the handle is bent being bent to form a label-holder.

3. In a box or drawer, a front having a handle integral therewith and a label-holder integral therewith and formed of a single tongue extending each side of the handle.

809,977. FLEXIBLE PIPE. ARTHUR O'REAR, Chicago, Ill. Filed Feb. 2, 1903. Renewed Sept. 23, 1905. Serial No. 279,051.

Claim.—1. A flexible pipe comprising a plurality of sections each fitted together by means affording a universal joint and providing a central bore extending therethrough, and a spiral spring fitting closely to said sections and producing longitudinal compression of the pipe while holding the sections in operative relation.

2. A flexible pipe comprising a plurality of sections spherically concave on one side and complementally convex on the other, and provided with a central bore extending therethrough, said sections interfitting to provide a plurality of universal joints and a spiral spring fitted to said sections and producing longitudinal compression.

3. A flexible pipe comprising a plurality of sections spherically concave on one side and complementally convex on the other, and provided with a central bore extending therethrough, said sections interfitting to provide a plurality of universal joints and a spiral spring fitted to said sections and producing longitudinal compression, a bar integral with each section and affording connection for the ends of said spring.

4. A flexible pipe comprising a plurality of spherically-concave and spherically-convex members complemental each with the other, and adapted when brought together to afford universal joints and flexible means fitting closely thereto and acting to hold said sections in operative relation while producing longitudinal compression thereon.

5. A device of the class described comprising a plurality of interfitting sections together affording a plurality of universal liquid and fluid tight joints, flexible means fitting closely to said sections and acting to hold the same in operative relation and terminal fittings on said pipe adapted to afford connection with other parts of a pipe system.

809,978. ELECTRIC SAFETY-FUSE. HARRY L. OGLE, Peru, Ind., assignor to Peru Electric Manufacturing Company, Peru, Ind., a Corporation of Indiana. Filed May 26, 1904. Serial No. 209,511.

Claim.—1. An electric fuse consisting of an inclosing case provided with a main fuse connected with the terminals of the case, an auxiliary fuse connected to the main fuse, a layer of paper saturated with a sensitive chemical material adapted to be discolored upon blowing of the fuse, the auxiliary fuse being in contact therewith, and a covering of transparent material, substantially as set forth.

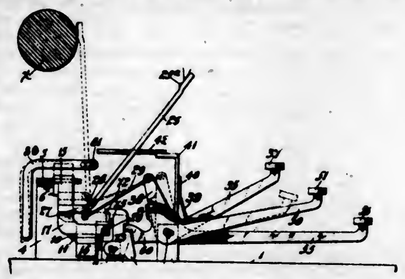
2. An electric fuse consisting of an inclosing case provided with a main fuse connected with the terminals of the case, an auxiliary fuse connected to the main fuse at each end and having an intermediate corrugated portion, a layer of paper saturated in a sensitive chemical material adapted to be discolored upon blowing of the fuse, the corrugated portion of the auxiliary fuse being in contact therewith, and a covering of transparent material, substantially as set forth.

3. An electric fuse consisting of an inclosing case provided with a main fuse connected with the terminals of the case, an auxiliary fuse connected to the main fuse, a layer of paper saturated in a sensitive chemical material adapted to be discolored upon blowing of the fuse, the auxiliary fuse being in contact therewith, and a covering of transparent material, with an outer wrapping device having a corresponding sight-opening, substantially as set forth.

4. An electric fuse consisting of an inclosing case provided with a main fuse connected with the terminals of the case, an auxiliary fuse connected to the main fuse, a portion of said auxiliary fuse being in contact with a layer of paper saturated with bicarbonate of sodium, with a covering of mica, substantially as set forth.

5. An electric fuse consisting of an inclosing case, provided with a main fuse connected with the terminals of the case, an auxiliary fuse connected to the main fuse, a portion of said auxiliary fuse being in contact with a layer of paper saturated in bicarbonate of sodium, with a covering of mica, and an outer wrapping having an opening adapted to correspond therewith, substantially as set forth.

809,979. TYPE-WRITING MACHINE. CHARLES H. PETTIBONE, Brooklyn, N. Y., assignor, by mesne assignments, to Mercantile Manufacturing Company, a Corporation of New York. Filed Sept. 12, 1903. Renewed May 5, 1905. Serial No. 259,027.



Claim.—1. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a group of key-bars operatively connected with the type-bar carrier, a plurality of stops independent of the connection between the key-bars and carrier, said stops being adapted to arrest the carrier in its normal and shifted positions, and means actuated by some of said key-bars for operating said stops, substantially as set forth.

2. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, and a key-bar suitably connected with said type-bar carrier, with a plurality of stops, one of which is arranged to normally engage the carrier for limiting its movement, while another of which is normally in disengaged position, and means for operating said stops, substantially as set forth.

3. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier and a group of key-bars, one of which is suitably connected with said type-bar carrier, with a plurality of stops, one of which is arranged to normally engage the carrier for limiting its movement, and another of which is normally in disengaged position, and means actuated by some of said key-bars for operating said stops, substantially as set forth.

4. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon the carrier, and a key-bar connected with the type-bar carrier, with a pair of limiting dogs or stops, and means for operating said dogs or stops, one of said dogs being formed with two engaging shoulders for arresting the carrier in two shifted positions, and the other of said dogs being formed with a single engaging shoulder for holding the carrier in a third or normal position, substantially as set forth.

5. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon the carrier, and a group of three key-bars, suitably connected with the type-bar carrier, with a pair of limiting dogs or stops, and means of engagement between two of said key-bars and said dogs or stops for operating them, one of said dogs being formed with two engaging shoulders for arresting the carrier in two shifted positions, and the other of said dogs being formed with a single engaging shoulder for holding the carrier in its normal position, substantially as set forth.

6. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a plurality of key-bars having a common connection with the type-bar carrier, dogs or stops independent of said connection and adapted to limit the movement of the carrier, and means actuated by some of said key-bars for shifting the position of the dogs or stops, substantially as set forth.

7. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a plurality of key-bars pivoted upon a common fulcrum and having a common connection with the type-bar carrier, dogs or stops independent of said connection and adapted to limit the movement of the carrier, means of engagement between the key-bars, and means operated by some of said

key-bars for shifting the position of the dogs or stops, substantially

being arranged in different vertical and horizontal planes, a shift-

having an opening for the passage of the film, and means controlled

inclosed fuse of limited resistance connected with said terminal con-

key-bars for shifting the position of the dogs or stops, substantially as set forth.

8. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a bell-crank key-lever connected with said carrier, key-levers arranged upon opposite sides of said bell-crank key-lever and formed with inwardly-projecting fingers which are adapted to engage said bell-crank, and a pair of limiting dogs or stops operated by said key-levers, substantially as set forth.

9. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a bell-crank key-lever connected with said carrier, key-levers arranged upon opposite sides of said bell-crank key-lever and formed with inwardly-projecting fingers which are adapted to engage said bell-crank, a pair of carrier-limiting dogs or stops, and arms projecting from the outer key-bars and operatively engaging said dogs or stops, substantially as set forth.

10. In a type-writing machine, the combination of a shiftable carrier supporting a type-bar, a pair of pivotally-mounted dogs or stops adapted to limit the movement of the type-bar carrier, pivotally-mounted key-bars formed with rearwardly-projecting fingers which engage said dogs or stops for operating them, and means connecting said key-bars with the carrier, substantially as set forth.

11. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a pair of pivotally-mounted dogs or stops adapted to limit the movement of the carrier, two pivotally-mounted key-bars formed with rearwardly-projecting fingers which engage said dogs or stops for operating them, a third pivotally-mounted key-bar, means connecting said third key-bar with the carrier, and means of engagement between the dog-operating key-bars and said third key-bar, substantially as set forth.

12. In a type-writing machine, the combination of a shiftable carrier carrying a type-bar, a pair of pivotally-mounted dogs formed with rearwardly-projecting carrier-engaging shoulders, and forwardly-presented slots or recesses, a pair of pivotally-mounted key-bars having rearwardly-projecting fingers which engage in said forwardly-presented recesses of the dogs, and means operatively connecting said key-bars with the carrier, substantially as set forth.

13. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a pair of pivotally-mounted dogs formed with rearwardly-projecting carrier-engaging shoulders, and forwardly-presented slots or recesses, a pair of pivotally-mounted key-bars having rearwardly-projecting fingers which normally engage in said forwardly-presented recesses of the dogs, and are adapted to move out of the recesses into engagement with the forward faces of the dogs to rock the dogs upon their pivots and lock them in their carrier-engaging position, and means operatively connecting said key-bars with the carrier, substantially as set forth.

14. In a type-writing machine, the combination of a shiftable carrier, a type-bar mounted upon said carrier, a pair of limiting dogs or stops pivotally mounted upon the base of the machine, each dog being formed with a downwardly-presented lug, a rearwardly-presented carrier-engaging shoulder, and a forwardly-presented slot or recess, a pair of key-bars pivotally mounted upon the machine-frame and formed with rearwardly-projecting fingers engaging the slots or recesses of the dogs, and means operatively connecting said key-bars with the type-bar carrier, substantially as set forth.

15. In a type-writing machine, the combination of a vertically-shiftable carrier formed with guide portions and a stop portion, guide-plates in which said carrier is slidingly mounted, a type-bar pivoted upon said carrier, a key-bar connected with the type-bar and adapted to move the type-bar and carrier through its type-bar connection, and dogs adapted to engage said stop portion for limiting the movement of the carrier, substantially as set forth.

16. In a type-writing machine, the combination of the parallel horizontal guide-plates 5, 10, formed with vertical guide-slots 6, 11, a vertically-shiftable carrier formed with rectangular oppositely-extended guiding or plate portions 15, 16, which operate in the slots 6, 11, of the guide-plates, a type-bar mounted upon the carrier, a key-bar connected with the carrier, and means for limiting the movement of the carrier, substantially as set forth.

17. In a type-writing machine, the combination of horizontal guide-plates formed with vertical guide-slots, a vertically-shiftable carrier formed with rectangular guiding or plate portions which operate in the slots of the guide-plates and a forwardly-projecting stop-finger, a type-bar pivoted upon the carrier, a key-bar connected with the type-bar, and dogs adapted to engage the stop-finger for limiting the movement of the carrier, substantially as set forth.

18. In a type-writing machine, the combination of the horizontal guide-plates formed with vertical guide-slots, said guide-plates being arranged in different vertical and horizontal planes, a shiftable carrier formed of two connected rectangular or plate portions which operate in the slots of said guide-plates, a type-bar mounted upon said carrier, a key-bar connected with said carrier, and means for limiting the movement of the carrier, substantially as set forth.

19. In a type-writing machine, the combination of a vertically-shiftable carrier formed with a forwardly and laterally projecting stop-finger, a type-bar mounted upon said carrier, a key-bar connected with said carrier, a stop-dog adapted to engage the stop-finger of the carrier, and means for operating said stop-dog, substantially as set forth.

809,980. ROLLER-SKATE. EDVARD PETTERS, Upsala, Sweden. Filed Oct. 26, 1905. Serial No. 284,263.

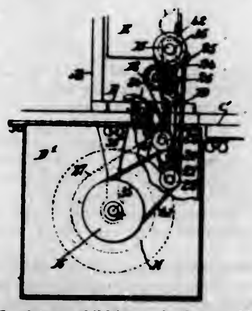
Claim.—1. In a device of the character described, a pair of crossed arms pivotally connected together, wheels journaled on the lower ends of said arms, a treadle or foot-plate located below the point of pivotal connection of the arms and suspended from the upper ends of the arms, and means whereby the separation of the lower ends of the arms imparts rotary motion to one of the wheels, substantially as described.

2. In a device of the character described, a pair of crossed arms pivotally connected together and each consisting of two members, cross-rods connecting said members, wheels carried at the lower ends of said arms, a foot-piece or treadle suspended from the cross-rods, and driving connections to one of the wheels operated by the spreading of the arms, substantially as described.

3. In a device of the character described, a pair of pivoted arms, a foot-piece supported by said arms, a driving-wheel carried at the lower end of one arm, driving connections to said wheel operated by the spreading of the arms and a steering-wheel pivotally carried by the other arm, substantially as described.

4. In a device of the class described, a pair of arms pivotally connected together, wheels at the lower ends of said arms, driving connections to one of said wheels for rotating it when the arms are separated, means for normally keeping said arms pressed toward each other, a foot-piece carried by said arms adapted to receive the pressure of the foot to separate said arms, and locking means for holding said foot-piece depressed and the arms separated, substantially as described.

809,981. APPARATUS FOR EXHIBITING MOVING PICTURES. NICHOLAS POWER, New York, N. Y. Filed Mar. 6, 1904. Serial No. 197,261.



Claim.—1. In picture-exhibiting and other machines, a spool upon which a web is to be wound, a spindle for said spool, a driving-pulley for the spindle, said pulley comprising a section fast upon the spindle and a tension-controlled section also mounted on said spindle and adapted to rotate independently of the other section, and a belt for imparting motion to said pulley and said spindle.

2. In picture-exhibiting apparatus, a flame-shield comprising a non-inflammable plate disposed adjacent to the light-aperture and

having an opening for the passage of the film, and means controlled by the tension upon the film for preventing a flame from following the film through the opening in the plate.

3. In picture-exhibiting apparatus, a flame-shield comprising a non-inflammable plate arranged adjacent to the danger-point, and a valve controlled by the tension upon the film for preventing flame from following the film beyond the plate.

4. In picture-exhibiting machines, a film-receptacle having an opening therein, and a device controlled by the tension upon the film to prevent a flame from following the film through the opening in the receptacle.

5. In picture-exhibiting machines, a receptacle for a spool of film, an opening in said receptacle through which the film passes, a chute surrounding the said opening, and a damper-valve partially within the said receptacle and partially within the said chute, and having normal bearing against a film passing through the said opening in the receptacle, as described.

6. In picture-exhibiting machines, a receptacle for a spool of films, having an opening therein and a chute around the opening, a damper or cut-off valve extending through the opening into the said chute and having the end within the chute adapted for light frictional engagement with the film, the opposite end of the said damper or cut-off valve being weighted, as described.

7. A moving-picture apparatus provided with a flame-shield, comprising a non-inflammable plate arranged above the light-aperture in proximity to the danger-point and adapted to protect the portion of the film above said aperture from the flames when the portion of the film in front of the same is on fire.

8. In picture-exhibiting machines, a film-receptacle having an opening in the wall thereof for the passage of the film, means for supporting a spool of film within the receptacle, and automatically-operative means for preventing the passage of a flame through the opening into the interior of the receptacle.

9. In picture-exhibiting machines, a film-receptacle having means for supporting the spool of film within the receptacle and having an opening in the wall for the passage of the film, of a valve in close proximity to said opening and through which the film passes.

10. In picture-exhibiting machines, a film-receptacle having means for rotatably securing a spool of film therein, and having an opening in the wall for the passage of the film, and a device controlled by the tension upon the film for preventing the passage of flame through the opening and into the receptacle.

11. In picture-exhibiting machines, a receptacle for a spool of film having an opening for the passage of the film, a spindle extending into the receptacle and adapted to receive a spool of film, automatically-operative means for preventing the passage of a flame through the opening and into the interior of the receptacle, and means outside of the receptacle for rotating the spindle to wind film upon the spool.

12. In picture-exhibiting machines, a film-receptacle adapted to protect the film from fire and having an opening for the passage of the film, automatically-operative means for preventing the passage of the flame through said opening, a spindle extending within the receptacle and adapted to receive a spool of film, and means outside of the receptacle for rotating the spindle to wind the film upon the spool, said rotating means being adapted to maintain a substantially uniform tension upon the film.

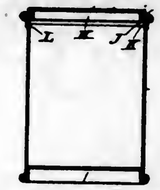
13. In moving-picture machines, the combination with a pair of film-spools arranged on opposite sides of the light-aperture, of a receptacle for each spool adapted to protect the film thereon from fire, each receptacle having an opening for the passage of the film, and automatically-operative means associated with each receptacle for preventing the passage of flame through the opening and into the receptacle.

14. In moving-picture machines, the combination with a pair of film-spools arranged on opposite sides of the projection-aperture, of a receptacle for each spool adapted to protect the film thereon from fire, each receptacle having an opening for the passage of the film, automatically-operative means associated with each receptacle for preventing the passage of a flame through the opening and into the receptacle, and means associated with one of the receptacles for rotating the spool therein to wind the film thereon.

809,982. ELECTRIC SAFETY-FUSE. CHARLES W. EDWARDS, Peru, Ind., assignor to The Peru Electric Manufacturing Company, Peru, Ind., a Corporation of Indiana. Filed May 25, 1904. Serial No. 209,512.

Claim.—In an electric fuse, the combination of a cylindrical shell or casing provided with similar terminal circuit-contacts, an inclosed fuse of limited resistance connected with said terminal contacts, an outer spring device secured on the side of the main shell adapted to be bent down against the surface thereof for its full length, a thread device attached to the end of said spring passing through an opening in the shell and looped around the fuse, adapted to retain the spring in a retracted position closely against the shell under tension, and to allow it to rise with the thread device exposing both the spring and thread to view, upon burning of the fuse, substantially as set forth.

809,983. CAN. JOHN F. ROSS, Toronto, Canada, assignor to William Edwin Ross, Percy Forster Ross, and Charles Fred Vanhorn, Toronto, Canada. Filed Sept. 2, 1904. Serial No. 223,161.



Claim.—1. A can-body comprising a blank of sheet metal bent into cylindrical form, the said can-body for a suitable distance from its top downward being enlarged so as to form an inward-projecting annular shoulder, and soldering material filling the joint on the inside of said can-body so that it will be flush with the inner surface thereof, the walls of said can-body, from said shoulder downward being parallel to each other, the walls of said can-body from said shoulder upward being parallel to each other, the upper edges of said can-body being provided with an outwardly-turned beading, and a circular lid or cover comprising the top integrally provided on its edge with an annular flange which overhangs an inwardly-formed portion with which is integrally formed an outwardly-extending flange with which is integrally formed a downwardly-extending flange which tightly fits against the whole of the inner circumference of said can-body it is in contact with above said inwardly-projecting annular shoulder so as to make same oil and water tight, the relation of the outside diameter of the top of said lid to the internal diameter of said can-body being such that there is an annular space left between the annular flange of said lid and the upper edge of said can-body.

2. A circular lid or cover comprising the top integrally provided on its edge with an annular flange which overhangs an inwardly-formed portion with which is integrally formed an outwardly-extending flange with which is integrally formed a downwardly-extending flange, the diameter of said lid being greatest when measured through said downwardly-extending flange.

809,984. HAY-ELEVATOR. DAVID B. ROWLAND and PETER BACHER, Canton, Ohio, assignors to The Hay Manufacturing Company, Canton, Ohio, a Corporation of Ohio. Filed May 9, 1904. Serial No. 207,267.

Claim.—1. In a hay-elevator of the class described, a track or way provided with a stop-block, a carriage adapted to travel thereon, said carriage provided with non-swiveled and swiveled portions, the swiveled portion thereof provided with locking-dogs spaced from each other and carried by the swiveled portion of the carriage-frame, said dogs provided with hooked ends, and arms spaced from said hooked lower ends, an elevating-head carrying a pulley, and said elevating-head provided with lateral axial projections, and grooves arranged to receive the lateral axial projections, substantially as and for the purpose specified.

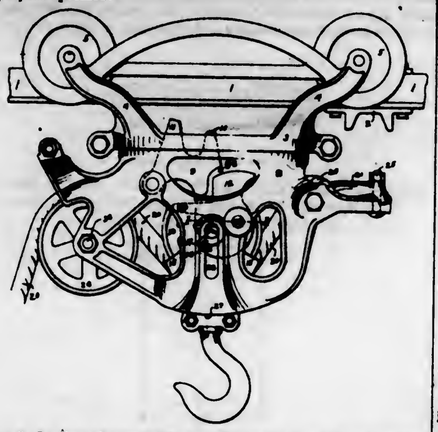
2. In a hay-elevator of the class described, a track or way and a stop-block secured thereto, a carriage adapted to travel upon the track or way, said carriage consisting of frames swiveled together, the swiveled portion of said frame provided with a flaring opening at its lower portion, grooves leading from said flaring opening, an elevating-head provided with axial projections adapted to enter the flaring opening, dogs spaced from each other and pivoted to the

frame, said spaced dogs provided with arms adapted to be engaged by the lateral axial projection of the elevating-head, and hooks on the upper portions of said arms, a sleeve slidingly embracing the

2. In tire and other valves, a valve member having an ingress-duct, a valve-seat, and a valve-chamber, within its interior and a

projectiles, the method herein described which consists in charging

frame, said upsead dogs provided with arms adapted to be engaged by the lateral axial projection of the elevating-head, and hooks adapted to engage the lateral axial projections of the elevating-head, and a dog adapted to lock the upsead dogs in engagement with the axial projections of the elevating-head, substantially as and for the purpose specified.



3. In a hay-elevator of the class described, a track or way, a carriage adapted to travel upon said track or way, a rope-clamp fixed to the frame of the carriage and adapted to clamp the rope, an elevating-rope and an elevating-head, pulleys carried by the elevating-head and the carriage, said pulleys mounted upon sleeves having oblique ends and oblique shoulders adapted to abut against the oblique ends of the sleeves, substantially as and for the purpose specified.

4. In a hay-elevator of the class described, a track or way, a stop-block fixed thereto, a carriage adapted to travel upon said track or way, said carriage consisting of an upper section and a lower section, the upper and lower sections swiveled together in a horizontal plane, the swiveled portion of said frame provided with hollow studs, dogs mounted upon the hollow studs and in spaced relation to each other, said dogs adapted to engage the elevating-head and release the locking-dog from the stop-block of the truck or way all arranged, substantially as and for the purpose specified.

5. In a hay-elevator of the class described, a carriage mounted upon a track, a clamp provided with downward-extending flanges, and a rib, said clamp adapted to engage the elevating-rope, and an elevating-rope located between the clamps and the carriage-frame, substantially as and for the purpose specified.

6. The combination of a hay-carrier, of an elevating-head carrying a pulley, the frame of said elevating-head provided with lateral projections, locking-dogs mounted on the carrier and adapted to swing longitudinally to the carrier-frame and from a common center transverse to the carrier-frame and adapted to engage the projections on the elevating-head, said dogs provided with arms, and closed grooves adapted to receive and guide the lateral projections, substantially as and for the purpose specified.

809,885. INCANDESCENT-ELECTRIC-LAMP REMOVER, REPLACER, AND CLEANER. CHARLES J. REDDOCK, Kansas City, Mo. Filed July 24, 1905. Serial No. 271,126.

Claim.—1. In a device of the character described, a handle provided at its upper portion with longitudinal grooves and openings, resilient arms arranged in said grooves and having their lower portions extending through the openings, the lower terminals of said arms being bent upwardly against the outer surface of the handle, shoulders on the upper portions of said arms, a sleeve slidingly embracing the handle and the arms to regulate the tension of the latter, the movement of said sleeve being limited by the lower terminals of the arms and the shoulders, and resilient loops carried by the upper portions of the arms, substantially as described.

2. In a device of the character described, a handle provided at its upper portion with longitudinal grooves and openings, resilient arms arranged in said grooves and having their lower portions extending through the openings, the lower terminals of said arms being bent upwardly against the outer surface of the handle, shoulders on the upper portions of said arms, a sleeve slidingly embracing the handle and the arms to regulate the tension of the latter, the movement of said sleeve being limited by the lower terminals of the arms and the shoulders, resilient loops carried by the upper portions of the arms, and a guide-cup arranged between the lower portions of the loops and provided with a centrally-disposed opening, substantially as and for the purpose specified.

3. In a device of the character described, a handle provided at its upper portion with longitudinal grooves and openings, resilient arms arranged in said grooves and having their lower portions extending through the openings, the lower terminals of said arms being bent upwardly against the outer surface of the handle, shoulders on the upper portions of said arms, a sleeve slidingly embracing the handle and the arms to regulate the tension of the latter, the movement of said sleeve being limited by the lower terminals of the arms and the shoulders, resilient loops carried by the upper portions of the arms, and a guide-cup arranged between the lower portions of the loops and provided with a centrally-disposed opening, for the purpose set forth and described.

4. In a device of the character described, a handle provided at its upper portion with longitudinal grooves and openings, resilient arms arranged in said grooves and having their lower portions extending through the openings, the lower terminals of said arms being bent upwardly against the outer surface of the handle, shoulders on the upper portions of said arms, a sleeve slidingly embracing the handle and the arms to regulate the tension of the latter, the movement of said sleeve being limited by the lower terminals of the arms and the shoulders, resilient loops carried by the upper portions of the arms, and flexible tubing covering the entire surface of the loops, substantially as described.

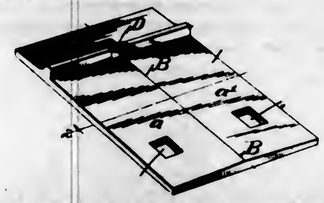
809,886. TIRE AND OTHER VALVES. GEORGE H. F. SCHRADER, New York, N. Y., assignor to A. Schrader's Son, Incorporated, New York, N. Y., a Corporation of New York. Filed Feb. 6, 1897. Serial No. 622,297.

Claim.—1. In tire and other valves, a valve member comprising a complete valve, consisting of a shell having an ingress-duct leading through its outer end, a seat, a valve-chamber, a valve proper in said chamber closing against said seat and an egress-duct, inclosed in its interior, said shell having a smooth outer wall surrounding said chamber and fitting within the interior of a tire-tube, having a projecting flange outwardly of said wall, and a packing-recess R formed in the cylindrical wall of said shell inwardly of said flange, a ring of packing material surrounding said shell and fitting said recess and held against accidental escape by the lower side of said recess, and a union surrounding said flange for removably coupling said member to a tire-tube, and a valve proper within said chamber.

2. In tire and other valves, a valve member having an ingress-duct, a valve-seat, and a valve-chamber, within its interior, and a valve proper in said chamber, said member having an outer cylindrical wall surrounding said chamber, for fitting within the socket of a tire-tube, and having a projecting flange beyond said wall, for projecting across the end of such tube, said member having an annular recess R cut in the cylindrical surface of said shell inwardly of said flange and having a groove in said flange, and a packing-ring in said groove and recess held against accidental escape by the lower side of said recess and prevented from undue lateral expansion by the outer side of said groove, and a coupling surrounding said flange for separately coupling said member to such tube.

3. In tire and other valves, the combination with a metal tube adapted to be fixed to a tire, having a screw-thread and a long, smooth cylindrical socket having an aperture communicating between the socket and its tire end, of a valve member constituting a complete valve, having a shell having an ingress-duct, a valve-seat surrounding said duct, a valve-chamber, and an egress-duct, and having an external long, smooth wall below said seat fitting the socket in said tube with a sliding fit and inclosed throughout its major portion therein, said valve member having a flange projecting over the edge of said tire-tube, and having an annular recess in said shell and a groove on the under side of said flange, and a packing-ring in said groove and recess, a valve proper inclosed within said shell, and means separably coupling said valve member within the socket of said tube, whereby the valve proper is protected within said shell, and the shell is protected within said tube, said shell being of such a length relatively to the clear socket in said tube that it is entirely free or unsupported at its lower end to insure a leak-tight joint at said packing-ring.

809,987. TIE-PLATE. JOHN M. SELLERS, Chicago, Ill., assignor to Sellers Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed May 15, 1905. Serial No. 260,886.



Claim.—1. A tie-plate formed with a crown extending transversely of the rail, bearing-faces sloping in opposite directions from said crown to opposite edges of the plate, and a continuous rail-retaining flange extending transversely of said crown and provided with a continuous vertical face adapted to engage the edge of a rail-flange to prevent lateral displacement of the rail.

2. A tie-plate formed with a crown extending transversely of the rail, bearing-faces sloping in opposite directions from said crown to opposite edges of the plate, and a continuous rail-retaining flange extending transversely of said crown and provided with a continuous vertical face adapted to engage the edge of a rail-flange to prevent lateral displacement of the rail, said plate being provided with a spike-hole extending through said flange on said plate and arranged to receive a spike which will be thereby so located as to cooperate with said flange in retaining a rail in position.

809,988. INDICATING THE TRAJECTORY OF PROJECTILES. JOHN D. SEMPLE, Sewickley, Pa. Filed June 28, 1905. Serial No. 267,442.

Claim.—1. As an improvement in the art of indicating the trajectory of projectiles the method herein described, which consists in charging the projectile with a suitable material and causing a discharge of the material into the atmosphere by pressure applied from a source independent of said material during the flight of the projectile.

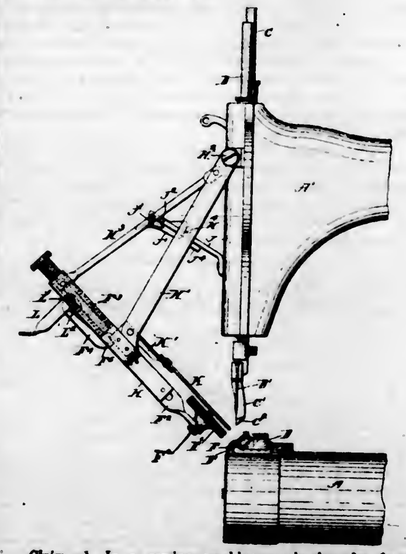
2. As an improvement in the art of indicating the trajectory of projectiles, the method herein described which consists in charging the projectile with a suitable material and a discharge of the material by applying thereto an expansive force from a source independent of said material during the flight of the projectile.

3. As an improvement in the art of indicating the trajectory of projectiles the method herein described, which consists in charging the projectile with a suitable material and causing a discharge of the material by subjecting it to centrifugal action during the flight of the projectile.

4. As an improvement in the art of indicating the trajectory of projectiles, the method herein described which consists in charging the projectile with a suitable material and causing a discharge of the material by a siphoning action.

5. As an improvement in the art of indicating the trajectory of projectiles, the method herein described which consists in charging a material into the projectile and causing the material to flow from the projectile by rotating the latter independent of the material.

809,989. SEWING-MACHINE. ORA D. SHAW, Boston, Mass. Filed Mar. 9, 1903. Serial No. 147,014.



Claim.—1. In a sewing-machine mechanism for forming stitches, an adjustable work-support having an inclined face, a presser-foot having an inclined lower end adapted to act as a guide and gage, a movable feed device having an inclined working face parallel to the plane of the inclined face of the work-support, an inclined rotatable work-holding device yieldably held against the work and adapted to press the same against said feed device.

2. In a machine having mechanism for forming stitches, an adjustable work-support having an inclined face, a presser-foot having an inclined lower end adapted to form a guide and gage, a feed device having its face parallel to the plane of the inclined face of said support, a movable frame, a yieldable rotatable presser-foot on said frame, and means for regulating the said presser-foot.

3. An attachment for sewing-machines, having a vertically-movable needle, an adjustable work-support having an inclined face, a presser-foot having a beveled end adapted to form a guide, a feed device, a movable frame, a yieldable member on the latter and provided with a wheel forming a presser-foot, means for moving said member, and means for holding the frame in a fixed position.

4. In a sewing-machine, a stitch-forming mechanism, a presser-foot having an inclined end, a swinging frame having a movable support, a rotatable presser-foot carried by the latter, a work-support having an inclined face, a feed device, means for locking the frame in a fixed position, and means for holding said support in an operative position.

5. In a sewing-machine, a stitch-forming mechanism, a presser-foot having an inclined end, a work-support having a recessed

curved inclined face, a feed device provided with an inclined face, a pivotally-connected frame, a movable bar yieldingly supported therein, a rotatable presser-foot and a guide-plate carried on said bar, a hand-operable means for actuating said bar, and means for holding said frame in a fixed position.

6. In a sewing-machine, mechanism for forming stitches, a work-support having an inclined face, a presser-foot having an inclined lower end and adapted to act as a guide and gage, a feed device having a working face parallel to the plane of the inclined face of the work-support, an inclined rotatable work-holding device yieldingly held against the work and adapted to press the same against said feed device.

7. In a sewing-machine, mechanism for forming stitches, a work-support having an inclined face, a presser-foot having an inclined end and adapted to act as a guide and gage, a feed device having its working face parallel to the plane of the inclined face of the said work-support, a swinging frame pivoted to the head of the machine, an inclined rotatable presser-foot wheel on said frame adapted to act with the said feed device, and means for holding said swinging frame in a fixed position.

8. In a sewing-machine, mechanism for forming stitches, a work-support having an inclined face, a presser-foot having an inclined lower end and adapted to act as a guide and gage, a feed device having a working face parallel to the plane of the face of the work-support, a swinging frame pivoted to the head of the machine, an inclined rotatable presser-foot wheel on said frame adapted to act with the said feed device, an inclined holding and guide plate attached to said swinging frame, and means for holding said swinging frame in a fixed position.

9. In a sewing-machine, a feed device, a swinging frame attached to the head of the machine, an inclined rotatable presser-foot wheel adapted to act with said feed device, an inclined support and guide-plate adjustably attached to said swinging frame and coöperating with said wheel, and means for holding said swinging frame in a fixed working position.

809,990. **WINDOW-SASH.** JOHN H. SHEPHERD, Huron, Ohio. Filed Oct. 8, 1904. Renewed June 15, 1905. Serial No. 265,435.

Claim.—1. The combination, with a window-frame having a single vertical groove in each of its side portions, of channel-shaped guides provided with extension side flanges which form two parallel guide-grooves, said guides being secured in the said vertical grooves, slidable window-sashes, and flat guide-plates secured to the said sashes and engaging with the said guide-grooves.

2. The combination, with a window-frame having grooves in its side and top portions, of guides formed of spring sheet metal and secured in the said grooves, said guides being channel-shaped in cross-section and provided with extension side flanges which form guide-grooves, slidable window-sashes, and flat guide-plates secured to the said sashes and engaging with the said guide-grooves.

809,991. **DUSTLESS ATTACHMENT FOR BROOMS.** FRANK SHERMAN, Adaxeen, Iowa. Filed July 7, 1905. Serial No. 268,761.

Claim.—1. A device of the class described comprising a reservoir having opposed resilient wings adapted to engage the handle of a broom, a tubular spraying member adapted to be embedded among the fibers of the broom and provided with a plurality of spaced orifices for the escape of the liquid, and a feed-pipe between the reservoir and spraying member.

2. A device of the class described comprising a reservoir having means for detachably connecting to the handle of a broom, a tubular spraying member with the upper side in wedge form to facilitate the insertion among the fibers of the broom, and provided with a plurality of spaced orifices, and a feed-pipe between the reservoir and spraying member.

3. A device of the class described comprising a reservoir having means for detachably connecting to the handle of a broom, a tubular spraying member adapted to be embedded among the fibers of the broom and provided with spaced discharge-orifices and with perforated ears extending from the ends, a feed-pipe between said reservoir and spraying member, and a tie-wire attached at the ends in the perforated ears and extending around the brush portion of the broom.

809,992. **HEATER.** JACOB SILVERBERG, Pittsburg, Pa. Filed Mar. 16, 1905. Serial No. 250,621.

Claim.—1. A flat-iron heater comprising sides and ends, said heater being triangular in cross-section and formed with a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex extending from end to end.

2. A flat-iron heater comprising sides and ends, said heater being triangular in cross-section and formed with a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex extending from end to end and said openings on one side being adapted to break joint with the like openings on the opposite side.

3. A flat-iron heater comprising sides and ends, said heater being triangular in cross-section and formed with a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex extending from end to end and said iron-supports being pointed and curved for conforming in shape to the body portion of the irons.

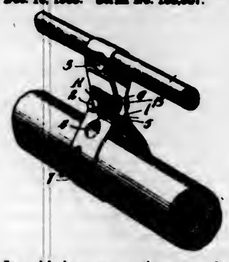
4. A flat-iron heater formed of sheet metal and comprising sides and ends, said heater having its sides formed from one piece of sheet metal and bent to form a triangular shape in cross-section and having a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex extending from end to end.

5. A flat-iron heater formed of sheet metal and comprising sides and ends, said heater having its sides formed from one piece of sheet metal and bent to form a triangular shape in cross-section and having a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex extending from end to end and said openings on one side being adapted to break joint with the like openings on the opposite side.

6. A flat-iron heater formed of sheet metal and comprising sides and ends, said heater having its sides formed from one piece of sheet metal and bent to form a triangular shape in cross-section and having a plurality of iron-supports on each side arranged side by side, and said heater being also provided with exit-openings at its apex

extending from end to end and said iron-supports being pointed and curved for conforming in shape to the body portion of the irons.

809,993. **CABLE-HANGER.** FREDERICK W. SONS, Ridgewood, N. J. Filed Dec. 16, 1903. Serial No. 185,267.

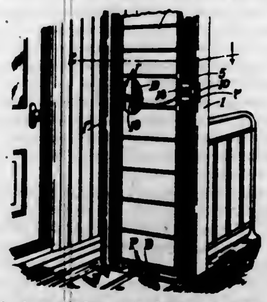


Claim.—1. In cable-hangers, a sinc strap formed with gripe and with keyhole-slots adjacent the ends of the same, a headed sinc stud rigidly riveted to said strap intermediate said slots, there being yieldable integral locking-flanges adjacent said slots to coöperate therewith and to prevent the accidental displacement of said stud in said slots.

2. In cable-hangers, a hanger-strap formed with keyhole-slots adjacent its ends, a headed stud rigidly secured to said strap intermediate said slots, there being movable locking-flanges formed adjacent said slots to coöperate therewith.

3. In cable-hangers, a sinc strap formed with gripe and with keyhole-slots adjacent the ends of the same, a headed sinc stud riveted to said strap between said slots, said strap being formed with yieldable integral locking-flanges adjacent said slots to substantially close said slots and to confine said stud in the reduced ends of said slots to prevent accidental displacement of the same.

809,994. **VESTIBULE-CURTAIN HOOK.** HENRY SPRINGER, St. Louis, Mo. Filed May 6, 1905. Serial No. 259,437.

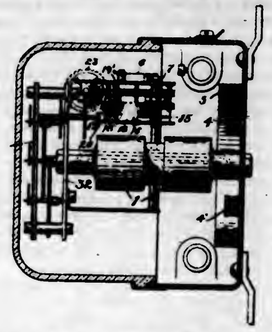


Claim.—1. A vestibule-curtain hook comprising a swinging hook on one car for engaging the free end of the curtain on the adjacent car, a suitable support for the hook, a pin passed through the hook and into the support for retaining the hook in position for engagement with the end of the curtain aforesaid, and a cord secured to the pin and adjacent car respectively for withdrawing the pin upon parting of the cars and thus releasing the hook and the curtain held thereby, substantially as set forth.

2. A vestibule-curtain hook comprising a swinging member or hook in one car, said member having a perforated base for the reception of a pin, a support for the hook, a socket formed in the support and registering with the perforation in the base and adapted to receive the pin passed through said perforation, a cord connecting the outer end of the pin to the adjacent car, said hook adapted to engage the free end of a curtain carried on the adjacent car, the parts operating substantially as and for the purpose set forth.

3. In a car, a post having a suitable pocket or cavity, a reinforcing-plate for the edges of the pocket, ears on said plate, a hook hinged between said ears and adapted to swing into and out of said pocket, the base of the hook being perforated for the reception of a suitable pin, the post having a socket at one end of the pocket adapted to register with the perforation when the hook is swung out of the pocket, means for coupling the pin to the adjacent car, the latter carrying a curtain whose free end is adapted to be connected to the hook when the latter is swung out of the pocket, the parts operating substantially as and for the purpose set forth.

809,995. **ELECTRIC METER.** WILLIAM STANLEY, Great Barrington, Mass. Filed Mar. 7, 1903. Serial No. 242,869.



Claim.—1. In a meter, the combination of a main series winding, an auxiliary winding at an angle thereto, a needle subject to the action of both windings, and having its axis of rotation substantially at right angles to the axes of both of said windings and means for periodically energizing said auxiliary winding so as to give the needle periodical impulses and maintain it in motion so long as current is passing through the series winding.

2. In a meter, the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at an angle relatively to that of the main winding, means for periodically energizing said auxiliary winding, and an oscillating needle within the influence of both windings, and having its axis of rotation substantially at right angles to the axes of both of said windings, and means for converting the oscillatory movement of the needle into rotary movement, and means for recording the amount of said rotary movement.

3. In a meter, the combination of a main series winding, an auxiliary winding at an angle thereto, a needle subject to the action of both windings, and means for periodically energizing said auxiliary windings by currents passed through said auxiliary winding alternately in opposite directions so as to give the needle periodical impulses and maintain it in motion when current is passing through the series winding.

4. In a meter, the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at an angle relatively to that of the main winding, an oscillating needle within the influence of both of said windings and means for energizing said auxiliary winding alternately in opposite directions so as to give said needle an impulse during its movement in each direction, and means for producing by said oscillating needle a rotary motion in one direction, and means for indicating the amount of said rotary movement.

5. In a meter, the combination of a main series winding, and an auxiliary winding at right angles thereto, an oscillating needle within the influence of both windings, and a commutator controlled by said needle for reversing the current through said auxiliary windings.

6. In a meter the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at right angles to the axis of said main winding, a swinging needle within the influence of both windings, and means for causing the current to pass through said auxiliary winding alternately in opposite directions, so as to assist in maintaining said needle in motion so long as current flows in said main winding.

7. In a meter, the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at right angles to the axis of said main winding, a swinging needle within the influence of both windings, and two resistances in series having a common point between at which one terminal of said auxiliary winding is connected, and means for causing said auxiliary winding then connected to shunt said resistances alternately.

8. In a meter, the combination of a main series winding 1, a shunt-winding 2, a needle 13 within the influence of both of said

windings, means for periodically energizing said auxiliary winding,

hundred and twenty degrees in phase, and on the other side by an

15. The method of electric distribution herein set forth, which

said magnetomotive forces three-phase currents whose potential is

windings, means for periodically energizing said auxiliary winding, abutments 18 18' oscillated by said needle, star-wheels 19 19' coöperating with said abutments and geared to each other and an integrating-train geared to said star-wheels.

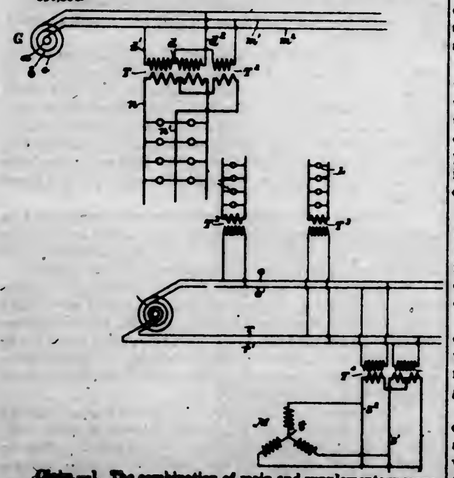
9. In a meter, the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at right angles to the axis of the main winding, a swinging needle within the influence of both windings, and two auxiliary resistances in series, having a common point between them at which one terminal of said auxiliary winding is connected, and means for causing said auxiliary winding thus connected to shunt said resistances alternately, and a high main resistance in series with said auxiliary resistances.

10. In a meter, the combination of a series winding, a shunt-circuit having a main and two auxiliary resistances therein, an auxiliary winding having one of its terminals connected to said shunt-circuit between said auxiliary resistances, a needle subject to the influence of both of said windings, means for registering an amount proportional to the number of oscillations of said needle, a toothed controlling member oscillating with said needle and connected to the other terminal of said auxiliary winding, two insulated and offset toothed members meshing with said toothed controlling member, and means for electrically connecting one of said two offset members first to the outside of one of said auxiliary resistances and then to the outside of the other of said auxiliary resistances.

11. In a meter, the combination of a main winding carrying the current to be measured, an auxiliary winding having its axis at an angle relatively to that of the main winding, an oscillating needle within the influence of both windings, a circuit containing two resistances having a common point between them to which one terminal of said auxiliary winding is connected, a toothed master member to which the other terminal of said auxiliary winding is connected, and insulated toothed portions electrically connected respectively to points on said shunt-circuit outside said resistances and adapted to be engaged by said geared master member, said insulated toothed members being offset relatively to one another.

12. In a meter, a series winding, a shunt-circuit having a main resistance 5 and two auxiliary resistances 4 4' therein, an auxiliary winding having one terminal connected between said auxiliary resistances, and a needle subject to both of said windings, and means actuated by said needle for connecting the other terminal of said auxiliary winding alternately with each of the outer terminals of said auxiliary resistances.

809,996. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES P. STEINMETZ, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Apr. 13, 1894. Serial No. 507,304.



Claim.—1. The combination of main and supplementary transformers, interconnected as described, with one terminal of the windings of the supplemental transformer coupled to a central point of the corresponding winding of the main transformer, and wound for such different ratios of transformation that the resultant electromotive forces on one side of the transformer differ by approximately one hundred and twenty degrees in phase, and on the other side by approximately ninety degrees.

2. The combination of a main transformer and a supplementary transformer connected to the main transformer at a point dividing the electromotive force of the main transformer into two substantially equal parts, and so proportioned that the resultant electromotive forces generated in the supplementary transformer and the respective halves of the main transformer are substantially equal to that of the main transformer, as described.

3. The combination with main and supplementary sources of electromotive force differing by substantially ninety degrees in phase, and interconnected with one terminal of the supplementary source coupled to a central point in the main source, and having relative values such that the resultant electromotive forces generated by the supplemental source and the respective halves of the main source are substantially equal to the electromotive force of the main source.

4. The combination in a system of electrical distribution, of a source of three-phase currents differing by substantially one hundred and twenty degrees in phase, with means for converting such currents into quarter-phase currents differing substantially ninety degrees in phase, and translating devices operated by the quarter-phase currents, as set forth.

5. In an apparatus for the transformation of multiphase alternating currents, the combination of two alternating-current transformers, with a connection from one end of one coil of one transformer with approximately the middle point of a coil of the other transformer.

6. An apparatus for transforming multiphase alternating currents in which the different currents bear a symmetrical phase relation to one another into a second system of multiphase alternating currents in which the phases are symmetrically related, which consists of two transformers, one coil or a portion thereof of one transformer being connected to an intermediate point in a coil of the second transformer.

7. In a system of transmitting power by electricity, the combination of means for producing two-phase currents, phase-transforming devices by which said two-phase currents are transformed into three-phase currents, line-circuits extending therefrom to a distance, and means located at said distant point or points by which said three-phase currents are utilized.

8. The combination of windings having an intermediate point of one connected to a terminal of another, means for generating in the active portions of said windings currents differing in phase by substantially ninety degrees, and leads upon which these currents appear combined as three-phase currents.

9. The combination of windings in which electromotive forces are adapted to be generated, and connections between an intermediate point of one winding and the other winding, the voltages of said windings being related to each other as the ratio between a side and altitude of an equilateral triangle.

10. The combination of two alternating-transformer windings, the active voltages of which have approximately the same ratio as that between a side and altitude of an equilateral triangle, connections between the lower voltage winding and the middle point of the other winding, and a system of conductors for conveying three-phase currents connected with the remaining terminals of said windings, and a system of conductors for conveying two-phase currents connected to the other transformer-windings.

11. The combination of two alternating-current transformers, a source of two alternating currents differing in phase ninety degrees, connections therefrom with the primary coils of said transformers, and a connection from one terminal of the secondary coil of one of said transformers with an intermediate point in the secondary of the other transformer.

12. The combination of two windings having one terminal of one of the windings coupled to an intermediate point in the other winding, and means for maintaining in said windings electromotive forces differing in phase from each other by substantially ninety degrees.

13. The combination of two windings, means for generating in each of the windings an electromotive force having a definite phase-angle with respect to the electromotive force generated in the other winding, a connection between one terminal of one of the windings and an intermediate point in the other winding, and leads extending from the free terminals of said windings.

14. The combination of a plurality of transformer-windings, and a connection between the end or approximately the end of one winding and approximately the middle point of another of said windings.

15. The method of electric distribution herein set forth, which consists in generating three-phase currents, transmitting the same to a desired point or points, converting such currents into quarter-phase currents, and utilizing such last-named currents for operating translating devices.

16. The method of electrical distribution, which consists in generating three-phase currents, transmitting the same to a desired point or points by interconnected circuits, converting such currents into quarter-phase currents, and distributing such last-named currents to translating devices by interconnected circuits, as set forth.

17. The method of rendering three-phase and quarter-phase current systems of electrical distribution convertible, which consists in resolving the electromotive forces constituting one such system into component electromotive forces substantially ninety degrees apart in phase, changing the relative value of the components so that when recombined they will form resultant electromotive forces having the desired difference of phase, and recombining such electromotive forces, as described.

18. The method of transmitting electric energy required for operating multiphase apparatus by alternating currents having two phases, which consists in transmitting three-phase alternating currents to a distance, transforming the same into two-phase alternating currents, and utilizing such transformed currents.

19. The method of transmitting electric energy required for operating multiphase apparatus by alternating currents having three phases, which consists in generating two-phase alternating currents, transforming the same into three-phase alternating currents, and transmitting the energy in the form of three-phase currents to a distance and there utilizing the energy thus transmitted.

20. The method of multiphase alternating-current distribution, which consists in generating alternating currents of a given number of phases, transforming the same into alternating currents of a greater number of phases, transmitting the alternating currents thus produced and utilizing the same.

21. The method of transmitting electrical energy to and utilizing the same at a distance, which consists in conveying over lines of conductors three or more alternating currents dephased with reference to each other, from a distant source to, or near the place of consumption, generating there, by the combined inductive action of these currents, two separate alternating magnetic fluxes in quadrature, and generating by the separate inductive influence of these fluxes electric working currents, substantially as described.

22. The method of transmitting electrical energy to and utilizing the same at a distance, which consists in conveying over lines of conductors three or more alternating currents, dephased with reference to each other, from a distant source to, or near the place of consumption, generating there, by the combined inductive action of these currents, two separate alternating magnetic fluxes in quadrature, and generating by the separate inductive influence of these fluxes two-phase alternating working currents, substantially as described.

23. The method which consists in generating alternating currents of a given number of phases, changing the potential of the currents thus generated and at the same time transforming the currents into alternating currents of a greater number of phases.

24. The method which consists in producing two-phase alternating currents, transforming the same into three-phase alternating currents, transmitting the energy in the form of three-phase alternating currents, and utilizing the energy thus transmitted.

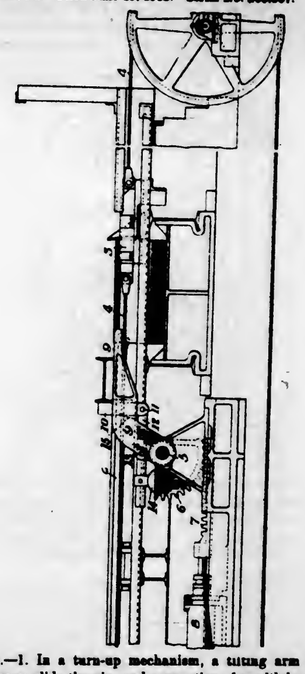
25. The hereinbefore-described method of multiphase distribution which consists in generating alternating currents of a given number of phases, changing the potential of the currents thus generated, and at the same time transforming the currents into alternating currents of a greater number of phases and transmitting the latter currents.

26. The method of transmitting power by electricity, which consists in producing two-phase alternating currents, producing thereby alternating magnetomotive forces of different phase, producing by said magnetomotive forces three-phase currents, and utilizing said currents.

27. The method of transmitting power by electricity, which consists in producing alternating currents of a determined number of phases, producing thereby alternating magnetomotive forces of different phase, producing by said magnetomotive forces alternating currents of a relatively greater number of phases, and utilizing said currents.

28. The method of transmitting power by electricity, which consists in producing two-phase alternating currents, producing thereby alternating magnetomotive forces of different phase, producing by said magnetomotive forces three-phase currents whose potential is changed in relation to the primary currents, and utilizing the energy of said three-phase currents.

809,997. METAL-TURNING APPARATUS. RICHARD H. STEVENS, Rumhall, Pa. Filed June 19, 1905. Serial No. 266,667.



Claim.—1. In a turn-up mechanism, a tilting arm having a movable bar or slide therein, and connections for withdrawing said bar; substantially as described.

2. In a turn-up device, a tilting arm having a hole or guide therein, a transverse bar in said hole, and means for automatically withdrawing the bar when the weight of the beam is removed from it; substantially as described.

3. In a turn-up device, a tilting arm, a transverse sliding bar therein, and mechanism for automatically withdrawing the bar when the arm is in vertical position; substantially as described.

4. In a turn-up device, a tilting arm having a hole or guide therein, a transverse bar in said hole, and a weight for automatically withdrawing the bar when the weight of the beam is removed from it; substantially as described.

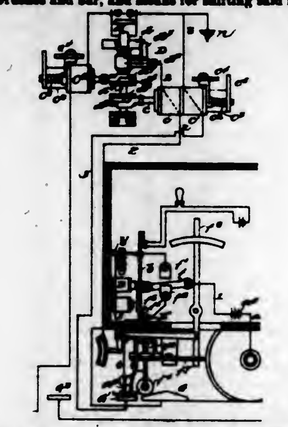
809,998. MANUFACTURE OF ARTIFICIAL FUEL. AUGUST STILLEMEN, New York, N. Y. Filed Feb. 21, 1905. Serial No. 246,805.

Claim.—1. The herein-described process of producing solid petroleum for fuel which consists in mingling, approximately, seventy-five parts by weight of petroleum, sixteen parts by weight of turpentine, two parts by weight of sodium palmitate or sodium stearate, then adding five parts by weight of caustic soda and two parts by weight of water and heating and agitating, substantially in the manner explained.

2. As a new article of manufacture, the herein-described artificial fuel composed of, approximately, seventy-five parts by weight of petroleum, sixteen parts by weight of turpentine, two parts by weight of sodium palmitate or sodium stearate, to which has been added five parts by weight of caustic soda and two parts by weight of water, the whole agitated and heated, substantially in the manner set forth.

809,999. RAILWAY SIGNALING. SAMUEL D. STROHM, Philadelphia, Pa. Filed Aug. 29, 1891. Serial No. 404,148.

Claim.—1. An electric motor car having an electric motor, a source of electrical supply, circuit connections therefor, a shunt or branch circuit including magnetic devices, contact-brushes carried by the car, contact devices with which said brushes are adapted to coact, said devices being arranged along the line of way, station appurtenances in front of and behind said contact devices, and in circuit therewith, a sliding bar carried by the car, controlling mechanism also carried by the car and adapted to be actuated by said bar, said mechanism being controlled by said magnetic devices, a frame for said brushes and bar, and means for shifting said frame.



2. In a railway, groups of separate alining contact-plates located at predetermined points along the line of way, said plates being insulated from each other, and one of them having reversely-inclined contact-surfaces, in combination with circuit-controlling mechanisms carried by a car, and station appurtenances in circuit with said contact-plates.

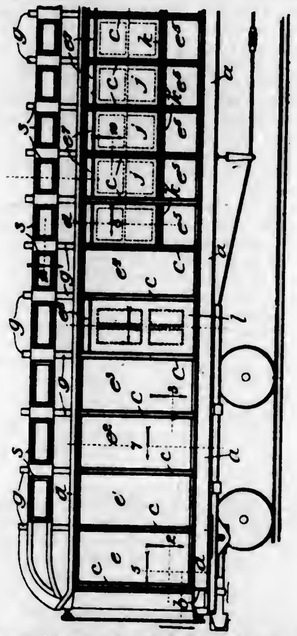
3. In a railway, the combination with a source of electrical supply, of a car or vehicle, a driving-motor thereon, electrical connections between the same and the source of supply, a hand-lever acting on a suitable controller for governing the speed or power of said motor, a suitable switch for governing the action of the motor and controllable independently of said hand-lever and irrespective of the position thereof, a mechanically-operated arm for engaging with and actuating said switch, an electromagnet for effecting the engagement between said arm and said switch, said magnet being included in the electrical connections between the source of supply and a track-contact, a contact carried by the car or vehicle and connected with said magnet, and a track-contact adapted to be engaged by said contact carried by the car.

4. In a railway, the combination with a source of electrical supply, of a car or vehicle, a driving-motor thereon, electrical connections between the same and the source of supply, a hand-lever acting on a suitable controller for governing the speed or power of said motor, an electric switch for governing the action of said motor, and controllable independently of said hand-lever and irrespective of the position thereof, a mechanically-operated arm for engaging with and actuating said switch, an electromagnet for effecting the engagement between the said arm and said switch, said magnet being included in the electrical connections between the source of supply and a track-contact, a contact carried by the car or vehicle and connected with said magnet, and means along the line of way for effecting the action of said magnet when the line of way for a predetermined distance is clear.

5. In a railway, the combination with a source of electrical supply, of a car or vehicle, a driving-motor thereon, electrical connections between the same and the source of supply, a manual device acting on a suitable controller for governing the speed or power of said motor, an electric switch for governing the circuit of said motor, a mechanically-operated arm for engaging with and operating said switch, an electromagnet for effecting the engagement between said arm and said switch, said magnet being in shunt-circuit with said controller, and means along the line of way for governing the circuit of said magnet.

810,000. RAILWAY-CAR. ALBERT W. SULLIVAN and WILLIAM RENSHAW, Chicago, Ill. Filed May 18, 1904. Serial No. 208,223.

Claim.—1. In a car of the class described, the combination of a supporting-framework comprising side sills formed of flanged metal beams, upper "plates" formed of flanged metal beams, and standards formed of metal channel-beams having solid end blocks welded to the web and flanges of the channel-beams to form an integral structure therewith, and means for securing the standards to the flanged beams.



2. In a car of the class described, the combination of flanged metal beams, and metal channel-beams having solid end blocks welded to the web and flanges of the channel-beams to form an integral structure therewith, and means for securing the channel-beams to the flanged beams.

3. In a car of the class described, the combination of a supporting-framework, side plate-girders therefor formed of metal I-beam side sills, metal "plates" formed of angle-beams, side posts interposed between and secured to such side sills and plates and formed of two separated channel-beams arranged back to back, and sheet-metal filler members arranged between such separated channel-beams which form the side posts and are secured to the web portions thereof diminishing in thickness from the end toward the center of the car, substantially as described.

4. In a car of the class described, the combination of a supporting-frame portion formed of metal members, a superstructure frame portion formed of metal members, an exterior sheet-metal filler secured to the metal superstructure, an interior lining, and brackets for securing said interior lining to the exterior sheet-metal filler, substantially as described.

5. In a car of the class described, the combination of a metal supporting-frame portion, a superstructure frame portion formed of metal members, an exterior sheet-metal filler secured to the superstructure frame portion, brackets secured to the exterior sheet-metal filler, and interior-finish lining secured to the brackets and strips of insulating material interposed between the interior lining and the brackets, substantially as described

6. In a car of the class described, the combination of a supporting-frame portion formed of metal members, a superstructure frame portion formed of metal members, an exterior shell secured thereto, an interior lining, brackets for securing said interior lining to the exterior shell of the metal superstructure so as to provide a uniform interior finish, a floor portion formed of metal base-plates secured to the metal supporting-frame, and an upper floor portion—such as wood and similar material—detachably secured thereto, substantially as described.

7. In a car of the class described, the combination of a metallic supporting-frame, a superstructure formed of a metal "plate" supported by a plurality of metal posts formed of channel-beams secured thereto and to the metal supporting-frame, sheet-metal fillers secured to and between each pair of channel-beam side posts so as to form an exterior shell, metal carlines secured to the upper plate and forming a skeleton roof member, a metal covering therefor, an inner-finish lining for the roof of the car, and brackets independently supporting the same upon the exterior shell of the car so as to provide an air-space between such lining and the roof structure substantially from end to end of the car, substantially as described.

8. In a car of the class described, the combination of side sills formed of metal I-beams, upper "plates" formed of metal angle-beams, side posts formed of metal box-beams having solid forged ends, rivets for securing the forged ends of the box-beams to the metal side sills and metal plates, and "carlines" secured to the upper "plates," substantially as described.

9. In a car of the class described, the combination of side sills formed of metal I-beams, upper "plates" formed of inverted metal T-beams, side posts formed of metal box-beams having solid forged ends riveted to the upper flange of the I-beam side sills and to the head of the inverted metal T-beam, "carlines" transversely arranged and forming the skeleton roof-frame riveted to the inner side of the vertical web portion formed of inverted-T beams, an exterior roof-covering A riveted to the outer portion of the vertical web formed of inverted-T beams, metal filler-plates secured to the metal side posts so as to form the exterior skin or surface of the car, brackets secured to such exterior sheet-metal filler, and interior-finished lining portions secured to the brackets, substantially as described.

10. In a car of the class described, the combination of side sills formed of metal I-beams, upper "plates" formed of metal angle-beams, side posts formed of metal box-beams having solid end blocks welded to the web and flanges of the channel-beams, and rivets for securing the forged ends of the box-beams to the metal side sills and metal plates.

11. In a car of the class described, the combination of a supporting-frame portion formed of metal members, a superstructure frame portion formed of metal members, an exterior metallic shell secured thereto, an interior lining, brackets for securing such interior lining to the exterior shell of the car, a floor portion formed of metal base-plates secured to the metal supporting-frame, an upper-floor portion detachably secured thereto, and an interposed layer of asbestos or similar lining material arranged between the metallic under-floor and the upper-floor portions, substantially as described.

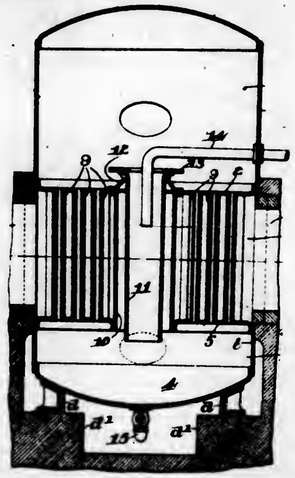
12. In a car of the class described, a corner-support comprising spaced side channel-beams arranged back to back and having solid forged ends, a similar end channel-beam having its back adjacent the side flanges of the first-mentioned channel-beam and spaced therefrom, a side filler between the side channel-beams and an end filler between the side flanges of the side channel-beams and the back of the end channel-beams, and rivets securing the parts together.

810,001. METAL BOX-BEAM. ALBERT W. SULLIVAN, St. Louis, Mo., and WILLIAM RENSHAW, Chicago, Ill. Filed Dec. 16, 1904. Serial No. 236,962.

Claim.—As a new article of manufacture, a wrought-metal channel-beam having on one or each end a head or base portion composed of a separate block, inserted between the flanges and web of the channel-beam, and with the same welded into an integral solid body, said block having its lower face in the plane of the end of the channel-beam and its outer side in the plane of the outer sides of the flanges of the beam.

810,002. VERTICAL BOILER. TOSABURO SUDZUKI, Sumatra, Japan. Filed May 17, 1905. Serial No. 260,751.

Claim.—1. A vertical boiler comprising a unitary structure provided with horizontal partition-walls forming a lower water-chamber, an upper evaporating-chamber, and an intermediate combustion-chamber, said combustion-chamber having an inlet and an outlet for the passage of products of combustion, a plurality of tubes located in the path of travel of said products of combustion and connecting said water and evaporating chambers, a circulating-tube centrally disposed within said combustion-chamber, a feed-water tube located within said circulating-tube and extending throughout the length thereof, said feed-water tube having on its upper end a flange overhanging said circulating-tube, and a feed-water pipe projecting downwardly within said feed-water tube.



2. In a vertical boiler the combination of a lower water-chamber, an upper evaporating-chamber, an intermediate combustion-chamber closed to said water and evaporating chambers, a plurality of tubes in said combustion-chamber connecting said water and evaporating chambers, a relatively enlarged circulating-tube for said combustion-chamber, a pair of deflecting-partitions extending on opposite sides of said inlet and outlet toward each other in said combustion-chamber, one of said partitions engaging said tube, the remaining partition being spaced apart permitting the products of combustion to travel in a circuitous path from said inlet to said outlet.

3. A feed-water heater for boilers of the class described comprising an outer water-tube, an inner tube inclosed by and separated from said outer tube, a feed-water pipe projecting downwardly in said inner tube, the latter having a flange overhanging the said outer tube.

4. In a vertical boiler the combination of a lower water-chamber, an upper evaporating-chamber, an intermediate combustion-chamber having horizontally-disposed ingress and egress passages causing the products of combustion to travel in a horizontal path from said ingress to egress passages.

5. In a vertical boiler the combination of a lower water-chamber, an upper evaporating-chamber, an intermediate combustion chamber having horizontally-disposed ingress and egress passages relatively restricted with respect to said combustion-chamber causing the products of combustion to travel in a substantially horizontal path from said ingress to egress passages.

6. In a vertical boiler the combination of a lower water-chamber, an upper evaporating-chamber, a plurality of tubes connecting said water and evaporating chambers, an intermediate combustion-chamber having horizontally-disposed ingress and egress passages causing the products of combustion to travel in a horizontal path from said ingress to egress passages.

7. In a vertical boiler the combination of a lower water-chamber, an upper evaporating-chamber, a plurality of tubes connecting said water and evaporating chambers, an intermediate combustion-chamber having horizontally-disposed ingress and egress passages relatively restricted with respect to the combustion-chamber causing the products of combustion to travel in a substantially horizontal path from said ingress to egress passages.

8. In a vertical boiler the combination of a lower water-cham-

ber; an upper evaporating-chamber, an intermediate combustion-chamber having an inlet and an outlet, a plurality of tubes connecting said water and evaporating chambers, deflecting-partitions extending from opposite sides of said outlet and inlet into said combustion-chamber, one of said partitions engaging a tube, the remaining partition being spaced apart causing the products of combustion to travel in a circuitous path from the inlet to the outlet.

810,008. WIRE-STRETCHER. LAFE SWANK, Anderson, Ind., assignor to Dwiggins Wire Fence Company, Anderson, Ind., a Corporation of Indiana. Filed Oct. 28, 1905. Serial No. 284,814.

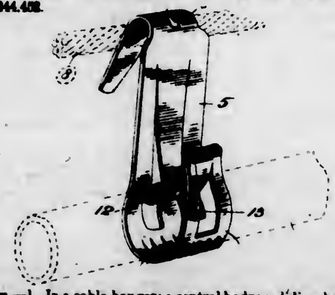
Claim.—1. A tool of the class described comprising a lever, an arm pivoted thereto, a coacting jaw also pivoted to the arm adjacent the short end of the lever, and means arranged between the adjacent ends of the lever and jaw for preventing the wire from lying closely upon the arm.

2. A tool of the class described comprising a lever, an arm pivoted thereto, a coacting jaw also pivoted to the arm adjacent the short end of the lever, means arranged between the adjacent ends of the lever and jaw for preventing the wire from lying closely upon the arm, and a finger 13 carried by the fulcrum end of the arm.

3. A tool of the class described comprising an arm having a rib on its upper face, a lever pivoted upon the upper face of said arm and provided with a recess on its under side near the short end to receive one end of said rib, and a jaw pivotally mounted on the arm and adapted to coöperate with the short end of the lever and provided with a recess on its under side adapted to receive the other end of said rib.

4. A tool of the class described comprising an arm having a rib on its upper face, a lever pivoted upon the upper face of said arm and provided with a recess on its under side near the short end to receive one end of said rib, a jaw pivotally mounted on the arm and adapted to coöperate with the short end of the lever and provided with a recess on its under side adapted to receive the other end of said rib, and a finger 13 rising from the face of the arm at its fulcrum end.

810,004. CABLE-HANGER. FRANK C. TABLER, St. Louis, Mo., assignor to Thomas R. Fowler, St. Louis, Mo. Filed Feb. 6, 1905. Serial No. 244,468.

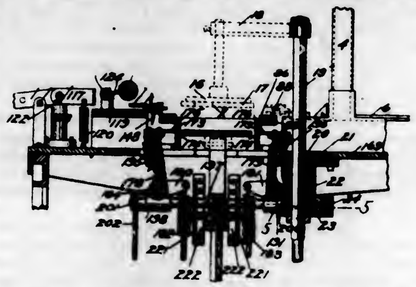


Claim.—1. In a cable-hanger: a central body; a sliding hook extending from the central body; a restricted bearing extending downwardly from the hook to engage the supporting-cable; a gripping-hook extending downwardly from the opposite end of the central body; a spring-clamp extending from the central body to press the cable downwardly into the gripping-hook, and teeth extending upwardly from the gripping-hook to engage the cable.

2. In a cable-hanger: a central body; a sliding hook extending from the central body; a gripping-hook extending downwardly from the opposite end of the central body; a spring-clamp extending from the central body to press the cable downwardly into the gripping-hook and a second spring-clamp extending from the gripping-hook in opposition to the first spring-clamp.

3. In a cable-hanger: a central body; a sliding hook extending from the central body; a gripping-hook extending from the opposite end of the central body; teeth carried by the gripping-hook and a spring-clamp in position to press the cable into the gripping-hook against the teeth.

810,005. PACKAGE-WRAPPING MACHINE. EDWARD J. TIBBETT and PHILIPP FUNCK, Rochester, N. Y., assignors to Thomas B. Dunn, Rochester, N. Y. Filed Apr. 21, 1904. Serial No. 204,295.



Claim.—1. In a package-wrapping machine, the combination of a folder; a magazine for the article to be wrapped; means for discharging articles successively therefrom; a supply of wrappers; means for transferring the wrappers successively to the folder; a vertical shaft; a carrier supported horizontally upon said vertical shaft for taking articles discharged from the magazine and delivering them successively to the folder; means for swinging the carrier circularly around the axis of its shaft in a path between the magazine and the folder; means for moving said carrier in the direction of the axis of its said shaft to the path of the carrier at one end of its path, whereby the carrier is caused to pick up the article, and at the other end, whereby the carrier is made to deposit it within the folder; and means for releasing the article from the carrier when delivered to the folder.

2. In a package-wrapping machine, the combination of the folder; a magazine for the articles to be wrapped; means for discharging articles successively therefrom; a supply of wrappers; means for transferring the wrappers successively to the folder; a vertical shaft; a carrier supported horizontally upon said vertical shaft, for taking articles discharged from the magazine and delivering them successively to the folder; means for swinging the carrier upon its vertical shaft in a path between the magazine and the folder; a spring for moving said carrier in the direction of the axis of said shaft at one end of its path, whereby the carrier is caused to pick up the article, and also at the other end of its path, whereby the carrier is made to deposit said article within the folder; and means for releasing the article from the carrier when delivered to the folder.

3. In a package-wrapping machine, the combination of a folder; a magazine for the articles to be wrapped; means for discharging the articles successively therefrom; a supply of wrappers; means for transferring the wrappers successively to the folder; an oscillating carrier supported horizontally upon a vertical shaft, to take articles discharged from the magazine and deliver them successively to the folder; a spring to swing said carrier horizontally around its vertical shaft from the magazine to the folder; a spring to pull it down upon the article discharged from the magazine, and to pull it down to the folder; rotary cams; connections between the cams and the carriers; whereby the latter is both returned to the magazine, and elevated after each descent.

4. In a package-wrapping machine, the combination of a folder; a magazine for the articles to be wrapped; means for discharging the articles successively therefrom; a supply of wrappers; means for transferring the wrappers successively to the folder; an oscillating carrier to take articles discharged from the magazine and deliver them successively to the folder; a spring to pull said carrier down upon the article discharged from the magazine, and to pull said carrier down to the folder, after it has been swung thereto; a spring to swing it from the magazine to the folder; a pinion on the shaft of said carrier; a reciprocating rack, whereby said carrier is oscillated; rotary cams; connections between said cams and the shaft of said carrier, and said rack, respectively, whereby said carrier is, respectively, elevated after each descent, and swung from the folder to the magazine.

5. In a package-wrapping machine, the combination of a folder; a magazine for the articles to be wrapped; means for discharging the articles successively therefrom; a magazine for wrappers; a spring-actuated reciprocating frame adapted to convey a wrapper to the folder; spring-actuated plates upon said frame to engage a wrapper at its corners; positive means for returning the frame; means for transferring the wrappers one at a time from their magazine to the reciprocating frame; a carrier for taking the articles from their magazine and delivering them successively above the wrapper as it lies above the folder; means for forcing the article and the wrapper down through said frame into the folder in proper relative positions for wrapping.

6. In a package-wrapping machine, the combination of a folder; a magazine for the articles to be wrapped; means for discharging the articles successively therefrom; a magazine for wrappers; a reciprocating frame adapted to receive a wrapper and to convey it to the folder; means for transferring the wrappers successively from their magazine to the reciprocating frame; a spring adapted to move the frame from the wrapper-magazine to the folder; an oscillating carrier horizontally supported upon a vertical shaft and adapted to take articles discharged from the magazine and deliver them successively to the folder; a spring adapted both to pull said carrier down upon the article discharged from the magazine at one end of its path, and to pull it into said folder at the other end of its path; a spring adapted to swing said carrier upon its vertical shaft from the magazine to the folder; a driven shaft; cams upon said shaft; connections between said cams and the reciprocating frame and carrier, respectively, whereby said parts are returned to their respective initial positions after each action of said springs, said cams being so placed upon said shaft as to cause said operations to take place in proper sequence.

7. In a package-wrapping machine, the combination of a folder; a magazine for the article to be wrapped; means for discharging articles successively therefrom; a supply of wrappers; means for transferring such wrappers successively to the folder; a vertical shaft; a carrier for taking successively the articles to be discharged from the magazine, and placing them upon wrappers, means for moving the carrier circularly around the axis of its shaft in a path between the magazine and the folder; means for moving said carrier in the direction of the axis of said shaft at one end of its path, to pick up the article, and at the other end of its path, both to deposit the article within the folder, and to force the wrapper into the folder with the article; and means for releasing the article from the carrier when delivered to the folder.

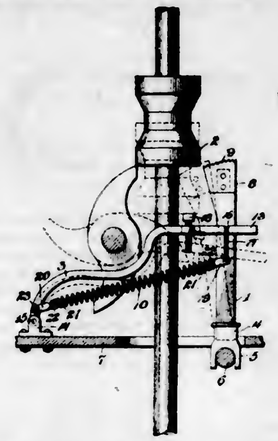
8. In a package-wrapping machine, the combination of a folder; a magazine for the articles to be wrapped; means for discharging articles successively therefrom; a magazine for cut outer wrappers; a reciprocating frame adapted to receive the wrappers one at a time and to convey them to the folder; means for transferring the wrappers from their magazine to the reciprocating frame; means for supporting a roll of inner wrapping material; means for severing wrappers of proper length therefrom; means for transferring the inner wrapper successively, when severed, to the folder, above the outer wrappers, respectively, a carrier to take the articles discharged from the magazine, to swing horizontally to the folder, and to descend with the articles into the folder, thereby forcing down into the folder beneath the article both inner and outer wrappers in proper relative position for folding and means for operating said carrier.

9. In a package-wrapping machine, the combination of a folding-box; means for depositing an article and wrapper therein; a vertical reciprocating platen adapted to form the floor of a folding-box during the operation of wrapping; means for wrapping the wrapper around the article; a spring adapted to lower the platen with a package upon it from the folding-box after the article has been wrapped; means for removing the package from the platen when the latter has been lowered away from the folding-box; a rotary cam; and connections between the cam and the platen, whereby the platen is held up against the folding-box during the operation of folding, and is returned to the folding-box against the resistance of the spring, after the package has been removed from it.

810,006. AUTOMATIC SAFETY ATTACHMENT FOR STAMP-MILLS. JAMES C. H. VAUGHT, Lead, S. D. Filed Mar. 20, 1904. Serial No. 199,525.

Claim.—1. The combination with a tappet, and a cam for actuating the same, of a safety attachment for stamp-mills, comprising a tappet-support normally arranged beyond the path of the tappet, and means located beneath the cam-actuated tappet and arranged to be directly operated by the tappet for moving the said support into the path of the said tappet, whereby the latter will be supported out of operation.

2. The combination with a tappet, and a cam for actuating the tappet, of a tappet-support normally arranged out of the path of the tappet, and means located beneath the cam-actuated tappet and arranged to be directly engaged by the said tappet for carrying the support into the path of the same, whereby the tappet will be supported in an elevated position beyond the cam.



3. The combination with a tappet, and a cam for actuating the same, of a safety attachment for stamp-mills, comprising a tappet-support, a tripping device located beneath the said tappet and holding the tappet-support normally out of the path of the tappet and arranged to be directly engaged by the tappet, whereby the support will be released, and means for automatically moving the support into the path of the tappet, when the said support is released.

4. The combination with a tappet, and a cam for actuating the same, of a safety attachment for stamp-mills, comprising a spring-actuated support, and a tripping device located below and normally holding the support out of the path of the tappet and operable by direct engagement with the tappet for releasing the support, said support being extended above the tripping device.

5. The combination with a tappet, and a cam for actuating the same, of a safety attachment for stamp-mills, comprising an automatically-movable tappet-support, a tripping device located beneath and normally holding the tappet-support out of the path of a tappet, and an adjustable device carried by the tripping device and arranged to be directly engaged and operated by the tappet.

6. A safety attachment for stamp-mills, comprising a tappet-support, a pivotally-mounted tripping device detachably engaging the support for holding the same normally out of the path of the tappet, said tripping device being arranged to be directly engaged and operated by the tappet, and a spring for maintaining the support in engagement with the tripping device and for moving the support into the path of the tappet when the said support is tripped, said support being extended above the tripping device.

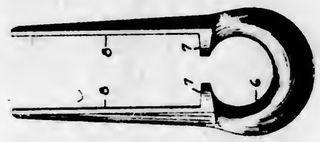
7. A safety attachment for stamp-mills, comprising a tappet-support having a combined guide and keeper, a tripping device operating within the combined guide and keeper and provided with means for engaging the same, and a spring for maintaining the keeper in engagement with the tripping device and for actuating the supporting device when the same is tripped.

8. A safety attachment for stamp-mills, comprising a tappet-support having a combined guide and keeper, a tripping device consisting of a pivoted bar or member extending into the combined guide and keeper and provided with means for engaging the same, and a spring connected with the combined guide and keeper and with the tripping device.

9. The combination with a tappet, and a cam for actuating the same, of a safety attachment for stamp-mills, comprising an upright automatically-movable oscillatory tappet-supporting finger, and means located beneath the cam-actuated tappet for setting and tripping the finger, said means being arranged to be directly engaged and operated by the tappet.

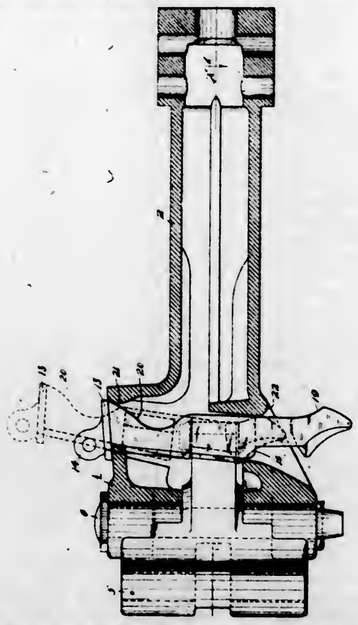
10. A safety attachment for stamp-mills, comprising an upright oscillatory tappet-supporting finger provided at its upper end with a cap having an inclined corrugated face which extends upward and outward from the tappet when in engagement with the same, means for actuating the finger, and a tripping device arranged to be directly engaged and operated by the tappet.

810,007. METHOD OF MAKING CLEVIS-IRONS. WILLIAM S. WARD, Plantsville, Conn., assignor to The H. D. Smith & Company, Plantsville, Conn., a Corporation. Filed June 10, 1905. Serial No. 264,743.



Claim.—The herein-described method of producing clevis-irons which consists in striking up a blank from a bar of iron by drop-forging in dies, with the blades and eye all substantially in one plane, then trimming off the fin or surplus metal and finally twisting the iron of the eye portion at its smaller diameter to bring the blades into their proper position.

810,008. CAR-COUPLING. EDWIN C. WASHBURN, Minneapolis, Minn. Filed Nov. 21, 1904. Serial No. 233,565.



Claim.—1. A coupler having a draft-bar, knuckle and lock-dog, with said dog arranged to lift and set on the tail of said knuckle for automatic unlocking, and the tail of said knuckle being cut away or formed with a cam on its rear, operating to force said lock-dog into alinement with its seat under the closing movement of the knuckle, substantially as described.

2. A coupler having a draft-bar, knuckle and lock-dog, said dog being arranged to set on the tail of said knuckle, for automatic uncoupling, and having a vertical shouldered surface, and said knuckle having a vertical cam-surface acting on the vertical shouldered surface of said dog, to force said dog back under the closing movement of said knuckle, substantially as described.

3. A car-coupler having the pivoted knuckle, and a lock-dog, the tail of said knuckle having a vertical cam-surface 9, and said lock-dog having an under shoulder 15 and an upper shoulder 16, said shoulder 15 being engageable with the tail of the knuckle to set the dog for uncoupling, and said cam-surface 9 operating on said dog between said shoulders 15 and 16, to force said dog back and drop said shoulder 16 onto the tail of said knuckle under the closing movement of the knuckle, substantially as described.

4. A coupler having a hollow guard-arm formed with a Y-shaped binder-reinforcing web adapted to carry the tension strain on the guard-arm to the head of the coupler, substantially as described.

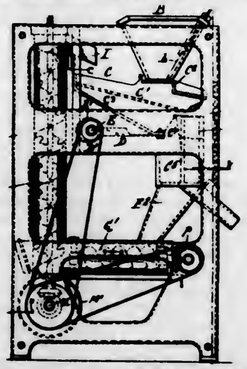
5. A coupler having a draft-bar, pivoted knuckle, and vertical-moving lock-dog, said dog being arranged to be set on the tail of said knuckle for automatic uncoupling, and being cut away at its back so as to unlock when the coupler is pulled out beyond its normal limit, substantially as described.

6. In a car-coupler, a combination with a coupler-head, of a pivoted knuckle and a coöperating vertical movable lock-dog, said dog having a shoulder adapted to rest upon the tail of the knuckle when the said dog is raised and swung forward, a coöperating cam-surface on the dependent tail of said dog, and on said coupler-head arranged to be engaged and to force said dog forward when the shoulder of said dog is raised for engagement with the tail of the knuckle, substantially as described.

7. A coupler having a knuckle and a vertically-movable lock-dog, which dog is cut away at its back so that the dog will lift into an unlocking position when the coupler-head is torn loose and is arranged to be set on the tail of the knuckle by a forward and upward swinging movement, for automatic uncoupling, and having a cam projection that coöperates with a cam-surface on the tail of said knuckle, to force said knuckle open when said dog is raised above its unlocking position, substantially as described.

8. A coupler having a knuckle and a vertically-movable lock-dog, which dog is cut away at its back so that the dog will lift into an unlocking position when the coupler-head is torn loose and is arranged to be set on the tail of the knuckle by a forward and upward swinging movement, for automatic uncoupling, having a cam projection that coöperates with a cam-surface on the tail of said knuckle, to force said knuckle open when said dog is raised above its unlocking position, said dog at all times being held against movements transversely of the coupler-head, substantially as described.

810,009. BEAN CLEANING AND POLISHING MACHINE. ERNEST E. WERP, Oxford, Mich. Filed Sept. 30, 1904. Serial No. 226,615.



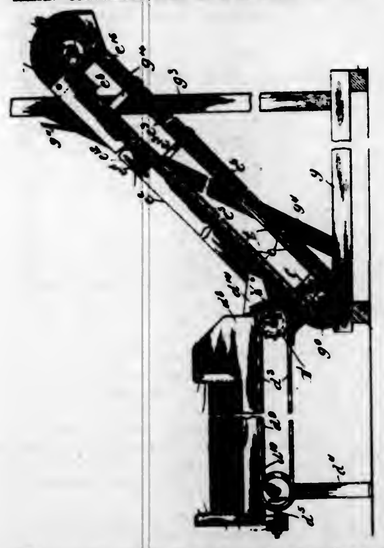
Claim.—1. In a bean cleaning and polishing machine, a hopper, a spiral conveyor suitably inclosed, suitable chutes for delivering beans from the hopper into the conveyer, a screen for receiving and separating the beans from the polishing agent when discharged by the conveyer, a chute for receiving the beans and returning them to the conveyer for a second passage through the polishing agent, and means for receiving the polishing agent when separated from the beans by the screen and returning it to the spiral conveyer, substantially as described.

2. In a bean cleaning and polishing machine, a multiple-feed hopper, a plurality of horizontal conveyers, a corresponding number of vertical conveyers suitably inclosed, means for delivering beans from the feed-hopper to the horizontal conveyers, a screen to separate the beans from the polishing agent as they are discharged by the vertical conveyer, suitable chutes to discharge the beans from the machine when separated from the polishing agent, and chutes to return the polishing agent back to the conveyers, substantially as described.

3. In a bean cleaning and polishing machine, a multiple-feed hopper, a plurality of horizontal conveyers, a corresponding number of vertical conveyers, means for delivering the beans from the feed-hopper to the horizontal conveyer, a screen for receiving and separating the beans discharged from the vertical conveyer, a chute to receive the beans discharged by the screen, means for returning them to the horizontal conveyer for a second passage through the polishing agent, and means for returning the polishing agent to the conveyers, substantially as described.

4. In a bean cleaning and polishing machine, a multiple-feed hopper, a plurality of horizontal conveyers, a corresponding number of vertical conveyers suitably inclosed, means for delivering the beans from the hopper to the horizontal conveyers, means for separating the beans from the polishing agent as they are discharged by the vertical conveyer, suitable chutes to discharge the beans from the machine when separated from the polishing agent, and means for discharging the polishing agent from the machine, substantially as described.

810,010. PORTABLE GRAIN ELEVATOR AND CONVEYER. GUSTAVE WERNELMANN and EDWARD H. OVERHOLT, Streator, Ill., assignors to The Wernelmann Manufacturing Company, a Corporation of Illinois. Filed June 24, 1903. Serial No. 162,866.



Claim.—1. The combination with a supporting-frame, of supporting-wheels, a main driving-shaft journaled on the frame on a chain elevator pivoted at one end thereon, means for adjusting the free end of the elevator to a desired height, a shaft journaled on the lower end of the elevator, a receiving-chain conveyer pivoted on the shaft and positioned to turn upwardly into the elevator, legs pivoted at the outer end of the receiving-conveyer and on which one of the shafts for the conveyer is journaled, means for adjusting the tension of the conveyer-chain comprising bolts acting to swing said legs on their pivots.

2. The combination with a supporting-frame, of wheels beneath the same, a main driving sprocket-shaft journaled transversely at one end of the frame, metallic elevator-trough pivoted at one end thereon, endless chains provided with transverse lugs and passing around the sprocket-wheels on said driving-shaft, and similar sprockets at the outer end of the conveyer-troughs, a sprocket-shaft journaled transversely on the lower end of the elevator, a receiving-conveyer pivoted thereon in position to turn upwardly into the elevator, said conveyer comprising a sheet-metal box open at the top and the end adjacent to the elevator, legs at the outer end of the same, a sheet-metal hopper hinged in one side of said conveyer and provided with flanged ends acting to engage the side walls thereof when turned outwardly, a conveyer-chain having transverse lugs thereon driven from the sprocket-wheels on said shafts and means for tightening the conveyer-chain operated by movement of the legs thereof on their pivots.

3. In a device of the class described the combination with a wheeled frame, an elevator pivoted thereto at one end and comprising conveyer-troughs having integral sheet-metal bottom and side walls bent to form trough-sections and rigidly bolted together with the butts directed upwardly in the upper and downwardly in the lower trough, a strap of metal connecting corresponding side walls of the upper and lower troughs at the joints, washers countersunk on the inner sides engaging the outer sheet at the joints and conical headed bolts engaging through the top and acting to draw the sheet inwardly thereby countersinking the bolt-head therein,

4. The combination with upper and lower conveyer-troughs of sheet metal having integral bottom and side walls, of a sprocket-shaft at each end and between the troughs, endless chains secured over the sprockets thereon and connected by transverse lugs and a rigid extension on the bottom of the upper trough filling the space between the chains above and below and bearing on the upper shaft and acting to prevent material clogging the elevator.

5. The combination in an elevator of two sheet-metal troughs built of sectional lengths secured together at the ends, sprocket-shafts journaled at the ends and between the troughs, endless transversely-connected elevator-chains extending around said sprockets, an adjustable guide at the upper end of said trough, said troughs each comprising a solid shell of metal joined with the butts directed with the travel of the chain, a receiving-conveyer comprising a sheet-metal box open at the top and one end and pivoted on the lower end of the elevator and conveyer chains movable therein and acting to deliver the contents into the elevator.

6. The combination with an elevator of the class described, of a receiving-conveyer pivoted on the lower end thereof and adapted to be turned upwardly into the elevator and comprising a box open at the top and at the end adjacent the elevator, legs at the outer end of the conveyer, a hinged outwardly-swinging side on the box forming a hopper, an endless conveyer-chain movable along the bottom of the box, means for tightening the conveyer-chain operated by movement of the conveyer-legs, and chute-boards also pivoted on the elevator and extending up on the sides of the receiving-conveyer and acting to direct material into the elevator.

7. In a chain elevator the combination with a sheet-metal trough comprising a plurality of trough-sections each having integral bottom and side walls and having the transverse lap of the sections directed with the travel of the chain, of sprocket-shafts journaled at the top and bottom thereof, sprocket-chains operated thereby, a metallic fitting engaged on the shaft and forming a continuation of the bottom of the trough, a hood at the upper end of the elevator, parallel guide-slides on each side of the same extending parallel with the troughs, a sliding block between said guide-slides and in which the shaft is journaled, bolts secured on said blocks, a transverse bar at the outer end of the hood through which the bolts extend and nuts engaged on said bolts and acting to move the shafts longitudinally of the troughs and tighten the chain.

8. In a chain elevator the combination with a sheet-metal trough comprising a plurality of trough-sections each having integral bottom and side walls and having the transverse lap of the sections directed with the travel of the chain, of sprocket-shafts journaled at the top and bottom thereof, sprocket-chains operated thereby, a metallic fitting engaged on the shaft and forming a continuation of the bottom of the trough and shaped to support the chain to and from the sprocket-wheels and acting to prevent kinking thereof, a hood at the upper end of the elevator, parallel guide-slides on each side of the same extending parallel with the troughs, a sliding block between said guide-slides and in which the shaft is journaled, bolts secured on said blocks, a transverse bar at the outer end of the hood through which the bolts extend and nuts engaged on said bolts and acting to move the shafts longitudinally of the troughs and tighten the chain.

9. The combination in an elevator, of sprocket-chains, parallel sheet-metal troughs therefor comprising sections having integral bottom and side walls and having the laps directed oppositely in the respective troughs and with the travel of the chain thereon, a sprocket-shaft at one end of the conveyor on which the same is pivotally supported, a hood at the opposite end of the trough, a sprocket-shaft adjustably journaled therein and over which the chain is trained, means for adjusting the tension of said chain by movement of the upper sprocket-shaft and a fitting forming a continuation of the bottom of the upper trough and secured on the sprocket-shaft between the laps of the chains and serving to direct the chain around the sprockets without kinking.

10. The combination with a sheet-metal receiving-conveyor, of a hinged side flanged at the ends forming a hopper, a driving-shaft on which said conveyor is pivoted, sprocket-wheels thereon, legs at the outer ends of the conveyor, a sprocket-shaft journaled thereon, endless, transversely-connected chains trained over said sprocket-

wheels with the upper run thereof movable over the bottom of the conveyor and means operated by adjustment of the legs of the conveyor for tightening the chains.

11. The combination with a sheet-metal receiving-conveyer, of a side thereon adapted to turn outwardly and forming a hopper, a sheet-metal elevator pivotally connected with said conveyer, a driving-shaft on which the elevator is pivoted at the end adjacent to said conveyer, sprocket-wheels on said shaft, a sprocket-shaft at the upper end of the elevator, endless, transversely-connected elevator-chains passing around the sprocket-wheels on the driving-shaft and the upper sprocket-shaft and a guide at each end of the conveyer provided with a rounded end and affording a continuation of the bottom.

12. The combination with a sheet-metal receiving-conveyer, of a side thereon adapted to turn outwardly and forming a hopper, a sheet-metal elevator adjustably engaged thereon, pivotally-supported means on said elevator adapted to direct material thereinto a driving-shaft on which the elevator is pivoted, sprocket-wheels on said shaft, a sprocket-shaft at the upper end of the elevator, endless, transversely-connected elevator-chains passing around the sprocket-wheels on the driving-shaft and the upper sprocket-shaft, a guide rigidly secured at the lower end of said elevator and a movable guide at the upper end, said guides being provided with rounded outer ends.

13. In a device of the class described the combination with a receiving-conveyer, of a chain elevator adjustably connected therewith, a double trough adapted to carry said chain, means for adjusting said chain, a guide rigidly secured at the lower end of said elevator and a movable guide at the upper end thereof projecting from beneath the upper trough and provided with a downwardly-turned outer end.

14. In a device of the class described the combination with a receiving-conveyer, of a double trough adjustably engaged thereon, a sprocket-shaft journaled at each end of said trough, an endless-chain conveyer carried on said sprockets, a transverse guide slidably engaged beneath the upper trough and having a rounded end adapted to direct material thereover and a downwardly-opening hood at the upper end of said trough.

15. In a device of the class described the combination with a receiving-conveyer positioned for a wagon-box to dump its contents directly thereinto, of an elevator positioned to receive the material therefrom, a sprocket-shaft at the top of the elevator, extensible adjusting-rods supported on each end thereof, a sprocket-shaft journaled at the lower ends of said adjusting-rods and driving-chains trained over the sprockets on said shafts and tightened by the extension of the adjusting-rods.

16. In a device of the class described an upper and a lower elevator-trough each comprising a plurality of overlapping sections having integral bottom and side walls, countersunk washers in suitable apertures in the overlapping ends of said sections, bolts provided with conical heads adapted to seat in said washers flush with the upper surface of said troughs and straps connecting corresponding sections of said troughs at the joints.

17. In a device of the class described the combination with upper and lower connected conveyer-troughs each comprising a plurality of overlapping sheet-metal sections, of countersunk washers seated in the overlapping ends of said sections, bolts securing said sections together and provided with conical heads adapted to seat in said washers flush with the upper surface of the troughs and a conveyer adapted to travel in said troughs.

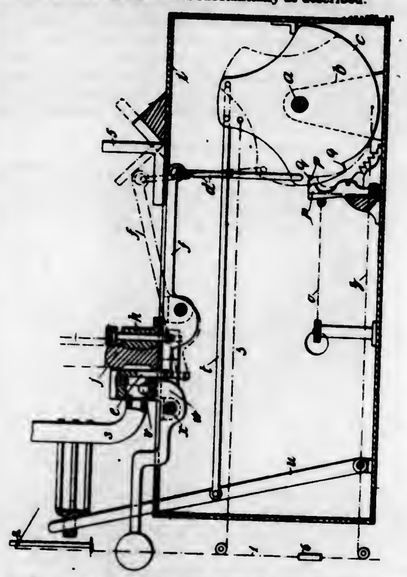
810,011. RAILWAY SIGNALING APPARATUS. JESSE WHEATLEY, East Molesey, England. Filed May 15, 1905. Serial No. 260,675.

Claim.—1. A railway signaling apparatus characterized by a "line-clear" pedal, a "danger-pedal," a striking arm or lever and a pedal-rail connected up to said pedals and operated by the flange of a wheel substantially as described.

2. A railway signaling apparatus characterized by a "line-clear" pedal, a "danger-pedal," weighted levers connected to said pedals, means for locking said weighted levers and a pedal-rail connected to said locking means and operated by the flange of a wheel substantially as described.

3. A railway signaling apparatus characterized by a "line-clear" pedal, a "danger-pedal," weighted levers connected to said pedals, means for locking and unlocking said weighted levers, means for partly disconnecting the apparatus from the semaphore and a pedal-rail connected to said locking and unlocking means and operated by the flange of a wheel substantially as described.

4. In a railway signaling apparatus of the kind set forth a device for partly disconnecting the apparatus from the semaphore with reference to Figs. 4 and 5 of the accompanying drawings consisting of a box or casing, upper and lower grooves to said casing, rods controlled by weights sliding in said casing, the upper rod being cranked and provided with a nose to engage the end of the lower rod so as to draw back the same, and means such as inclines on said casing to effect the release of the lower rod substantially as described.



5. In a railway signaling apparatus the combination with the danger-pedal, striking-arm and anvil and pedal-rail of a band of detonators and means for effecting the positive feed of said band to said anvil substantially as described.

6. In a railway signaling apparatus the combination with the danger-pedal, striking-arm and anvil and pedal-rail of a band of detonators and means for effecting the positive feed of said band to said anvil and means for preventing the premature explosion of a succeeding detonator substantially as described.

7. In a railway signaling apparatus the combination with the danger-pedal, striking-arm and pedal-rail of a pivotal anvil, a band of detonators to cross said anvil and means for effecting the positive feed of said band to said anvil or to withdraw said detonators from off the anvil to give "line clear" substantially as described.

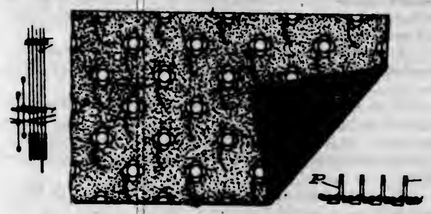
810,012. WOVEN PILE FABRIC. MATTHEW J. WHITTALL, Worcester, Mass. Filed June 26, 1902. Serial No. 113,260.

Claim.—1. As an article of manufacture, a single-ply pile fabric having its filling-threads all in a single weft plane and having a number of figuring-warps, each of which, after having been called, is carried through to the back of the fabric and there shown separate from the other figuring-warps before it is again associated therewith.

2. As an article of manufacture, a single-ply two-shot pile fabric having all its filling-threads in a single weft plane and having a number of figuring-warps, the unselected ones of which pass alternately under and over successive filling-threads, while each figuring-warp, after having been called, is carried through to the back of the fabric and there shown separate from the rest of the figuring-warps before being associated therewith.

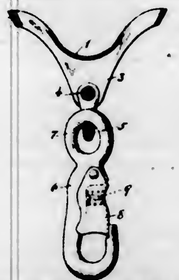
810,013. WOVEN PILE FABRIC. MATTHEW J. WHITTALL, Worcester, Mass. Filed June 26, 1902. Serial No. 113,262.

Claim.—1. As an article of manufacture, a single-ply three-shot pile fabric, having its weft-threads arranged in a single plane and having a number of figuring-warps, each of which, after having been called, is carried through the back of the fabric and there shown separate from the other figuring-warps before being again associated therewith.



2. As an article of manufacture, a single-ply three-shot pile fabric, having its filling-threads arranged in a single plane and having a number of figuring-warps, the unselected ones of which pass alternately under two filling-threads and then over one filling-thread, while each figuring-warp, after having been called, is carried through to the back of the fabric and there shown separate from the rest of the figuring-warps before being again associated therewith.

810,014. BREAST-STRAP SLIDE. BERNHOE M. WIESTHAN, New Britain, Conn., assignor to North & Judd Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Sept. 27, 1905. Serial No. 280,294.



Claim.—1. A breast-strap slide comprising a body portion having depending ears, a pivot-shaft secured in said ears, a U-shaped yoke pivotally mounted on said shaft, and a fastener having a solid eye loosely hung from said yoke so as to swing freely back and forth and from side to side.

2. A breast-strap slide comprising a body member for the attachment of the strap and having depending ears, a U-shaped yoke having its arms pivotally supported from said ears, and a fastener loosely hung on said yoke by a solid eye with an opening larger than the end of one arm of the yoke member to permit its assembling and operation, substantially as described.

810,015. ICE-BOX. PAUL H. WOLFRAM, Chicago, Ill. Filed July 23, 1904. Serial No. 217,092.

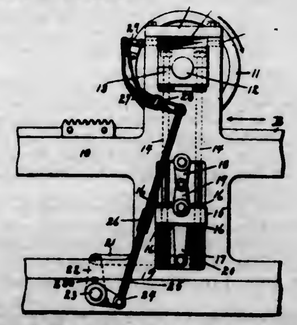
Claim.—1. In an ice-box of the kind described, the combination comprising a main body composed of the walls A, frame B and roof F; an ice-chest G supported on said frame B near the roof F for the storage of ice, said ice-chest having closed sides g' and end g^2 and open-work front and bottom g^3; a vestibule C formed by the wall A and partitions c' and c^2 and provided with an outside door D and inside door D' connecting the vestibule with the main chamber E; the top of said vestibule being open near the roof F and adapted to cause the air entering through the outside doorway to pass upward to the roof F and into said ice-chest, and from there into the main chamber E; a main chamber E inclosed by the walls A and beneath the ice-chest G, said chamber being provided with front doors O and a shelf P, having an end partition P'; rails Q adapted to support meat-hooks R; a curtain-partition T supported on the frame B and extending from the wall A on the one side and over the partition P' on the other from the side g' of the ice-chest G down over the rails Q and shelf P, thereby forming a small inclosure in the chamber E, said inclosure being open at the top and adapted to cause the air entering through the open doors O to pass into the ice-chest G; and a deflector E' suitably supported on the frame B and vestibule C, and extending across the chamber E adapted to receive and deflect part of the air passing downward from the ice-chest G and thereby causing a circulation of air in said chamber; and a plurality of apertures U provided with flaps V, said apertures and flaps being adapted to allow a change of air to take place in said chamber E through the opening and closing of the doors D and O in said ice-box, substantially as described and for the purposes specified.

2. In an ice-box of the kind described, the combination comprising a main body; an ice-chest G suitably arranged near the roof F; a vestibule C arranged within said main body and opening near the roof and over said ice-chest, and having suitable entrances D and D'; a main chamber E arranged to be entered from said vestibule and having front doors O and a shelf P; a movable partition T within said chamber E and inclosing the shelf P and doors O, and adapted to cause the air entering said doors to pass through the ice-chest G before entering the chamber E, and a deflector E' adapted to cause the circulation of the air passing from the ice-chest into the chamber E, substantially as described and for the purposes specified.

3. In an ice-box of the kind described, the combination of a main body A and B; a vestibule C and main chamber E, said vestibule forming the main entrance into said chamber; a front door O opening into said chamber; a shelf P and movable partition T in the interior of the chamber E forming a small inclosure bounded by the partition T, shelf P and front wall and door O, said inclosure being open at the top; and an ice-chest into which said vestibule and said small inclosure open, substantially as described and for the purposes specified.

4. In an ice-box of the kind described, the combination of a main body A and B, a vestibule C and main chamber E separated from said vestibule by a partition c^2, with a deflector E', said deflector being attached to said partition and supported thereby and extending from the front to the rear walls of said main chamber, and projecting outward from said partition in a curved form, substantially as described and for the purposes specified.

810,016. IMPRESSION MECHANISM OF CYLINDER PRINTING-MACHINES. HENRY A. W. WOOD, New York, N. Y., assignor to Campbell Printing Press & Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Mar. 8, 1897. Renewed Apr. 24, 1905. Serial No. 257,094.



Claim.—1. The combination in a printing-press of the framing, vertically-movable beams mounted thereon, an impression-cylinder

journaled in said boxes, means for raising and lowering said boxes,

7. The combination in an artificial belt with [illegible]

journaled in said boxes, means for raising and lowering said boxes, and a locking mechanism for locking the top sections of the boxes to the framing so as to resist the thrust of impression.

2. The combination in a printing-press of the framing, vertically-moving boxes or frames mounted therein, covers or caps arranged above said boxes, an impression-cylinder journaled in said boxes, means for raising and lowering said boxes, and a locking mechanism interposed between said boxes and said covers or caps for locking the boxes in their lowest position.

3. The combination in a printing-press of the framing, vertically-moving boxes or frames mounted therein, covers or caps arranged above said boxes, an impression-cylinder journaled in said boxes, means for raising and lowering said boxes, sliding wedges interposed between said boxes and caps, and means for actuating said wedges to lock the boxes in their lowest positions.

4. The combination in a printing-press of the framing, vertically-moving boxes mounted in the framing, caps arranged above said boxes, an impression-cylinder journaled in said boxes, means for raising and lowering said boxes, sliding wedges arranged between said boxes and said caps, and means connected to the raising and lowering mechanism for actuating said wedges to lock the boxes in their lowest positions.

5. The combination in a printing-press of the framing, vertically-moving boxes arranged therein, a shaft journaled in said boxes carrying the impression-cylinder, caps arranged above said boxes, sliding wedges arranged between said boxes and said caps, a toggle mechanism for raising and lowering said boxes, mechanism for actuating the toggle mechanism, and connections therefrom to actuate said wedges to lock the boxes in their lowest positions.

6. The combination in a printing-press of the framing, vertically-moving boxes mounted therein, a shaft carrying the impression-cylinder journaled in said boxes, sliding wedges arranged between said boxes and said caps, rods extending from said boxes and connecting to a yoke, toggles arranged between said yoke and the framing, an oscillating shaft connecting by levers, and links to operate said toggles, and levers mounted on said oscillating shaft connecting by links to levers connected to said sliding wedges to move said wedges to lock the boxes in their lowest positions.

7. The combination in a printing-press of the framing, vertically-moving boxes mounted therein, a shaft carrying the impression-cylinder journaled in said boxes, sliding wedges arranged between said boxes and said caps, rods extending from said boxes and connecting to a yoke, toggles arranged between said yoke and the framing, an oscillating shaft connecting by levers, and links to operate said toggles, and levers mounted on said oscillating shaft connecting by adjustable links to levers connected to said sliding wedges to move said wedges to lock the boxes in their lowest positions.

810,017. ARTIFICIAL BAIT. JASPER L. ACKERMAN, Monticello, Ind. Filed Apr. 19, 1905. Serial No. 256,302.

Claim.—1. An artificial bait comprising the body-sections adapted to fit together at their inner sides, an intermediate device extending longitudinally between said sections and beyond the ends thereof, cup-like clamps on said extensions for engaging the ends of the body-sections, and holding the same together, and spinners on such extensions beyond said cup-like clamps substantially as set forth.

2. An artificial bait comprising the detachable body-sections, an intermediate device extending between the same, and means in connection with said intermediate device for securing fish-hooks.

3. An artificial bait comprising a pair of detachable body-sections fitting face to face, means extending beyond the ends of said sections, and cup-like clamps on said means for holding the sections together, substantially as set forth.

4. An artificial bait comprising detachable body-sections, devices held between the same, and means in connection with said devices for securing a fish hook or hooks, substantially as described.

5. An artificial bait comprising two sections fitting face to face and means for securing the sections together, substantially as set forth.

6. The combination in an artificial bait, of the detachable sections fitting face to face, devices extending beyond the ends of the sections, spinners on said extensions, and means for detachably connecting the sections of the body, substantially as set forth.

7. The combination in an artificial bait, with body-sections detachably connected, of intermediate devices between said detachable sections and provided with means for securing a fish hook or hooks substantially as set forth.

8. An artificial bait having detachable body-sections, and a device between the same and having an inwardly-facing hook or hooks for securing a fish-hook, substantially as set forth.

9. An artificial bait comprising a body composed of detachable sections, an intermediate device between said sections and clamping devices on said intermediate device for engaging the ends of the detachable sections for holding the same together, substantially as set forth.

10. An artificial bait comprising a body composed of detachable sections, an intermediate device between said sections and extended at its ends beyond the same, spinners on such extensions and clamping devices operating in connection with said intermediate device for securing the sections of the body together.

11. An artificial bait comprising the detachable body-sections, means engaging the ends of the sections for securing the ends together, and hook-securing devices held between the sections, substantially as set forth.

12. An artificial bait comprising the detachable body-sections and means engaging the ends of the sections for securing the same together, substantially as set forth.

13. An artificial bait comprising detachable body-sections fitting face to face, and devices for securing these sections together and including means extending between the sections, substantially as set forth.

14. An artificial bait comprising the detachable body-sections and means for securing the sections together and including devices engaging with the sections at the ends thereof substantially as set forth.

15. The combination of the detachable body-sections, an extensible rod extending between the said sections and projecting beyond the ends thereof, and cup-like clamps on said rod for engaging with the ends of the body-sections, substantially as set forth.

16. The combination of the body-sections, a rod extending between the same, and rods between the body-sections and having the returned ends forming hooks for securing the fish-hooks, substantially as set forth.

17. An artificial bait comprising a body composed of detachable sections, an intermediate device between the said sections and clamping devices operating in connection with said intermediate device for securing the sections of the body together, substantially as set forth.

810,018. REPEATING ATTACHMENT FOR PHONOGRAPHS. EDWARD L. AIKEN, East Orange, N. J., assignor to New Jersey Patent Company, West Orange, N. J., a Corporation of New Jersey. Filed June 24, 1905. Serial No. 266,863.

Claim.—1. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft, and a cam rotatably mounted on said sleeve, substantially as set forth.

2. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft and a cam rotatably mounted on said sleeve on a bearing whose axis is inclined to the axis of said return-screw shaft, substantially as set forth.

3. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft and a cam rotatably mounted on said sleeve on a bearing eccentric to the axis of said return-screw shaft, substantially as set forth.

4. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft and a cam rotatably mounted on said sleeve on a bearing whose axis is inclined and eccentric to the axis of said return-screw shaft, substantially as set forth.

5. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft, a cam rotatably mounted on said sleeve, and means for holding said sleeve against rotation, substantially as set forth.

6. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and means for elevating said sound-box comprising a sleeve traveling on said return-screw shaft, a cam rotatively mounted on said sleeve on a bearing whose axis is inclined to the axis of said return-screw shaft, and means for holding said sleeve against rotation, substantially as set forth.

7. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, and a lifting-cam traveling back and forth on the return-screw, and means for operating said cam, substantially as set forth.

8. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft and a lifting-cam traveling back and forth on the return-screw, said cam being provided with means for engaging the thread of the return-screw, substantially as set forth.

9. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam, a sleeve traveling back and forth on the return-screw shaft and rotatably supporting said cam, said sleeve being apertured, and means rotatable with the cam for engaging the thread of the return-screw through said aperture, substantially as set forth.

10. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam traveling back and forth on the return-screw, and means rotating with said shaft for operating said cam at the end of its forward travel, substantially as set forth.

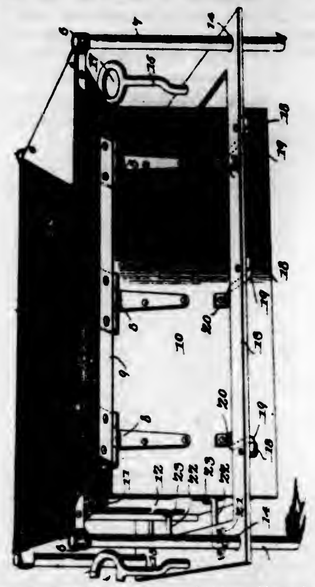
11. In a return attachment for phonographs and allied talking-machines, the combination of a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam traveling back and forth on the return-screw shaft, and means rotating with and adjustable on said shaft for operating said cam at the end of its forward travel, substantially as set forth.

12. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam traveling back and forth on the return-screw shaft and means rotating with said shaft for operating said cam at the end of its rearward travel, substantially as set forth.

13. In a return attachment for phonographs and allied talking-machines, the combination of a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam traveling back and forth on the return-screw shaft and means rotating with and adjustable on said shaft for operating said cam at the end of its rearward travel, substantially as set forth.

14. In a return attachment for phonographs and allied talking-machines, the combination with a traveling sound-box and means for progressively moving the same when in its operative position, of a return-screw shaft, a lifting-cam traveling back and forth on the return-screw shaft, and means rotating with said shaft for operating said cam, substantially as set forth.

810,019. CEMENT-BLOCK MACHINE. GORHAM J. APGAR, Robinson, Ill. Filed Feb. 13, 1905. Serial No. 245,457.



Claim.—1. A mold comprising a hopper, side and end walls pivoted thereto, and a vertically-slidable operating member for moving said walls to open and closed positions.

2. A mold comprising a hopper, side and end walls pivoted thereto, a vertically-slidable member for moving said walls to open and closed positions, and means for operating said member.

3. A mold having movable walls, an operating member surrounding said walls and adapted to move the latter to open and closed positions, and a pivotal connection between said walls and the operating member.

4. A mold having pivoted walls, a vertically-slidable member surrounding said walls and adapted to move the latter to open and closed positions, a pivotal connection between said walls and the slidable member, and means for operating said member.

5. A mold having movable side and end walls, a vertically-slidable frame surrounding said walls and spaced from the latter for moving the same to open and closed positions, and a pivotal connection between said walls and frame.

6. A mold comprising a hopper, side and end walls pivoted to the hopper, uprights for supporting said hopper, a frame mounted for vertical movement on the uprights, and a pivotal connection between said walls and frame.

7. A mold comprising a hopper, side and end walls pivoted to the hopper, uprights for supporting said hopper, a frame mounted for vertical movement on the uprights, and links pivoted to the frame and walls, respectively.

8. A mold comprising a hopper, side and end walls pivoted to the hopper, uprights for supporting said hopper, a frame mounted for vertical movement on the uprights, and handles secured to the frame for reciprocating the latter to thereby open and close said walls.

9. A mold comprising a hopper, side and end walls pivoted to the hopper, uprights for supporting said hopper, a frame mounted for vertical movement on the uprights, a pivotal connection between said walls and frame, and means for limiting the vertical movement of the latter.

10. A mold comprising a hopper provided with supporting-brackets, side and end walls pivoted to the hopper, uprights seated in said brackets, a frame surrounding the pivoted walls and pro-

vided with openings for the reception of the uprights, links pivoted

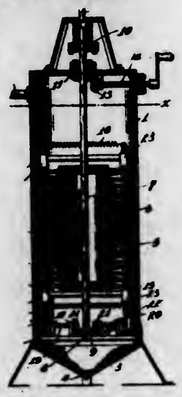
ares forming a cavity adapted to receive the body of a vessel with its

vided with openings for the reception of the uprights, links pivoted to the walls and frame, respectively, and rods carried by the frame and having their free ends provided with terminal handles.

11. A portable mold comprising a hopper having side and end walls pivoted thereto, and a combined carrying and operating member serving during its initial movement to move said walls to open and closed positions.

12. A portable mold comprising a hopper having side and end walls pivoted thereto, a vertically-slidable operating member for moving said walls to open and closed positions, and handles carried by the operating member for elevating and carrying said mold.

810,020. FILTER. CLARENCE R. APPLEGATE, Evansville, Ind., assignor of five-eighths to Simon A. Schmitt, Vanderburg county, Ind. Filed July 26, 1905. Serial No. 271,131.



Claim.—1. In a filter, the combination with a porous filtering-cylinder and a cleaning-brush therefor, of means coöperating with the brush and filtering-cylinder whereby relative turning or rotation of the brush and filtering-cylinder continuously in a given direction and relative simultaneous reciprocation or to-and-fro movement of said brush and filtering-cylinder may be obtained.

2. In a filter, the combination with a rotary porous filtering-cylinder, of a reciprocating brush bearing thereagainst, and means for rotating said cylinder and reciprocating said brush at the same time to cleanse the cylinder.

3. In a filter, the combination with a rotary porous filter-cylinder and a rotary pipe on which said cylinder is carried, of a reciprocatory brush bearing against said cylinder and gearing and a pitman operatively connecting said brush with the rotary pipe aforesaid, whereby the brush is reciprocated as the cylinder rotates.

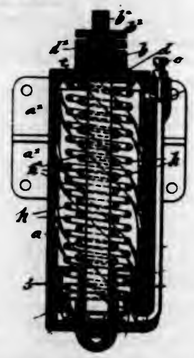
4. In a filter, the combination with a porous filtering-cylinder and a rotary pipe on which said cylinder is carried, of a reciprocatory brush bearing against said cylinder, upper and lower guides for said brush, and means operated from said rotary pipe for reciprocating said brush.

5. In a filter, the combination with a filter-casing, of a porous filtering-cylinder, a rotary pipe on which said cylinder is carried, upper and lower slotted guides extending across said filter-casing, brushes playing in said slotted guides, springs connecting the brushes together to keep them against the cylinder, and gearing and pitmen connecting the rotary pipe with the brushes, whereby the brushes are made to reciprocate as the cylinder revolves.

810,021. DOOR-CHECK. LUDWIG AUERBACH, New York, N. Y. Filed Dec. 24, 1904. Serial No. 238,182.

Claim.—1. In a door-check, the combination, with a casing, of a spindle turning in step-and-neck bearings in the bottom and cover of said casing, the intermediate portion of said spindle being square in cross-section, a plunger provided with a square socket slidable on the intermediate portion of said spindle and with bottom openings, and having an exterior thread or rib guided in helical grooves formed in the inner wall of the casing, a spring-actuated valve below said bottom openings, a helical spring interposed between the plunger and cover, and a regulable channel connecting the lower portion of the casing with the upper portion thereof.

2. In a door-check, the combination, with a casing attached to the door, of a rotatable spindle turning in step-and-neck bearings in the bottom and cover of said casing, a plunger provided with a square socket guided on said spindle and with openings extending therethrough, said plunger having an exterior rib guided in helical grooves formed in the inner wall of the casing, a spring-actuated valve below said plunger-openings, a helical spring interposed between the plunger and cover, a channel connecting the lower portion of the casing below the plunger with the upper portion thereof above said plunger, and a screw-plug for regulating the passage of liquid through said channel.



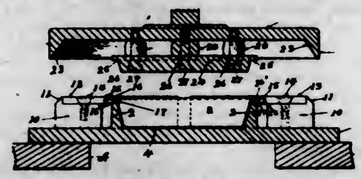
3. The combination, with a door, of a casing attached to the door, a spindle supported in step-and-neck bearings in the bottom and cover of said casing, said spindle being square in cross-section within the casing and having ends of circular cross-section rotatable in the bottom and cover, and a square upper end provided with an adjusting-column, a connecting-lever applied to the outer square ends of said spindle, a link connecting the outer end of said lever with the door-casing, a plunger guided by a rib in helical grooves formed in the inner wall of said casing and slidable on the square portion of said spindle, and a helical spring interposed between said plunger and the cover of said casing.

810,022. METHOD OF PRODUCING VITRIFIED BRICK, TILE, AND VARIOUS SHAPES. RALPH BAGGALEY, Pittsburg, Pa. Filed Dec. 23, 1903. Serial No. 186,235.

Claim.—1. The method herein described of utilizing the silicate-of-iron slag from copper-smelting furnaces for the production of vitrified articles, which consists in flowing the molten slag into molds to completely fill the same, confining the slag at the rapidly-cooling marginal portions of the mold in closed molds, and applying pressure to the central hotter portions of the slag, and subsequently cooling and annealing; substantially as described.

2. The method herein described of utilizing the silicate-of-iron slag from copper-smelting furnaces for the production of vitrified articles, which consists in flowing the molten slag into molds to completely fill the same, confining the slag at the rapidly-cooling marginal portions thereof and applying pressure to the central hotter portions of the slag, and subsequently cooling and annealing the molded articles in a body of comminuted material such as dry sand or granulated slag; substantially as described.

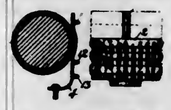
810,023. COLLAPSIBLE DIE FOR WIRING OR BRADING. LEONHARD BAUMER, Toledo, Ohio, assignor to The Lenhoss Manufacturing Co., Toledo, Ohio. Filed Nov. 16, 1904. Serial No. 233,080.



Claim.—1. In a wiring-die, the combination with a die-base adapted to rest on a press-bed and having a wall around its central area forming a cavity adapted to receive the body of a vessel with its unwired flange resting on and projecting over the top of the wall, of a plurality of pairs of guides on the base, the guides of each pair being parallel with a different line radial to the base center and the pairs being at intervals around the cavity-wall; die-blocks mounted on the guides and adapted to move convergingly toward and divergingly from the wall of the cavity; a die-plate mounted on each die-block having an inwardly-projecting portion provided with a grooved face semicircular in cross-section, the top portion of the die-grooves being adapted when the blocks are moved inward to engage the edge of the vessel-flange; a curved incut in the outer top portion of the cavity-wall opposite the grooves of the die-plates adapted to receive a wire; springs adapted to yieldingly hold the die-blocks normally diverged; a cushion press-disk adapted to be secured to a press-plunger and to be moved thereby to first engage a vessel in the cavity and press it on the wall and then simultaneously engage and converge the die-blocks until the grooves of the die-plates meet end to end around the curved incut of the wall.

2. In a wiring-die, the combination with a die-base adapted to rest on a press-bed and having a wall around its central area forming a cavity adapted to receive the body of an incomplete vessel with its unwired flange resting on and projecting over the top of the wall, of a plurality of pairs of guides on the base, the guides of each pair being parallel with a different line radial to the base center and the pairs being at intervals around the cavity-wall; die-blocks mounted on the guides and adapted to move convergingly toward or divergingly from the wall of the cavity, said die-blocks having outer faces that are arcs of a common circle, ends that are radial to the same circle, and inner faces that are parallel with the cavity-wall, said die-blocks being adapted to be converged to meet around and parallel with the cavity-wall of the base; a grooved die extension from the upper portion of the inner face of each of the die-blocks adapted when the die-blocks are converged around the wall to meet end to end and form a continuous groove, semicircular in cross-section, around the top portion of the cavity-wall; a curved incut in the outer top portion of the cavity-wall opposite the grooves of the die-blocks; springs adapted to yieldingly hold the die-blocks normally diverged; a bevel around the outer top portions of the die-blocks; a press-disk adapted to be secured to a press-plunger and provided with a cushioned plate to engage the vessel and a circumferential flange beveled to engage the bevels of the die-blocks, said cushioned plate being below the level of the flange and adapted to first engage the projecting flange of a vessel in the cavity and yieldingly press it on the wall as the plunger descends, and said beveled flange being thereafter adapted to simultaneously engage and converge the die-blocks and force their grooved die extensions into engagement with the vessel-flange, substantially as set forth.

810,024. TYPE-WHEEL ALINEMENT. CHARLES A. BENNETT, Dover, N. J. Filed Apr. 26, 1905. Serial No. 257,471.



Claim.—1. In a type-writer machine, the combination of guiding studs or projections arranged vertically above and below the printing position and a type-wheel, having all its type-faces confined to three rows, and having recesses corresponding to each type-face, one of the studs being adapted to coöperate with the recesses of the middle or bottom row, and the other stud being adapted to coöperate with the recesses of the upper row, depending on the vertical position of the type-wheel.

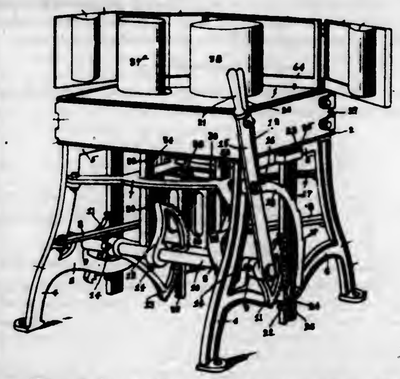
2. In a type-writing machine, the combination of a type-wheel having all of its type-faces contained within three rows, and three rows of recesses or perforations in the body of the type-wheel corresponding to the type-faces, with guiding and centering means adapted to be relatively extended into one of said recesses immediately preceding the instant of printing.

3. In a type-writing machine, a type-wheel having three cases of type-faces, each completely contained in a single row and having three rows of recesses or perforations corresponding to the positions of the type-faces, substantially as described and for the purpose specified.

4. In a type-writing machine, a paper-guide frame, projections or studs carried thereby above and below the printing position, and a type-wheel having three complete rows of type comprising three cases and having three rows of recesses or perforations corresponding to said type and adapted to coöperate with said projections, at the time and for the purpose specified.

5. In a type-writing machine, the combination of three projections or studs arranged vertically above and below the printing position, and a type-wheel having three rows of type and recesses corresponding to each type, adapted to coöperate with said projections immediately before the printing position.

810,025. MACHINE FOR MOLDING CONCRETE BLOCKS. WALTER C. BENNETT and JOHN F. SHYPANG, Toledo, Ohio. Filed Aug. 3, 1905. Serial No. 272,282.



Claim.—1. In a machine for molding concrete blocks, the combination with a mold-table having openings for the projection of cores above the table from beneath, of cores for the openings, an articulated mold adapted to surround one or more of the core-openings, means to project the cores singly or collectively through their respective openings into the mold, and to withdraw them therefrom, substantially as set forth.

2. In a machine for molding building-blocks, the combination of a support, a table provided with core-openings, mounted on the support, a core for each opening, means to jointly or severally project the cores different distances through their respective table-openings, and withdraw them therefrom, means to support the cores at different distances of projection through and above the table, and a plurality of articulated mold-boxes severally adapted either to individual or to collective use of the cores therein for the formation of complementary hollow structural blocks, substantially as set forth.

3. The herein-described molding-machine comprising a support, a mold-table mounted on the support, and provided with core-openings, a core for each opening, an upwardly and downwardly movable mold-frame surrounding the table, a rock-shaft journaled on the support, toothed segments mounted on the shaft, each adapted to be tightened or loosened thereon, stems for the cores and the mold-frame, each movable upwardly and downwardly in guides of the support, racks for the stems intermeshing with the segments, and adapted to move the stems as moved by the segments, a lever for the rock-shaft adapted to rock the segments jointly or severally as tightened on the shaft and thereby move the racks to severally or collectively project or withdraw the cores and the mold-frame, means to lock the lever at different distances of its movement and support the cores or the mold-frame at different elevations, and articulated molds adapted to be located on the table around the core-openings, substantially as set forth.

4. In a machine for molding concrete blocks, the combination with a box table-top mounted on a support, of a mold-frame telescopically mounted around the table-top and movable upwardly to raise portions of its sides and ends above the level of the table-top and form therewith a mold-box, and downwardly to withdraw the frame, means to raise and lower the mold-frame, means to support the mold-frame at different distances of its movement and a movable pallet mounted on the table-top and fitting the raised portions of the sides and ends of the mold-frame as a bottom.

5. In a machine for molding hollow wall-blocks, the combination with a table-top provided with core-openings, a movable core for each opening, and mechanism for projecting the cores through their respective openings singly or collectively, of a plurality of mold-

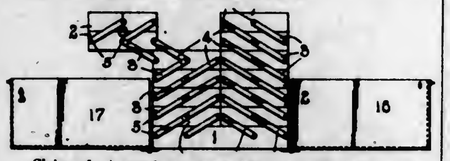
boxes respectively adapted to receive one or more of the cores and to

adapted to be unlocked and connected directly to the line wire, and

boxes respectively adapted to receive one or more of the cores and to form therewith complementary wall-blocks of different forms for the same or different courses, said mold-boxes comprising end plates hinged to the ends of one side plate, one removable side plate, and a half-core for one or both the end plates, adapted to form halves of joint-openings adapted to connect the central core-openings of blocks above and below the joint, substantially as set forth.

6. In a machine for molding concrete wall-blocks, the combination with a table-top provided with one elongated and one cylindrical core-opening, a movable core for each opening, and mechanism for jointly or severally projecting the cores through their respective openings, of two hinged mold-boxes one adapted to receive therein the elongated core and form therewith a hollow wall-block having half-joint openings, and the other to receive both the elongated and cylindrical core and form therewith a chimney-block having an extension adapted to bond with the wall-block, substantially as set forth.

810,026. SAMPLE-DISPLAY CASE. GEORGE F. BROSS, St. Louis, Mo. Filed Sept. 11, 1905. Serial No. 278,042.



Claim.—1. A sample-case comprising a plurality of trays, metal reinforcements on the inside of the tray ends and extending across the end and partially around the sides, pivots connected to said reinforcements and extending through the tray ends, and links connected to said pivots; substantially as described.

2. A sample-case comprising a plurality of trays, metal reinforcements at the ends of the trays, pivots passing through the reinforcements and the tray ends, said pivots having heads on the inner sides of the reinforcements, and links connected to said pivots; substantially as described.

3. A sample-case comprising a plurality of trays having reinforcements on the inner ends of less depth than the heights of the trays, bottoms for the trays secured to the ends thereof, and not to the reinforcements, pivots carried by the reinforcements and projecting through the tray ends, and links connected to the pivots; substantially as described.

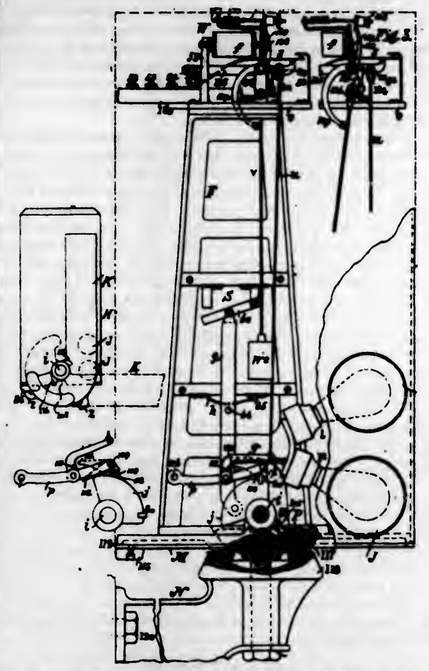
4. A sample-case comprising a bottom tray 1, a plurality of trays carried thereby, links 3 and 4 for connecting said trays one to the other, pivots 5 projecting through said links and through the tray ends, a reinforcement on the inside of each tray end and engaged by said pivots, and covers hinged to the tray 1 for inclosing said remaining trays; substantially as described.

810,027. ELECTRIC SIGNAL. CHARLES C. BLAKE, Brookline, Mass. Filed Aug. 19, 1905. Serial No. 274,577.

Claim.—1. A selective signal system consisting of a transmitting-station having a series of pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto; a series of way-stations each provided with a pendulum device adapted to respond to the vibrating of one only of said transmitting-pendulums, an electric-lamp signal and a semaphore-arm which becomes operative when the unison of vibrations is established between the transmitter and receiver.

2. A selective signal system consisting of a transmitting-station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line-wire, and when unlocked to operate a circuit-closing device and send characteristic impulses to line; a series of way-stations each provided with a pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, having a signal-lamp in a normally open circuit and a semaphore-arm locked to safety position, with means, when said pendulum device becomes responsive to said characteristic impulses, to close the lamp-circuit and unlock the semaphore-arm.

3. A selective signal system consisting of a transmitting-station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line-wire, and when unlocked to operate a circuit-closing device and send characteristic impulses to line, a local and second circuit-closing device with means for actuating the same and for maintaining the pendulum vibrations; a series of way-stations each provided with a pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, having a signal-lamp in a normally open circuit and a semaphore-arm locked to safety position, with means when said pendulum device becomes responsive to said characteristic impulses to close the lamp-circuit and unlock the semaphore-arm.



4. A selective signal system consisting of a transmitting-station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line-wire, and when unlocked adapted to operate a circuit-closing device and send characteristic impulses to line; a series of way-stations each provided with an electromagnetic device arranged to respond to the vibrations of one only of the transmitting-pendulums, having a signal-lamp in a normally open circuit, and a semaphore-arm locked to safety position with means, when said electromagnetic device becomes responsive to said characteristic impulses, to close the lamp-circuit and unlock the semaphore-arm, and ground the electromagnet of the device at the selected station.

5. A selective signal system consisting of a transmitting-station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line-wire, and when unlocked to operate a circuit-closing device and send characteristic impulses to line, a local and second circuit-closing device with means for intermittently actuating the same and for maintaining the pendulum vibrations; a series of way-stations each provided with an electromagnetic pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, having a signal-lamp in a normally open circuit and a semaphore-arm locked to safety position, with means when said pendulum device becomes responsive to said characteristic impulses to close the lamp-circuit, unlock the semaphore-arm, and ground the electromagnet of the device at the selected station.

6. A selective signal system consisting of a transmitting-station

having a series of independent pendulum devices adapted to send electric impulses of different periodicity over a line-wire when connected thereto, and means for maintaining the said impulses at a uniform rate of vibration; a series of way-stations each provided with an electromagnetic pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, a lamp in a normally open grounded circuit from a trolley-wire, a semaphore-arm locked to safety position, and means to close the lamp-circuit, unlock the semaphore-arm, and ground the electromagnet of the selected device.

7. A selective signal system consisting of a transmitting-station having a series of independent pendulum devices adapted to send electric impulses of different periodicity over a line-wire when connected thereto, means for maintaining the impulses at a uniform rate of vibration, the pendulum of each device being held in a retracted position and provided with a releasing mechanism arranged to be operative when connected to the line-wire a series of way-stations each provided with an electromagnetic pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, the magnets of each device being included in the line-circuit, a source of current a lamp in an open circuit to ground from the source of current, a semaphore-arm locked to safety position, with means to close the lamp-circuit, unlock the semaphore-arm and ground the magnet of the selected device.

8. A selective signal system consisting of a transmitting-station having a series of independent pendulum devices adapted to send electric impulses of different periodicity over a line-wire when connected thereto, means for maintaining the impulses at a uniform rate of vibration, the pendulum of each device being held in a retracted position and provided with releasing mechanism arranged to be operative when connected to the line-wire; a series of way-stations each provided with an electromagnetic pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, the magnets of each device in the line-circuit, a source of current, a normal lamp in an open circuit to ground from the source of current, a second lamp in a branch circuit with means for automatically including the latter lamp in the said open circuit and for intermittently shunting the same, a semaphore-arm locked to safety position with means to close the lamp-circuit, unlock the semaphore-arm and ground the magnet at the selected device.

9. A selective device consisting of a base part upon which rests a frame part, having concave and convex portions fitting into each other secured by a bolt and nut, the base part provided with means for attachment to a support or foundation; the frame part provided with a shaft carrying a semaphore-arm and a cam, a locking device, circuit-switches, an electromagnetic pendulum device composed of an electromagnet, its combined armature and adjustable spring-lever, a pendulum, with latching means for engaging with and operating a circuit-closer, the locking device and the said circuit-switches.

10. A selective signal system consisting of a transmitting-station having a series of independent pendulum devices adapted to send characteristic electric impulses over a line-wire, each pendulum normally held in a retracted position by a locking device, and having latching mechanism independently operating two circuit-closers whereby said impulses are sent to line when a pendulum device is connected therewith and unlocked, and a local magnet is energized to cause the pendulum to maintain its maximum rate of vibration; a line-wire normally disconnected at the transmitting-station, extending to a series of way-stations each provided with an electromagnetic pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums provided with a magnet its armature combined by an elastic connection with a lever for vibrating the receiving-pendulum provided with latching means, a lamp in an open and grounded circuit from a source of current, a semaphore-arm held to safety position by a locking device, with means to close the lamp-circuit, unlock the semaphore-arm and ground the magnet at the selected device.

11. The combination with a circuit-closer having a depending pawl, of a pendulum in the form of a lever of the first order provided with a catch on its short arm, and an adjustable weight upon its long arm, means for vibrating the pendulum consisting of an electromagnet, an armature therefor with a lever attached thereto whose lower end bears upon the long arm of the pendulum.

12. The combination with a circuit-closer having a depending pawl, of a pendulum in the form of a lever of the first order provided with a catch on its short arm, and an adjustable weight upon its long arm, means for vibrating the pendulum consisting of an electromagnet, an armature therefor with a lever in elastic connection therewith whose lower end bears upon the long arm of the pendulum.

13. Means for closing an electric circuit, consisting of a pendulum provided with a beveled catch, a pivoted lever whose free end is adapted to bear upon a circuit-closer and to carry a suspended pawl or latch, an electromagnet, its armature with a lever attached thereto whose lower end bears upon the pendulum.

14. Means for closing an electric circuit consisting of a pendulum provided with a beveled catch, a pivoted lever whose free end is adapted to bear upon a circuit-closer and to carry a suspended pawl or latch, an electromagnet, its armature with a lever in elastic connection therewith whose lower end bears upon the pendulum-rod.

15. A double circuit-closing device consisting of a pendulum provided with two beveled catches, two levers from which are suspended a pawl or latch, an electromagnet, its armature and a lever attached thereto whose lower end bears upon the pendulum-rod.

16. A locking and releasing device for signals, composed of a semaphore-arm upon a shaft secured to a frame with a cam having a pin or spline, a long lever pivoted to the frame, a short lever pivoted to the center of said long lever having an abutment or projection and a rod attached to its free end, a latch pivoted to the free end of the long lever whose free end is adapted to rest upon the abutment with a slot in the heel of the latch to embrace the said spline.

17. A pendulum locking and releasing device, consisting of a frame, a rod provided with a hole at its upper end out of center with a hole in the frame, its lower end connected to a lever pivoted to a support, said lever provided with notches to engage the end of the pendulum-rod, with a plug adapted to enter said holes and raise said rod.

18. A selective signal system consisting of a transmitting-station provided with a plurality of independent and normally detached means for transmitting electric impulses of different periodicity over a normally open line-wire; a series of way-stations each provided with a pendulum device adapted to respond to one of said transmitted periodicities only, and a semaphore-arm which becomes operative when the unison of frequencies is established between the transmitter and receiver.

19. A selective signal system consisting of a transmitting-station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line-wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected to the line-wire, and when unlocked to operate a circuit-closing device and send characteristic impulses to line; a series of way-stations each provided with a pendulum device arranged to respond to the vibrations of one only of the transmitting-pendulums, having a normally locked signal adapted to be displayed when said pendulum device becomes responsive to its characteristic impulses.

20. Means for closing an electric circuit responsive to characteristic impulses, consisting of an electromagnet, a pendulum provided with a lifting-catch adapted to be vibrated by the armature of said magnet and a circuit-closing device having a suspended pawl in the path of said catch, whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl and operate the circuit-closing device.

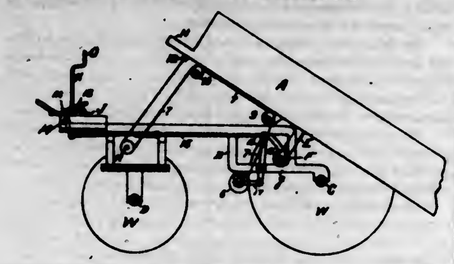
21. A selective signal system consisting of a transmitting-station provided with means for transmitting electric impulses of different periodicity over a line-wire; a series of way-stations each provided with a pendulum device consisting of an electromagnet, a pendulum provided with a lifting-catch adapted to be vibrated by the armature of said magnet, and a circuit-closing device having a suspended pawl in the path of the catch, whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl and operate the circuit-closing device.

22. Means for closing an electric circuit responsive to characteristic impulses; consisting of an electromagnet, a pendulum provided with a lifting-catch adapted to be vibrated by the armature of said magnet, a circuit-closing device having a suspended pawl in the path of said catch, and a semaphore-arm; whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl, operate the circuit-closing device, and display the semaphore-arm.

810,028. DUMPING-WAGON. FRANK BLOOMINGDALE, Voorheesville, N. Y. Filed July 21, 1905. Serial No. 270,609.

Claim.—1. In a dumping-wagon, the combination with a wagon of a pair of friction-rollers mounted adjacent to the rear wheels of said wagon; a shaft carrying said friction-rollers; a series of sheaves attached to the frame of said wagon and to the box; a cable passing over said sheaves attached to said box at one end and to the shaft carrying said friction-rollers at the other end; a means for causing

said friction-rollers to engage said wheels; a rack; a gear and pinion engaging said rack; a lever and dog for operating said gear and pinion; a connection between said rack and said box.



2. In a dumping-wagon; the combination with a wagon of a dumping-box connected therewith; a rack; a gear and pinion engaging said rack; a lever and dog for operating said gear and pinion; a connection between said rack and said box so connected up that by the operation of said lever said wagon may be moved forward or backward on its frame, substantially as described.

3. In a dumping-wagon, a movable box; a means for causing said box to move; a pair of friction-rollers; a clutch connected with the shaft upon which said friction-rollers are mounted; a means for causing said friction-rollers to be engaged by said clutch when the rollers are moved in one direction and to be disengaged when moved in the opposite direction; a means for setting said friction-rollers in contact with the wheels of said wagon and removing the same from contact therewith, substantially as described.

4. In a dumping-wagon; a movable box; a means for causing said box to move; a pair of friction-rollers; a shaft upon which said friction-rollers are mounted; a clutch connected with said shaft; a means for causing said friction-rollers to be engaged by said clutch when the rollers are moved in one direction and to be disengaged when moved in an opposite direction; a means for setting said friction-rollers in contact with the wheels of said wagon; and removing the same from contact therewith; with a rack; a gear and pinion engaging said rack; a lever and dog for operating said gear and pinion; a connection between said rack and said box, substantially as described.

5. In a dumping-wagon, the combination with a wagon of a pair of friction-rollers mounted adjacent to the rear wheels of said wagon; a shaft carrying said friction-rollers; a series of sheaves attached to the frame of said wagon and to the box; a cable passing over said sheaves attached to said box at one end and to the shaft carrying said friction-rollers at the other end; a means for causing said friction-rollers to engage said wheels; a clutch connected with said shaft, a means for causing said friction-rollers to be engaged by said clutch when the rollers are moved in one direction and to be disengaged when moved in the opposite direction.

810,039. BALING-PRESS. CLARENCE B. BOWEN, Denver, Colo. Filed Apr. 17, 1905. Serial No. 255,126.

Claim.—1. In a baling-press, the combination with a baling-chamber and plunger-beam, of a power-shaft provided with a trip-lever, a swing-lever fulcrumed on the frame, and a flexible device connecting the swing-lever and the plunger-beam, and acting to move the latter in the direction of pressure.

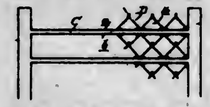
2. In mechanism of the class described, the combination of a plunger-beam, a power-shaft, a trip-lever fast on the power-shaft, a swing-lever fulcrumed on the frame, the trip-lever being arranged to act on the swing-lever and the plunger-beam, and a flexible connection between the swing-lever and the forward extremity of the plunger-beam, the said connection passing around the power-shaft which is engaged by said connection during a portion of the forward movement of the plunger.

3. In operating mechanism for baling-presses, the combination of a plunger-beam, a power-shaft, a trip-lever mounted on the power-shaft and having antifrictional rollers in its extremities, the forward extremity of the plunger-beam being provided with a pocket adapted to receive the roller extremities of the trip-lever, a swing-lever fulcrumed on the frame on the opposite side of the power-shaft from the plunger-beam, and a connection between the swing-lever and the forward extremity of the plunger-beam, the said connection comprising a flexible device whose extremities are connected with the swing-lever, the said flexible device also passing around a suitable bearing with which the plunger-beam is provided, the flexible device being also in position to engage the power-shaft, as the plunger-beam moves forwardly.

4. In mechanism of the class described, the combination of a plunger-beam, a power-shaft, a trip-lever, a swing-lever and a connection between the swing-lever and the forward extremity of the plunger-beam, comprising two flexible devices having their extremities connected with the swing-lever above and below, the said devices also passing around suitable bearings with which the plunger-beam is provided, substantially as described.

5. In mechanism of the class described, the combination with a plunger-beam, of a power-shaft provided with a trip-lever, a swing-lever suitably fulcrumed on the frame, and a flexible connection between the swing-lever and the plunger-beam comprising a chain and a wheel, the extremities of the chain being connected with one member and the wheel being mounted on the other member, the chain passing around the wheel for the purpose set forth.

810,080. COOLER. BENJAMIN BERNON, Detroit, Mich., assignor to Bernon Manufacturing Company, Detroit, Mich., a Corporation of Michigan. Filed Sept. 28, 1903. Serial No. 174,021.



Claim.—1. In a cooler, a liquid-conduit comprising a flattened tube having the parallel walls thereof in close proximity, and an inwardly-extending rib on said tube for holding said parallel walls spaced from each other, and a radiating flange sleeved upon said tube.

2. In a cooler, the combination of a liquid-conduit formed of a flattened tube having parallel walls thereof in close proximity, and an inwardly-extending rib on said tube formed by seaming the adjoining ends of said tube, for holding said parallel walls spaced from each other.

3. In a cooler, the combination with a flattened liquid-conduit of a radiating flange therefor, formed of sheet metal struck up to form oppositely-angled flanges, and slitted at the angle to be sleeved on said conduit.

4. In a cooler the combination with a flattened liquid-conduit of a plurality of radiating flanges therefor, each comprising a sheet-metal blank struck up to form oppositely-angled flanges, and slitted to be sleeved on said conduit, said flanges being arranged in series on said conduit, alternately oppositely inclined to form transversely-extending air-passages and being apertured for air circulation, transverse to said passages.

5. In a cooler the combination of a plurality of parallel flattened liquid-conduits, and a series of radiating flanges on each conduit, formed from sheet metal, and struck up to form oppositely-angled flanges, and slitted at the angle to be sleeved on said conduits, said flanges being alternately arranged so that together they form diamond-shaped conduits with the flanges in one series inserted between adjacent flanges in the parallel series.

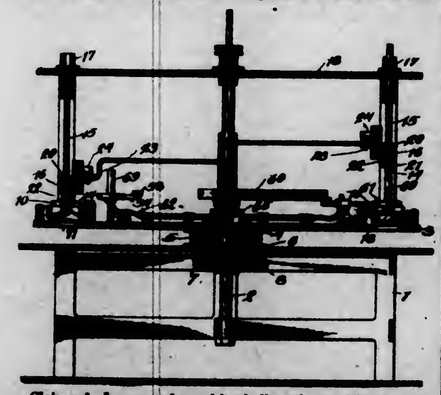
6. In a cooler, the combination with a plurality of fluid-conduits, of separately-formed flanges projecting therefrom and arranged at oppositely-disposed angles, the flanges on adjacent tubes interlocking.

7. In a cooler, the combination with a conduit, of a radiating flange therefor, struck up to form oppositely-angled flanges, and apertured through the angle portion to be sleeved on said conduit.

8. In a cooler, a series of liquid-conduits and oppositely-disposed radiating flanges arranged in criss-cross fashion in the space between the conduits to form a series of closely-associated air-passages therebetween, said flanges being apertured for the reception of said conduits.

9. In a cooler, the combination of a liquid-conduit comprising a flattened tube having parallel walls in close proximity and a radiating flange sleeved upon said tube of an inwardly-extending bead or corrugation in the wall of said tube, the said bead or corrugation constituting a means for holding the parallel walls spaced from each other and affording a means of expansion for said conduit in case of freezing.

810,081. PRESS FOR MAKING GLASS ARTICLES. HENRY M. BROOKFIELD, New York, N. Y. Filed Apr. 6, 1903. Serial No. 151,269.



Claim.—1. In a press for making hollow glass articles, the combination of a mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position and the third section moved into its place and closed, a plunger, cam-surfaces connected with the plunger and cooperating with the other cam-surfaces to open and close the sections of the mold at proper times, and means to form the glass in the third section of the mold.

2. In a press for making hollow glass articles, the combination of a mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position and the third section moved into its place and closed, means for opening and closing the sections of the mold at proper times, a plunger to give the article a preliminary forming in the second section of the mold, and a blowing device adapted to blow the glass so as to fill the interior space of the third section, and a cam to move the blowing device into operative position over the mold, and a spring to move the blowing device away from the mold.

3. The combination of a mold for making hollow glass articles, a plunger, means for operating the plunger, the blower-head 61, a pivoted lever carrying the blower-head, means for operating the lever so as to bring the blower-head over or away from the mold, the spring 57, and means for causing the plunger to press the blower-head down on the mold and the valve 67 and the pins 68.

4. In a press for making hollow glass articles, the combination of a mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position and the third section moved into its place and closed, rock-shafts connected with the parts of the mold, cam-surfaces connected with the rock-shafts, a cross-head, a plunger carried by the cross-head, cam-surfaces on the cross-head cooperating with the other cam-surfaces to open and close the sections of the mold at the proper times, and means to form the glass in the third section of the mold.

5. In a press for making hollow glass articles, the combination of a mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position and the third section moved into its place and closed, rock-shafts connected with the parts of the mold, cam-surfaces connected with the rock-shafts, a cross-head, a plunger carried by the cross-head, cam-surfaces on the cross-head cooperating with the other cam-surfaces and springs acting in opposition to the cam-surfaces, the parts being arranged to open and close the sections of the mold at the proper times, and means to form the glass in the third section of the mold.

6. In a press for making hollow glass articles, the combination of a mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position and the third section moved into its place and closed, means for opening and closing the first and second sections of the mold at the proper times, rock-shafts connected with the parts of the third section of the mold, arms carried by said rock-shafts, cam-surfaces connected with the rock-shafts, a cross-head, a plunger carried by the cross-head, cam-surfaces on the cross-head cooperating with the other cam-surfaces to open or close the third section of the mold, a spring connecting the arms on the rock-shafts and acting in opposition to the cam-surfaces, latches to engage the arms, and pawls carried by the cross-head and adapted to trip the latches, substantially as set forth.

7. In a press for making hollow glass articles, the combination of a rotary table, a plurality of molds rotating with the table, each mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position, and the third section moved into its place and closed, a plurality of cross-heads one for each mold, guides rotating with the table in which the cross-heads reciprocate, a plurality of plungers one carried by each cross-head, cam-surfaces connected with the parts of each mold, cam-surfaces connected with each cross-head and cooperating with the other cam-surfaces to open and close the sections of the mold at the proper times, a stationary cam to operate the cross-heads, and means to form the glass in the third section of each mold, substantially as set forth.

8. In a press for making hollow glass articles, the combination of a rotary table, a plurality of molds rotating with the table, each mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position, and the third section moved into its place and closed, a plurality of cross-heads one for each mold, guides rotating with the table in which the cross-heads reciprocate, a plurality of plungers one carried by each cross-head, cam-surfaces connected with the parts of each mold, cam-surfaces connected with each cross-head and cooperating with the other cam-surfaces to open and close the sections of the mold at the proper times, a stationary cam to operate the cross-heads, and a plurality of blowing devices, one for each mold, adapted to blow the glass so as to form it in the third section of the mold.

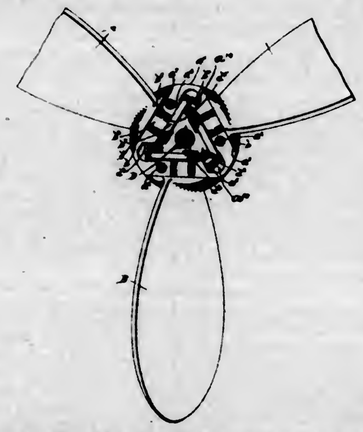
9. In a press for making hollow glass articles, the combination of a rotary table, a plurality of molds rotating with the table, each mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position, and the third section moved into its place and closed, a plurality of cross-heads one for each mold, guides rotating with the table in which the cross-heads reciprocate, a plurality of plungers one carried by each cross-head, cam-surfaces connected with the parts of each mold, cam-surfaces connected with each cross-head and cooperating with the other cam-surfaces to open and close the sections of the mold at the proper times, a stationary cam to operate the cross-heads, and a plurality of blowing devices, one for each mold, adapted to blow the glass so as to form it in the third section of the

mold, and means automatically actuated to move the blowing devices into and out of operative position at the proper times.

10. In a press for making hollow glass articles, the combination of a rotary table, a plurality of molds rotating with the table, each mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position, and the third section moved into its place and closed, a plurality of cross-heads one for each mold, guides rotating with the table in which the cross-heads reciprocate, a plurality of plungers one carried by each cross-head, cam-surfaces connected with the parts of each mold, cam-surfaces connected with each cross-head and coöperating with the other cam-surfaces to open and close the sections of the mold at the proper times, a stationary cam to operate the cross-heads, and a plurality of blower-heads, one for each mold, rotating with the table and connected with a source of fluid under pressure, and a valve in each blower-head, and a stationary cam to operate the blower-heads at the proper times.

11. In a press for making hollow glass articles, the combination of a rotary table, a plurality of molds rotating with the table, each mold consisting of three sections, each section divided vertically, so arranged that the second section can be opened and moved out of operative position, and the third section moved into its place and closed, a plurality of cross-heads one for each mold, guides rotating with the table in which the cross-heads reciprocate, a plurality of plungers one carried by each cross-head, cam-surfaces connected with the parts of each mold, cam-surfaces connected with each cross-head and coöperating with the other cam-surfaces to open and close the sections of the mold at the proper times, a stationary cam to operate the cross-heads, and a plurality of blower-heads, one for each mold, rotating with the table and connected with a source of fluid under pressure, and an automatic valve in each blower-head, and a stationary cam to operate the blower-heads at the proper times.

810,082. PROPELLER. ALEXANDER T. BROWN, Syracuse, N. Y. Filed Apr. 12, 1902. Serial No. 102,863.



Claim.—1. The combination with the shaft of a reversible propeller, of the divided hub, the reversible blades pivoted between the front and rear sections of the hub and provided with the cranks, the sliding head movable lengthwise of the shaft and having flanges contiguous to the cranks, pin-and-slot connections between the cranks and the flanges, said flanges being situated in planes tangential to the shaft, and each crank rotating in a plane parallel with and closely adjacent a flange, said plane cutting the proximate flange transversely near its base, substantially as and for the purpose described.

2. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having two series of substantially flat engaging faces within its internal cavity, each face of either series being opposed to a face of the other series and arranged substantially parallel with said opposing face, said hub having openings leading from the cavity through the outer surface of the hub, blades having their inner ends provided with spindles journaled in the openings, cranks within the cavity projecting from the spindles and engaging one series of said faces, and an adjusting member connected to the cranks within the cavity for moving the blades on their axes, said adjusting member being provided with a plurality of faces engaging the other series of said faces of the hub, substantially as described.

3. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having two series of triangularly-arranged engaging faces within its internal cavity, each face of either series being opposed to a face of the other series and arranged substantially parallel with said opposing face, said hub having openings leading from the cavity through the outer surface of the hub, blades having their inner ends provided with spindles journaled in the openings, cranks within the cavity projecting from the spindles and engaging one series of said triangularly-arranged faces, and an adjusting member connected to the cranks within the cavity for moving the blades on their axes, said adjusting member being provided with triangularly-arranged faces engaging the other series of said faces of the hub, substantially as described.

4. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having its internal cavity formed with a main part and openings leading from said main part, blades having their inner ends provided with spindles journaled in the hub, and an adjusting member movable in the main part of the cavity and connected to the spindles for moving the blades on their axes, the adjusting member being provided with projecting arms extended into said openings and having faces abutting against the contiguous walls of said openings, substantially as described.

5. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having its internal cavity formed with a main part and triangularly-arranged openings leading from said main part, triangularly-arranged blades having their inner ends provided with spindles journaled in the hub and an adjusting member movable in the main part of the cavity and connected to the spindles for moving the blades on their axes, said adjusting member being provided with triangularly-arranged arms projecting into the openings and having faces abutting against the contiguous walls of said openings, substantially as described.

6. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having its internal cavity formed with a main part of angular cross-section and openings extending from each angle of said main part, one of the walls of each of said openings forming substantially a continuation of one of the angularly-arranged sides of the main part of the cavity, angularly-arranged blades having their inner ends provided with spindles journaled in the hub, and an adjusting member arranged in the main part of the cavity and provided with angularly-arranged arms connected to the spindles for moving the blades on their axes and projecting into the openings and having faces abutting against the contiguous walls of said openings, substantially as described.

7. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having two series of engaging faces within its internal cavity, each face of either series being opposed to a face of the other series and arranged substantially parallel with said opposing face, said hub having openings leading from the cavity through the outer surface of the hub, blades having their inner ends provided with spindles journaled in the openings, cranks within the cavity provided on the spindles, said cranks having outer faces engaging one series of the faces of the hub, and inner faces substantially parallel with said outer faces, and an adjusting member having projecting arms connected to the cranks for moving the blades on their axes, each of said projecting arms being provided with substantially parallel faces respectively engaging the opposing inner face of the crank connected thereto and the contiguous face of the other series of said faces of the hub, substantially as described.

8. In combination, a shaft, a hollow propeller-hub mounted on the shaft and having two series of triangularly-arranged engaging faces within its internal cavity, each face of either series being opposed to a face of the other series and arranged substantially parallel with said opposing face, said hub having triangularly-arranged openings leading from the cavity through the outer surface of the hub, blades having their inner ends provided with spindles journaled in the openings, cranks within the cavity provided on the spindles, said cranks having outer faces engaging one series of the triangularly-arranged faces of the hub and inner faces substantially parallel with said outer faces, pivotal pins projecting from the inner faces of the cranks, and an adjusting member having triangularly-arranged projecting arms formed with open-ended slots extending inwardly from their end surfaces for receiving the pivotal pins and permitting their ready detachment from the adjusting member, each of said projecting arms being provided with substantially parallel faces respectively engaging the inner face of the opposing crank connected thereto and the contiguous face of the other series of said triangularly-arranged faces of the hub, substantially as described.

9. In a triple-blade propeller, the combination with a drive-shaft, of a hub mounted thereon having a cavity therein triangular in cross-section and openings leading from each angle thereof into the body of the hub, blades having spindles journaled in said hub, a triangular head arranged in said cavity having extensions from the angles thereof projecting into said openings with one of their faces abutting against the adjacent walls of the latter, arms fixed to said spindles arranged between the sides of the head and the adjacent walls of the cavity within the hub, pivotal connections between said arms and said extensions, and means for reciprocating the head, substantially as described.

10. The combination with the shaft of a reversible propeller, of the divided hub, the reversible blades pivoted between the front and rear sections of the hub and provided with the cranks, the sliding head movable lengthwise of the shaft and having notched flanges adapted to engage with the cranks, said flanges being situated in planes tangential to the shaft, and each crank rotating in a plane parallel with and closely adjacent the flange it engages, said plane cutting the proximate flange transversely near the bottom of its notch.

11. The combination with the shaft of a reversible propeller, of the divided hub, the reversible blades pivoted between the front and rear sections of the hub and provided with cranks, the sliding head movable lengthwise of the shaft and having notched flanges adapted to engage the cranks, said cranks each rotating in a plane parallel with and closely adjacent a flange and closely adjacent the shaft and within a circle passing through the notches, said notches being distant from the shaft by less than the length of a crank.

12. The combination with the shaft of a reversible propeller, of the divided hub, the reversible blades pivoted between the front and rear sections of the hub, and provided with cranks and provided with stems and with bosses having their outer surfaces curved to correspond with the hub, the sliding head having the flanges, the pin-and-slot connections between the crank-arms and the flanges, and the slide attached to the head, said hub being cut away on the exterior to form seats for bosses and having its wall thickened on the side adjacent the crank-stems, all substantially as set forth, whereby the contour of the bosses and hub are made continuously similar and the crank operatively supported in close proximity to the shaft.

13. The combination with the shaft of a reversible propeller, of the divided hub, the reversible blades pivoted between the front and rear sections of the hub and provided with cranks and provided with stems and bosses, the sliding head having the flanges, the pin-and-slot connections having the crank-arms and the flanges, and the slide attached to the head, said hub being cut away on the exterior to form seats for bosses, and having its wall thickened on the side adjacent the crank-stems, all substantially as set forth, whereby the crank is operatively supported in close proximity to the shaft.

14. In a propeller, the combination of a shaft, a sliding head supported by the shaft and having a plane surface with a slotted flange projecting from one side thereof, a propeller-blade, a crank on said blade lying on the said plane surface of the slide, a crank-pin playing in the slot of the flange, the crank being constructed and arranged to bear against the flange of the slide as the position of the blade is changed, and a hub in which the blade is mounted to turn.

810,083. SECTIONAL CASE. CLARENCE P. BYRNES, Pittsburg, Pa. Filed Jan. 15, 1901. Serial No. 43,262.

Claim.—1. In sectional cases, a pair of superimposed sections having irregular joints at their ends, and a single separating-partition forming the top of one section and the bottom of the next, said partition crossing the line of the joints between the sections; substantially as described.

2. In sectional cases, a pair of superimposed sections having end joints on irregular lines extending through the end boards, and a single separating-partition having a part thereof secured to one of said sections and crossing the line of the end joints between the sections; substantially as described.

3. A pair of superimposed sectional cases, having an irregular joint, and a single horizontal partition having a part secured to one of said sections, and crossing the line of the joint so as to butt against the end board of the next section, said partition concealing a portion of the joint; substantially as described.

4. In sectional cases, a pair of superimposed sections having irregular joints at their ends, a single separating-partition between the sections, and crossing the line of the joints between them, and exterior cover-strips secured to one section and covering the end joints between the sections; substantially as described.

5. In sectional cases, a pair of separate superimposed sections, each section having an end swinging door, the top and bottom edges of the doors fitting neatly together, and a projecting cover-strip secured to one door and covering the horizontal joint between the doors; substantially as described.

6. In sectional cases, a pair of separate superimposed sections with interfitting end joints, said sections having horizontally-swinging doors hinged to their ends, and mechanism for securing the doors rigidly together to swing as one, the doors when closed lying in a plane in front of the edge of the partition between the sections; substantially as described.

7. In sectional cases, a pair of superimposed sections with interfitting end joints, each section having a movable door and a strip secured along the horizontal edge of one door and covering the joint between the top of one door and the bottom of the next, the doors when closed lying in a plane in front of the edge of the partition between the sections; substantially as described.

8. In sectional cases, a pair of superimposed receiving-sections, each having a back and sides with an open end, said sections having interfitting side joints between them arranged to prevent sidewise displacement of one section relative to the other, intermediate adjustable shelves in the sections, and separate swinging doors, one for each section, pivoted upon vertical axes at the edges of the sections and arranged to swing horizontally; substantially as described.

9. In adjustable cases, a pair of superimposed sections having end swinging glass doors, with their adjacent horizontal rails fitting together, a cover-strip for the joint between the doors, and a latch device on one of said doors; substantially as described.

10. In sectional cases, a pair of superimposed sections, one of the sections having an intermediate shelf therein, a separating-partition between the sections, each section having a door opening endwise, one of said doors having a horizontally-extending rail portion covering the horizontal front joint between the sections; substantially as described.

11. In sectional cases, a pair of separate superimposed sections having a separating-partition, said sections having irregular joints crossing a part of said partition, and cover-strips secured to one section and covering the joints; substantially as described.

12. In sectional cases, a pair of superimposed sections, each section having an end swinging door with their horizontal edges fitting together, a cover-strip arranged to conceal the horizontal joint between the doors, and cover-strips secured to one section and covering the end joints between the sections; substantially as described.

13. In sectional cases, a pair of separable superimposed sections with end joints, each section having an end swinging door, a dowel-pin connection between the adjacent rails of the doors of the two sections, a cover-strip for the joint between the doors, and a latch device secured to one door at a point adjacent to the joint with the other door; substantially as described.

14. In sectional cases, a pair of separable vertical sections having a single separating-partition and with an irregular end joint between them, a cover-strip hiding the joint, and a vertical strip for the end face of the case of substantially the same width as the cover-strip; substantially as described.

15. In sectional cases, a pair of superimposed receiving-sections, each having a back and sides with an open end, said sections having interfitting side joints between them arranged to prevent sidewise displacement of one section relative to the other, intermediate adjustable shelves in the sections, and separate swinging doors, one for each section, pivoted upon vertical axes at the edges of the sections and arranged to swing horizontally, the top rail of one door fitting neatly against the bottom rail of the next door above; substantially as described.

16. In sectional cases, a pair of superimposed receiving-sections, each having an open end and provided with a back and sides, a transverse piece connecting the sides of the section and arranged to prevent outward bulging, said sections having interfitting side joints to prevent sidewise displacement of one section relative to the other, intermediate adjustable shelves in the sections, separate doors, one for each section, pivoted on vertical axes at the edges of the sections, the side rails of the doors being arranged to hide the end joints of the

connecting-piece between the sides, when the door is closed; substantially as described.

17. In sectional cases, a pair of superimposed receiving-sections, each having an open end and provided with a back and sides, a transverse piece connecting the sides of the section and arranged to prevent outward bulging, said sections having interfitting side joints to prevent sidewise displacement of one section relative to the other, intermediate adjustable shelves in the sections, separate doors, one for each section, pivoted on vertical axes at the edges of the sections, the side rails of the doors being arranged to hide the end joints of the connecting-piece between the sides, when the door is closed, the top rail of one door embracing the extreme top portion of the bottom rail of the next door below and fitting neatly against the bottom rail of the next door above; substantially as described.

18. In sectional cases, a pair of superimposed receiving-sections, which have open ends, each section having a back and sides, interfitting joints between the sections arranged to prevent displacement of one relative to the other, said sections having adjustable shelves, a top and bottom section, adapted to close the open end of the adjacent respective preceding section, means for preventing sidewise bulging of each section, and separate swinging doors extending entirely across the front of the section pivoted on vertical axes at the edges of the sections and arranged to swing horizontally; substantially as described.

19. In sectional cases, a pair of superimposed receiving-sections, each having an open end and comprising a back and sides, a top and bottom section having closed fronts, said sections having interfitting joints arranged to prevent displacement of one section relative to the other, intermediate shelves in the receiving-sections, means for preventing the sides of said sections from bulging outwardly, said means comprising transverse pieces connecting the sides, the receiving-sections having swinging doors extending entirely across the front of the section pivoted on vertical axes at the edges of the sections and arranged to swing horizontally; substantially as described.

20. In sectional cases, a pair of superimposed receiving-sections, each having an open end and comprising a back and sides, a top and bottom section having closed fronts, said sections having interfitting joints arranged to prevent displacement of one section relative to the other, intermediate shelves in the receiving-sections, means for preventing the sides of said sections from bulging outwardly, said means comprising transverse pieces connecting the sides, the receiving-sections having swinging doors pivoted on vertical axes at the edges of the sections and arranged to swing horizontally, the top rail of one door fitting neatly against the bottom rail of the next door to close the joint between the sections; substantially as described.

21. In a sectional case, a pair of similar superimposed receiving-sections, each having an open end and provided with a back and sides, a transverse piece connecting the sides of the section and arranged to prevent outward bulging, said sections having interfitting top and bottom joints to prevent displacement of one section relative to the other, intermediate adjustable shelves in the sections, and separate doors, one for each section, pivoted on vertical axes at the edges of the sections, the top and bottom rails of the doors fitting together when closed to hide any shelf or connecting-piece between the two sections; substantially as described.

22. In sectional cases, a pair of superimposed receiving-sections, each having an open end and provided with a back and sides, a transverse piece connecting the sides of each section to prevent bulging of said sides, said sections having interfitting joints at their sides which prevent sidewise displacement of one section relative to the other, an intermediate shelf in each section, separate doors for each section, each door being pivoted on a vertical axis at the side edge of the section, the side rails of the doors when closed hiding the end joints of the transverse connecting-piece, the top rail of one door fitting neatly to the bottom rail of the door of the next section above; substantially as described.

23. In sectional cases, a pair of superimposed receiving-sections, each having an open end and provided with a back and sides, a transverse horizontally-extending piece connecting the sides of each section to prevent bulging of said sides, said sections having interfitting joints at their sides which prevent sidewise displacement of one section relative to the other, an intermediate shelf in each section, separate doors for each section, each door being pivoted on a vertical axis at the side edge of the section, the side rails of the doors when closed hiding the end joints of the transverse connecting-piece.

810,084. CAN-FILLING APPARATUS. ANTONIO CERRUTI, San Francisco, Cal., assignor to California Fruit Canners Association, San Francisco, Cal., a Corporation of California. Filed Jan. 31, 1905. Serial No. 243,516.

Claim.—1. A can-filling apparatus, comprising a liquid-containing vessel, a flexible resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, the emerging end of said plate having an adjustable connection with said vessel whereby the plate may be adjusted longitudinally thereof to vary the inclination of said emerging end.

2. A can-filling apparatus, comprising a liquid-containing vessel, a resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, said plate having one end disposed to receive the cans and direct them down into the liquid, and the other end disposed to direct the emerging cans to their destination, and means for adjusting the plate longitudinally and thereby varying the inclination of the emerging-slope thereof, and means for advancing the cans along said resting-plate.

3. A can-filling apparatus, comprising a liquid-containing vessel, a resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, said plate having one end disposed to receive the cans and direct them down into the liquid, and the other end disposed to direct the emerging cans to their destination, a variable connection for the delivery end of said resting-plate adapted to vary the inclination of its emerging-slope, and means for advancing the cans along said resting-plate.

4. A can-filling apparatus, comprising a liquid-containing vessel, a flexible resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, said plate having one end disposed to receive the cans and direct them down into the liquid and the other end disposed to direct the emerging cans to their destination, means for varying the inclination of said plate at its discharge end by a longitudinal adjustment thereof, fixed guides above and parallel with the resting-plate, to hold the cans down thereon, and means for advancing the cans along said resting-plate.

5. A can-filling apparatus, comprising a liquid-containing vessel, a resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, said plate having one end disposed to receive the cans and direct them down into the liquid, and the other end disposed to direct the emerging cans to their destination, fixed guides above and parallel with the resting-plate, to hold the cans down thereon, an overlying screen secured to said guides and parallel with said plate to confine the contents of the cans while passing through the liquid, and means for advancing the cans along said resting-plate.

6. A can-filling apparatus comprising a liquid-containing vessel, a traveling conveyer therein, suitable guides for directing the conveyer into and out of said vessel by an entrance and an emerging slope and along the bottom of the vessel, a resting-plate for the cans lying above and conforming to the course of the conveyer, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel, and to discharge them from the end of said plate, and means for varying the inclination of the emerging-slope of the resting-plate.

7. A can-filling apparatus comprising a liquid-containing vessel having sloping ends, a traveling conveyer therein, suitable guides for directing the said conveyer through the liquid in said vessel in a course conforming to the sloping ends and bottom thereof, a resting-plate for the cans lying above and conforming to the course of the conveyer, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel and to discharge them from the end of said plate, and a variable connection for the delivery end of said resting-plate adapted to vary the inclination of the emerging-slope of said plate.

8. A can-filling apparatus comprising a liquid-containing vessel, a traveling conveyer therein, suitable guides for directing said conveyer into and out of said vessel by an entrance and an emerging slope and along the bottom thereof, a flexible resting-plate for the cans lying above and conforming to the course of the conveyer, means for varying the inclination of the emerging end of said plate by a longitudinal adjustment thereof, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel and to discharge them from the end of said plate, and fixed guides above and parallel with the plate to hold the cans down upon said plate as they pass through the liquid.

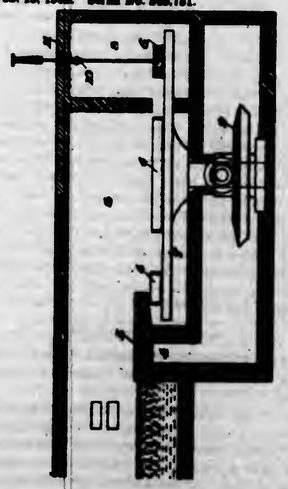
9. A can-filling apparatus comprising a liquid-containing vessel, a traveling conveyer therein, suitable guides for directing said conveyer into and out of said vessel by an entrance and an emerging slope and along the bottom thereof, a resting-plate for the cans lying above and conforming to the course of the conveyer, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel, and to discharge them from the end of said plate, fixed guides above and parallel with the plate to hold the cans down upon said plate as they pass through the liquid, and an overlying screen secured to said guides and parallel with the plate to cover the open tops of the cans during their passage through the liquid.

10. A can-filling apparatus comprising a liquid-containing vessel having sloping ends, a traveling conveyer therein, suitable guides for directing said conveyer through the liquid in said vessel in a course conforming to the sloping ends and bottom thereof, a resting-plate for the cans lying above and conforming to the course of the conveyer, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel and to discharge them from the end of said plate, means for adjusting to varying angles the emerging-slope of said resting-plate, and overlying fixed guides for holding the cans down upon the plate, as they pass through the liquid vessel.

11. A can-filling apparatus comprising a liquid-containing vessel having sloping ends, a traveling conveyer therein, suitable guides for directing the conveyer through the liquid in said vessel in a course conforming to the sloping ends and bottom thereof, a resting-plate for the cans lying above and parallel with the conveyer, arms on the conveyer to engage the cans and carry them forward on the resting-plate through the liquid in the vessel and to discharge them from the end of the said plate, means for adjusting to varying angles the emerging-slope of said resting-plate, overlying fixed guides for holding the cans down upon the plate as they pass through the liquid vessel, and an overlying screen secured to said guides to cover the open tops of the cans during their passage through the liquid.

12. A can-filling apparatus, comprising a liquid-containing vessel, a resting-plate for the cans, sloping from each end down into said vessel and continuing along its bottom, said plate having one end disposed to receive the cans and direct them down into the liquid, and the other end disposed to direct the emerging cans to a conveyer, means for advancing the cans along said resting-plate, the said conveyer arranged adjacent the discharge end of said resting-plate, and a variable connection for the delivery end of said resting-plate.

810,085. APPARATUS FOR DRAWING GLASS. JAMES A. CHAMBERS, Allegheny, Pa., assignor to William J. Patton, Allegheny, Pa. Filed Feb. 15, 1905. Serial No. 245,731.

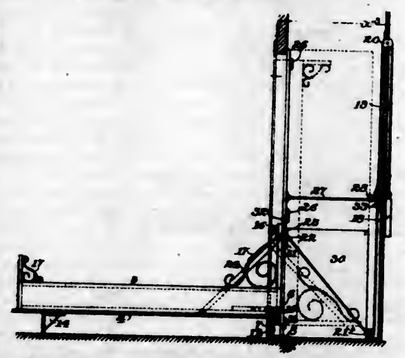


Claim.—1. In a glass-drawing apparatus, a tank-furnace having a heated pot-chamber, and a close drawing-chamber communicating therewith, in combination with a carrier, having a pot or receptacle, said carrier being adapted to carry the pot or receptacle from the pot-chamber to the drawing-chamber and then back to the pot-chamber, substantially as described.

2. A tank-furnace having a pot-chamber and a casting-outlet leading from the tank to the pot-chamber, and a drawing-chamber in combination with a carrier having pots or receptacles and means for so moving the carrier intermittently as to bring the pots or receptacles from the pot-chamber to the drawing-chamber and then back to the pot-chamber, substantially as described.

3. In a glass-drawing apparatus a heated chamber communicating with the tank-chamber, and containing a carrier having pots or receptacles, means for feeding glass from the tank into said pots or receptacles, a drawing-chamber through which the carrier moves, said chamber having an opening in the roof thereof, glass-drawing apparatus adapted to draw the glass through said opening, and means for so moving the carrier intermittently as to bring the pots or receptacles from the pot-chamber to the drawing-chamber, and then back to the pot-chamber, substantially as described.

810,086. FOLDING BED. JOHN H. CHATEN, Los Angeles, Cal. Filed Dec. 27, 1904. Serial No. 238,291.



Claim.—1. The combination of a wall-casing having a recess, a bed folding thereinto, a closure-door hinged at the sides of the recess and swinging rearwardly into said recess, counterweight means for the bed and connections from said counterweight means to said door to operate the same.

2. A wall-casing having a recess, a bed mounted to fold into said recess, doors hinged at the sides of the recess and swinging forwardly to close the recess, or rearwardly into the recess, said doors being provided with spring-hinges tending to close the same, and connections between the folding bed and the doors to turn the doors rearwardly into the recess when the bed is folded.

3. A wall-casing having a recess, a bed mounted to fold into said recess, doors hinged at the sides of the recess and swinging forwardly to close the recess or rearwardly into the recess to open the same, said doors being provided with spring-hinges tending to close the same, and connections between the folding bed and the doors to turn the doors rearwardly into the recess when the bed is folded, said connections comprising cords connected to the bed and to the doors and guiding-pulleys for said cords.

4. A wall-casing having a recess, a bed folding thereinto, counterweight devices comprising weights, suspending-cords connected thereto and to the bed, and pulleys over which said cords pass, folding doors closing the upper part of the recess and cords connected to said doors, and to the aforesaid cords to turn said doors rearwardly into the recess as the counterweights descend.

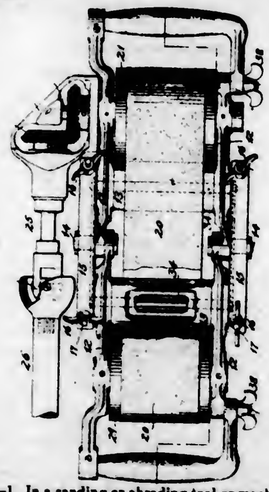
5. A wall-casing having a recess, a base-piece extending across the front of the recess and closing the bottom of said recess when the bed is down, male and female members being provided for removably holding said base-piece non-rotatably in position, and a folding bed pivotally mounted on said base-piece to fold into the recess.

6. A wall-casing having a recess, a base-piece extending across the front of the recess and provided with means for removably holding the same non-rotatively in position and a folding bed detachably mounted on said base-piece to fold into the recess.

7. A wall-casing having a recess, a bed folding thereinto and having a headboard closing the lower part of the recess when the bed is lowered, closure means hinged at the sides of the recess for closing the part of the recess above the said headboard and closure means hinged at the sides of the recess for closing the recess below the aforesaid closure means.

8. A wall-casing having a recess, a bed folding thereinto and having a headboard closing the lower part of the recess when the bed is lowered, closure means hinged at the sides of the recess for closing the part of the recess above the said headboard and closure means hinged at the sides of the recess for closing the recess below the aforesaid closure means, and latch means connecting the upper and lower closure means together.

810,037. SANDING AND POLISHING MACHINE. DE LASKI T. CLEMONS, Hornellsville, N. Y., assignor of two-thirds to J. Feytrenet and J. F. Richardson, Hornellsville, N. Y. Filed May 2, 1905. Serial No. 258,443.



Claim.—1. In a sanding or abrading tool or machine, the combination with a frame consisting of two parts having a yielding jointed connection, of a drum or roller mounted in each part of said frame, an endless abrading-belt passing about said drums or rollers, and power-operated means for driving one of said drums or rollers to operate said belt.

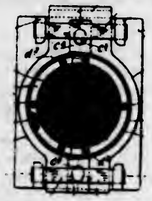
2. A power-operated sanding or abrading tool or machine, comprising a frame consisting of two parts having a jointed or pivoted connection, combined with springs serving to hold the two portions of said frame in approximate alinement with each other, a drum or roller mounted in each portion of the said jointed or pivoted frame, an endless belt passing around said drums or rollers, and power-operated means for driving one of said rollers.

3. A power-operated sanding or abrading tool or machine, comprising a frame consisting of two parts having a jointed or pivoted connection, combined with springs serving to hold the two portions of said frame in approximate alinement with each other, a drum or roller mounted in each portion of the said jointed or pivoted frame, an endless belt passing around said drums or rollers, and a pad connected with said frame and adapted to press upon the belt so as to hold the same against the surfaces to be sanded or polished.

4. In a sanding or abrading tool or machine, the combination with a frame, of drums or rollers, an endless abrading-belt passing about said drums or rollers, a shaft on which one of said drums or rollers is mounted, a bevel-gear on said shaft, a journal-box pivoted on said frame, and a driving-shaft journaled in said box and having a bevel-gear meshing with the first-named bevel-gear.

5. In a sanding or abrading tool or machine, the combination with a two-part frame having a yielding connection, of drums or rollers, an endless abrading-belt passing about said drums or rollers, a shaft on which one of said drums or rollers is mounted, a bevel-gear on said shaft, a journal-box pivoted on said frame, and a driving-shaft journaled in said box and having a bevel-gear meshing with the first-named bevel-gear.

810,038. DUST-GUARD. EDWARD DENEGRE, Chicago, Ill., assignor to McCord & Company, Chicago, Ill., a Corporation of New Jersey. Filed Jan. 6, 1904. Serial No. 187,165.

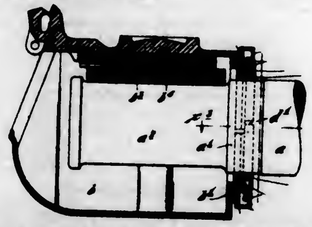


Claim.—1. The combination with a journal-box, of a guard-plate, a sectional packing-ring, and means for yieldingly clamping said parts to the box, the said guard-plate being interposed between the packing-ring and the box, and said packing-ring being removable, from the box independently of the guard-plate, substantially as described.

2. The combination with a journal-box, of a guard-plate, a sectional packing-ring seated in the outer face of the guard-plate, and means for yieldingly clamping said parts to the box, the said guard-plate being interposed between the packing-ring and the box, and said packing-ring being removable from the box independently of the guard-plate, substantially as described.

3. The combination with a journal-box, of a sectional guard-plate, a sectional packing-ring, and means for yieldingly clamping said parts to the box, the said guard-plate being interposed between said packing-ring and the box, and the said packing-ring being removable from the box independently of the guard-plate, whereby the packing-ring or the entire dust-guard can be removed at will, without the separation of the axle and the box, substantially as described.

810,039. DUST-GUARD. EDWARD DENEGRE, Chicago, Ill. Filed July 6, 1905. Serial No. 268,836.

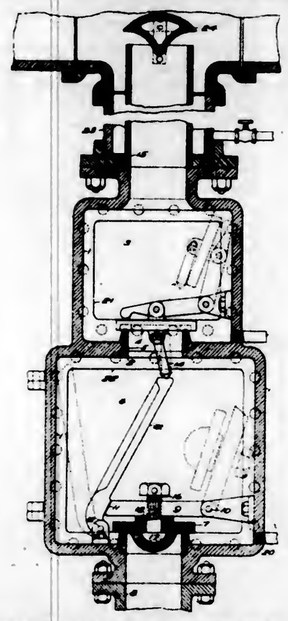


Claim.—1. The combination with a journal-box, of a guard-plate having means for detachable engagement with said box, a packing-ring interposed between said guard-plate and said box and directly engaging and packing both the axle and the box, which packing-ring is made up of a plurality of sections and is provided with a conical spring-engaging surface, and a spiral helical spring reacting at its large end against said detachable guard-plate and with its smaller end directly engaging and reacting against the conical surface of said packing-ring, substantially as described.

2. The combination with a journal-box, of a guard-plate having means for detachable engagement with said box, a packing-ring interposed between said guard-plate and said box and directly engaging and packing both the axle and the box, which packing-ring is made up of a plurality of loosely-connected sections having overlapped ends, said packing-ring having a conical spring-engaging surface, and a spiral helical spring reacting at its large end against said detachable guard-plate and with its smaller end directly engaging and reacting against the conical surface of said packing-ring, substantially as described.

810,040. AUTOMATIC VALVE FOR FIRE-EXTINGUISHERS. JOHN H. DORSEY, Brookline, Mass. Filed Nov. 7, 1902. Serial No. 130,290.

Claim.—1. An automatic valve for fire-extinguishers, having, in combination, a water-valve chamber, a water-supply pipe and a dry pipe connected therewith, a water-valve in the said chamber for closing the water-pipe against the pressure of the water, an air-valve between the dry pipe and the water-valve chamber for closing the dry pipe held closed by the air-pressure, and connections between the said valves for holding the water-valve closed including members provided with inclined friction-surfaces through which the force is transmitted from the air-valve to the water-valve, so that increased pressure on the water-valve is increasingly resisted by the friction between the said inclined surfaces, substantially as described.



2. An automatic valve for fire-extinguishers, having, in combination, a water-valve chamber, a water-supply pipe and a dry pipe connected therewith, a water-valve in the said chamber for closing the water-pipe against the pressure of the water, an air-valve between the dry pipe and the water-valve chamber, for closing the dry pipe, held closed by the air-pressure, and connections between the said valves for holding the water-valve closed, comprising a locking-lever engaging the water-valve to hold it closed, and a link connection between the lever and the air-valve, substantially as described.

3. An automatic valve for fire-extinguishers, having, in combination, a water-supply pipe, an air-pipe, a water-valve for closing the water-pipe against the pressure of the water, an air-valve between the dry pipe and the water-valve, for closing the air-pipe, held closed by the air-pressure, and connections between the two valves for holding the water-valve closed by the air-pressure, comprising a lever engaging the water-valve and a strut engaging the said lever and pivotally connected with the air-valve, substantially as described.

4. An automatic valve for fire-extinguishers, having, in combination, a water-valve chamber, a water-supply pipe and a dry pipe connected therewith, a water-valve in the said chamber for closing the water-pipe against the pressure of the water, an air-valve between the dry pipe and the water-valve, for closing the dry pipe, held closed by the air-pressure, and connections between the said valve for holding the water-valve closed, comprising a lever, the lever and water-valve having cooperating inclined surfaces, substantially as described.

5. An automatic valve for fire-extinguishers, having, in combination, a dry pipe, an air-valve, a water-pipe, a water-valve, automatic means for releasing the water-valve on a drop in pressure in the dry pipe, and a closed reservoir in communication with the dry pipe, the connection between the reservoir and the dry pipe being arranged to divert into the reservoir water returning from the dry-pipe system, so as to prevent the formation of a water column above the air-valve, substantially as described.

6. An automatic valve for fire-extinguishers, having, in combination, a dry pipe, an air-valve, a water-pipe, a water-valve, automatic means for releasing the water-valve on a drop in pressure in the dry pipe, an annular reservoir surrounding a vertical part of the dry pipe, an opening between the top of the reservoir and the dry pipe, and means for diverting into said opening any water returning from the dry-pipe system, substantially as described.

7. An automatic valve for fire-extinguishers, having, in combination, a water-supply pipe, a dry pipe, a water-valve for closing the water-pipe against the pressure of the water, an air-valve for closing the dry pipe, a pivoted arm to which the dry-pipe valve is attached, a locking-lever engaging the water-valve, and a strut connecting the locking-lever and the air-valve, the strut being inclined to the air-valve, substantially as described.

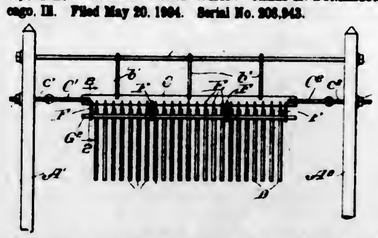
8. An automatic valve for fire-extinguishers, having, in combination, a water-supply pipe, a valve for holding it closed against the pressure of the water, a dry pipe, an air-valve for closing the dry pipe held closed by the air-pressure, a locking-lever pivoted to the valve-casing and engaging at an intermediate point a surface connected to the water-valve, and a strut engaging the free end of the said lever and the said air-valve, substantially as described.

9. An automatic valve for fire-extinguishers, having, in combination, a water-supply pipe, a water-valve for holding it closed against the pressure of the water, a dry pipe, an air-valve between the dry pipe and the water-valve for closing the dry pipe, held closed by the air-pressure, a locking-lever pivoted to the valve-casing near the water-valve seat, the said lever being inclined to the plane of the water-valve, and a strut engaging the air-valve and the said lever, substantially as described.

10. An automatic valve for fire-extinguishers, having, in combination, a water-supply pipe, a water-valve for holding it closed against the pressure of the water, a dry pipe, an air-valve between the dry pipe and the water-valve for closing the dry pipe, held closed by the air-pressure, a locking-lever pivoted to the valve-casing and engaging the water-valve, and a strut connecting the locking-lever and the air-valve, the said lever and strut being inclined to the said valves and to each other, substantially as described.

11. An automatic valve for fire-extinguishers, having, in combination, a casing provided with an inlet-port and an outlet-port for water, the ports being substantially in line with each other, a water-valve for closing the inlet-port against the pressure of the water, an air-valve for closing the outlet-port held closed by air-pressure, and a mechanism interposed between the valves for holding the water-valve in its closed position until the air-pressure upon the air-valve is relieved, the said mechanism including opposed inclined friction-surfaces and the valves and mechanism assuming, when the valves are open, a position out of line with the ports so as to form an unobstructed passage between them, substantially as described.

810,041. BRIDGE-GUARD WHIP. JAMES H. DONALDSON, Chicago, Ill. Filed May 20, 1904. Serial No. 208,943.



Claim.—1. In a bridge-guard whip, the combination with a transverse support, of a plurality of rods depending from said support, and means preventing the movement of said rods relatively to said support by the wind.

2. In a bridge-guard whip, the combination with a transverse support, of a plurality of rods depending from said support, and transverse bars located on either side of said rods adjacent their upper ends to prevent said rods being swung relatively to the transverse support by the wind.

3. In a bridge-guard whip, the combination with a transverse support, of a plurality of rods depending from said support, hangers depending from said support on opposite sides of said rods, and transverse bars supported by said hangers adjacent the upper ends of the rods.

4. In a bridge-guard whip, the combination with a transverse support, a plurality of ratan rods pivotally secured to said support at their upper ends, and means for preventing said rods being swung relatively to said support by the wind.

5. In a bridge-guard whip, the combination with a pair of posts

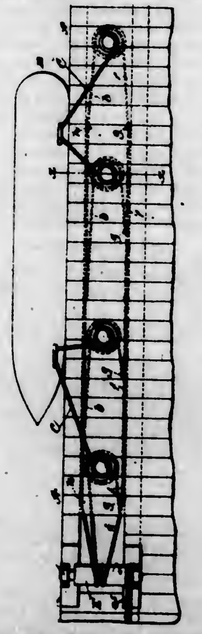
5. In a bridge-guard whip, the combination with a pair of posts one located at each side of a railroad-track, of a transverse rod supported at its opposite ends near the upper ends of said posts, a transverse strip suspended by said rod, tie-rods uniting the ends of said strip to the posts, and a plurality of rods depending from said strips.

6. In a bridge-guard whip, the combination with a pair of posts one located at each side of a railroad-track, of a transverse rod supported at its opposite ends near the upper ends of said posts, a transverse strip suspended by said rod, tie-rods uniting the ends of said strip to the posts, a plurality of rods depending from said strip, and means for preventing the movement of said rods relatively to said strip by the wind.

7. In a bridge-guard whip, the combination with a pair of posts one located at each side of a railroad-track, of a transverse rod supported at its opposite ends near the upper ends of said posts, a transverse strip suspended by said rod, tie-rods uniting the ends of said strip to the posts, a plurality of rods depending from said strip, and transverse bars located on either side of said rods adjacent their upper ends to prevent them from being swung relatively to said strip by the wind.

8. In a bridge-guard whip, the combination with a pair of posts one located at each side of a railroad-track, of a transverse rod supported at its opposite ends near the upper ends of said posts, a transverse strip suspended by said rod, tie-rods uniting the ends of said strip to the posts, a plurality of rods depending from said strip, hangers depending from said strip and extending downwardly to opposite sides of said rods, and transverse bars supported by said hangers adjacent the upper ends of the rods.

810,042. **MOORING DEVICE.** WILLIAM D. DUNCAN, Boston, Mass. Filed May 6, 1905. Serial No. 259,134.



Claim.—1. A mooring device adapted to be sustained on a wharf or dock and having connected therewith one end of a hawser led out from a vessel, and flexible means for turning said mooring device to release the hawser therefrom.

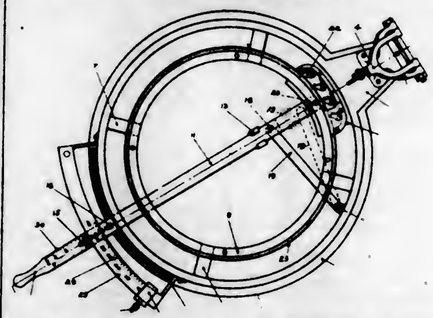
2. A mooring device adapted to be mounted on a wharf or dock, and provided with a horn or projection, combined with means for partially rotating said device.

3. A mooring device adapted to have connected therewith one end of hawser, and means to revolve said mooring device to discharge said hawser.

4. A mooring device provided with a drum and adapted to have one end of a hawser connected therewith, combined with a cable connected with said drum, and means to move said cable, said cable when moved causing the mooring device to disengage itself from the hawser.

5. A plurality of mooring devices, adapted to be mounted on a wharf or dock, and provided with a horn or projection, combined with flexible means leading to said mooring devices for revolving the same simultaneously to release a vessel.

810,043. **CHEESE-CUTTER.** FRANK P. DUNN, Anderson, Ind., assignor to Simpson Computing Scale Company, Elkhart, Ind., a Corporation. Filed Mar. 28, 1904. Serial No. 200,306.



Claim.—1. In a cheese-cutter, the combination of a rotary cheese-plate, an extensible lever comprising telescoping sections for rotating the plate, a clutch connection between the lever and plate, and an adjustable fulcrum for the lever operated by the telescopic movement of the lever-sections.

2. In a cheese-cutter, the combination of a rotary cheese-plate, an extensible operating-lever, a clutch between the plate and lever, an adjustable fulcrum for the lever operated by the movement of one part of the lever, and price-indicating marks on the lever.

3. In a cheese-cutter, a movable plate an extensible operating-lever therefor, a movable fulcrum for the lever, operated by the movement of one part of the lever and means for locking the lever at its points of extension.

4. In a cheese-cutter, the combination of a frame, a rotary cheese-plate, a lever for rotating the same, a clutch between the lever and plate, a fulcrum for the lever, and a link on which the fulcrum is supported, said link being pivoted on the frame, and said lever being formed in sections, whereby said fulcrum may be adjusted.

5. In a cheese-cutter, the combination of a rotary cheese-plate, of an extensible lever for operating the same, a clutch between the lever and plate, an adjustable fulcrum for the lever, and means for adjusting the fulcrum by the adjustment of the lever.

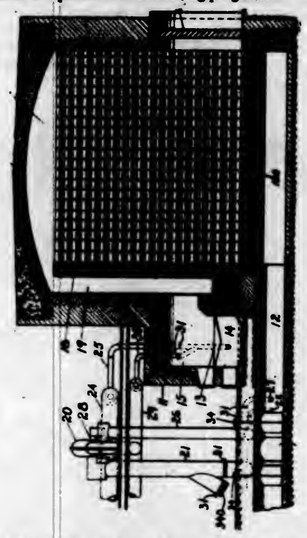
6. In a cheese-cutter, the combination of a frame, a rotary cheese-plate, a lever for operating the same comprising an upper and a lower section slidingly engaged together, a fulcrum on the lower section, a link extending from the fulcrum to a stationary pivot on the frame, a clutch between the upper section of the lever and the plate, a stationary segment on the frame having weight indications thereon, an adjustable stop on the segment, price indications on the lever adjacent to the segment, and means for securing the two sections of the lever together at various points of adjustment.

810,044. **PROCESS OF BURNING CERAMIC WARE.** BYRON E. BLOOMS, Brooklyn, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Feb. 21, 1905. Serial No. 246,669.

Claim.—1. The process of burning ceramic ware which consists in subjecting a penetrable mass of said ware to a voluminous slow-burning flame produced by passing through a bed of solid fuel an artificially-accelerated draft-current containing free oxygen and diluent neutral products of combustion in predetermined proportions, and increasing the proportion of the diluent as the high temperature zone of the ware extends.

2. The process of burning ceramic ware which consists in subjecting the ware to a voluminous slow-burning flame produced with a dilute air-draft, and varying the composition of said draft in accordance with the temperature attained by the ware.

3. The process of burning ceramic ware which consists in causing a flame of artificially-retarded combustion to penetrate a mass of the ware under forced draft, and elongating the flame by a predetermined variation in its composition as the burning progresses.



4. The process of burning ceramic ware which consists in subjecting the ware to a voluminous slow-burning flame produced with an artificially-strengthened air-draft containing products of combustion in predetermined proportion, and increasing the force of said draft as the high-temperature zone extends.

5. The process of burning ceramic ware which consists in projecting a flame from a fuel-bed with an artificially-forced draft-current containing products of combustion in sufficient amount to suppress the natural intensity of combustion, causing said frame to penetrate the ware, and increasing the proportion of said products in the draft-current as the temperature of the ware increases.

6. The process of burning ceramic ware which consists in projecting a flame from a fuel-bed with an artificially-forced draft-current containing products of combustion in sufficient amount to suppress the natural intensity of combustion, causing said flame to penetrate the ware, and increasing the force of the draft-current as the zone of high temperature extends.

7. The process of burning ceramic ware which consists in projecting from a fuel-bed into a penetrable mass of the ware a flame produced with an artificially-strengthened draft-current containing products of combustion in sufficient amount to retard the combustion of and inflate said flame, and regulating the composition of the flame with reference to the condition of the ware.

8. The process of burning ceramic ware which consists in producing a voluminous slow-burning flame with a predetermined proportion of products of combustion in the draft-current supplied to the fire, applying said flame under artificially-strengthened draft to a stationary mass of ceramic ware, and maintaining it in operation with the increasing flame volume from the time the ware loses its water and reaches an ignition-sustaining condition until it is completely burned.

9. The process of burning ceramic ware which consists in projecting from a fuel-bed into a mass of the ware, a voluminous slow-burning flame produced with products of combustion and free oxygen in predetermined proportion in the draft-current, and alternately increasing and decreasing the proportion of products to produce alternations of reducing and oxidizing quality in the flame.

10. The process of burning ceramic ware which consists in driving off the water from the green ware with a low-temperature heating agent, and then when the ware has reached a condition capable of sustaining ignition, subjecting it to a voluminous slow-burning flame produced with a predetermined proportion of products of combustion in the draft-current supplied to the fire, increasing the volume of said flame as burning proceeds.

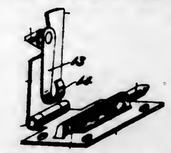
11. The process of burning ceramic ware which consists in subjecting the ware in a kiln-chamber to a voluminous flame of artificially-retarded combustion produced with products of combustion and air in the draft-current supplied to the fire, and preheating the air by the heat from burned ware in a different kiln-chamber.

12. The process of treating ceramic ware which consists in subjecting it to the heat of a flaming fuel-bed through which is passed a predetermined proportion of products of combustion, and subjecting the flame to the igniting influence of a refractory heat-retainer in advance of the ware until the major part of its combustion is completed.

13. The process of burning ceramic ware which consists in diluting and dilating fire-gases with products of combustion and with air in such relative proportions as to give a tardily-burning mixture, passing such mixture through a hot-walled ignition-flue, thoroughly admixing the gases and inaugurating combustion therein, and continuing the combustion in immediate proximity to the ware to be burned.

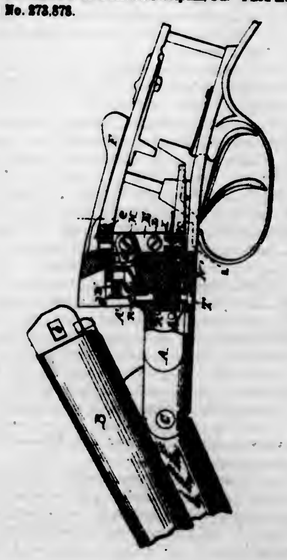
14. The process of burning ceramic ware which consists in burning a penetrable mass of such ware in a kiln with a gradually-elongating flame.

810,045. **WINDOW-LOCK.** ELIAS STEINBOUSER and ROSANNAH L. MORRIS, San Jose, Cal. Filed Feb. 27, 1905. Serial No. 247,464.



Claim.—A sash-fastener having in combination two flat plates hinged together along their meeting edges one of said plates adapted to be fixedly secured on the top rail of the lower sash and having a housing which extends parallel with the hinge of said plates said housing having a closed rear end and a longitudinally-extending slot offset at the front end, a spring in the rear portion of the housing, a bolt slidable in the housing and normally projected by the spring, said bolt having a knob operable in the slot of the housing, a turnable bolt mounted in the other plate said bolt having a conically-shaped head and lateral wings or projections, and a handle-piece by which the bolt is turnable, a plate adapted to be secured to the upper sash having keyhole-slots engageable by the head and wings of the turnable bolt, and a plate adapted to be secured to the window-casing having openings engageable by the spring-actuated locking-bolt.

810,046. **BARREL-LOCKING DEVICE FOR BREAKDOWN GUNS.** ASHLEY H. FOX, Philadelphia, Pa. Filed Aug. 12, 1905. Serial No. 273,878.



Claim.—1. In a breech-loading breakdown gun the breech-frame having a hole, combined with a locking-bolt arranged in the breech-frame for locking the barrels, an upright spindle journaled in the breech-frame and having a lateral arm terminating in a ball-shaped head, a spring located in the hole in the breech-frame, a follower resting against the spring and having a diameter less than the diameter of the hole so as to form a clearance-space between it and the hole and also provided on its outer end with a concave recess into which the ball-shaped head of the lateral arm is received, and a connection between the spindle and the locking-bolt whereby the latter may be operated by rocking the spindle.

2. In a breech-loading breakdown gun, the breech-frame having a hole, combined with a cylindrical rotary locking-bolt opened in the breech-frame in line with its center for locking the barrels, an upright spindle journaled in the breech-frame and having a spring, a lateral arm terminating in a ball-shaped head, a spring located in the hole in the breech-frame, a follower resting against the spring and having a diameter less than the diameter of the hole so as to form a clearance-space between it and the hole and also provided on its outer end with a concave recess into which the ball-shaped head of the lateral arm is received, and a connection between the spindle and the locking-bolt consisting of a pendulum-lever having a ball-shaped head extending into the body of the rotary locking-bolt and contacting therewith only at its cylindrical head whereby it may be operated by rocking the spindle.

3. In a breech-loading breakdown gun, the combination of the barrels, a rotary locking-bolt revolving on an axis substantially parallel to the axis of the bore of the barrel and having an oblique hole D′, a rocking spindle having a hand-lever by which to rock it, spring devices to normally rock the spindle when the pressure on the hand-lever is released, and a pendulum-lever G hinged to the vertical rocking spindle on a transverse axis and provided on its end with a ball-shaped head G′ which fits into the oblique aperture in the locking-bolt whereby the bolt is given a rotary motion and contact between the pendulum-lever and the walls of the hole in the locking-bolt is prevented except adjacent to the ball-shaped head.

4. In a breech-loading breakdown gun the breech-frame combined with a rotary locking-bolt rotating on an axis substantially parallel to the axis of the barrels, a rocking spindle journaled in the breech-frame to the rear of the locking-bolt, and a pendulum-lever hinged to the rocking spindle and forming a ball-and-socket connection with the rotary locking bolt.

5. In a breech-loading breakdown gun, the combination of the breech-frame, a locking-bolt for the barrels carried by the breech-frame, an upright rocking spindle having a hand-lever and journaled in the breech-frame and also having a lateral-extending arm terminating in a ball-shaped head, a coil-spring carried by the breech-frame, a follower resting against the coil-spring at one end and having the other end recessed to receive the cylindrical-shaped head of the lateral arm of the spindle, and connections between the rocking spindle and the locking-bolt.

6. In a breech-loading breakdown gun, the breech-frame having a hole S extending upwardly from the bottom, in combination with a rotary cylindrical locking-bolt arranged in the breech-frame, spring-controlled means for rotating the locking-bolt, a trip R arranged in the hole adapted to lock the locking-bolt in open position, a coil-spring R′ adapted to press the trip upward also arranged in the hole and removable together with the trip downward through the bottom of the hole in the breech-frame, and means for closing the lower part of the hole in the breech-frame for holding the said spring and trip within the said hole and putting the spring under tension.

7. In a breech-loading breakdown gun, the breech-frame having a hole S extending upwardly from the bottom, in combination with a rotary cylindrical locking-bolt arranged in the breech-frame, spring-controlled means for rotating the locking-bolt, a trip R arranged in the hole adapted to lock the locking-bolt in open position, a coil-spring R′ adapted to press the trip upward also arranged in the hole and removable together with the trip downward through the hole in the breech-frame, a trigger-plate fitting against the lower part of the breech-frame, and means for closing the lower part of the hole in the breech-frame for holding the said spring and trip within the said hole and putting the spring under tension consisting of a screw T extending through the trigger-plate and screwed into the lower part of the hole S.

8. In a breech-loading breakdown gun, the combination of a rotary locking-bolt, spring-actuated means for rotating the bolt to lock the barrels, a trip to lock the locking-bolt in its open position, a spring to move the trip into locking position, a breech-frame inclosing the rotary locking-bolt and having an aperture of a diameter larger than the diameter of the trip and spring and open entirely through to the bottom, and removable means for sealing the bottom of the said aperture and applying a pressure to the spring to create an upward thrust upon the trip.

810,047. **PLUMBING SYSTEM.** JOHN L. PRUIN, New York, N. Y. Filed Oct. 17, 1904. Serial No. 228,740.

Claim.—A plumbing system composed of a main vent-pipe and a main waste-pipe extending from floor to floor of a building, a combination receiving-T located in said main waste-pipe and adapted to receive the discharge of a number of washbasins, closet-bowls, sinks, and bath-tubs, and vent the same individually, and a multifold interconnecting fitting which connects said T with said main vent-pipe at a substantially higher level between said floors whereby said individual venting is accomplished.

810,048. **MACHINE FOR MAKING COIL-SPRINGS.** JOHN F. GAIL, Kenosha, Wis., assignor to The Simmons Manufacturing Company, Kenosha, Wis., a Corporation of Wisconsin. Filed Mar. 3, 1904. Serial No. 196,494.

Claim.—1. The combination of coiling mechanism; a press; and means provided with a coil-gripping device and serving to convey coils from the coiling mechanism to the press.

2. The combination of coiling mechanism; a press; knotting mechanism; and means for conveying coils from the coiling mechanism to the press and from the press to the knotting mechanism.

3. The combination of coiling mechanism; a press; knotting mechanism; nesting mechanism; and means for transferring coils progressively through the machine.

4. The combination of coiling mechanism; a press; and an oscillating carrier operating to transfer coils from the coiling mechanism to the press.

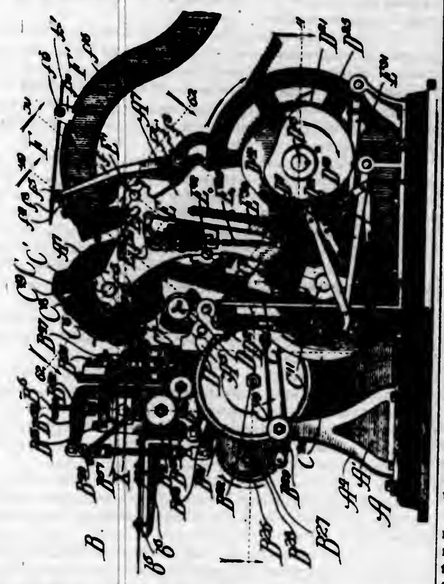
5. The combination of coiling mechanism; a press; and a carrier provided with means for simultaneously removing coils from the coiling mechanism and the press.

6. The combination of coiling mechanism; a press; and an oscillating carrier provided with means for simultaneously conveying coils from the coiling mechanism and the press.

7. The combination of coiling mechanism; a press; and a swinging carrier provided with two pair of jaws spaced to receive coils from the coiling mechanism and the press.

8. The combination of coiling mechanism; a press; knotting mechanism; and a suitably-actuated carrier provided with coil-engaging means corresponding with each of said named mechanisms and located adjacent thereto in one position of said carrier, for the purpose set forth.

9. The combination of coiling mechanism; a press; knotting mechanism; nesting mechanism; and an oscillating carrier provided with suitably-spaced coil-engaging means and operating to simultaneously transfer the coils from the point wherein they are being operated upon respectively to the next succeeding points of operation, for the purpose set forth.



10. The combination of coiling mechanism; a press; knotting mechanism; nesting mechanism; said mechanism being arranged in a curved path, and a pivotally-supported carrier equipped with a plurality of pairs of jaws adapted to oscillate between adjacent mechanisms, for the purpose set forth.

11. The combination of coiling mechanism; a press; knotting mechanism provided with gripping devices and suitable knotters, the discharge-point of the coiling mechanism, the press, and the gripping devices of the knotting mechanism being arranged on a curve, an oscillating carrier provided with a plurality of properly-spaced coil-engaging means, and means for moving the gripping devices of the knotting mechanism with relation to the knotters, for the purpose set forth.

12. The combination of coiling mechanism; a press, located in the rear of the coiling mechanism and having its axis substantially parallel with the axis of the coil formed in the coiling mechanism; and means equipped with a coil-gripping device and serving to transfer the coil parallel with itself from the coiling mechanism to the press.

13. The combination of coiling mechanism; a press; and an oscillating carrier provided with means for gripping the coil at an intermediate portion, said carrier operating to transfer coils from the coiling mechanism to the press.

14. The combination of coiling mechanism; a press; an oscillating carrier, and a pair of coil-gripping jaws forming a part of said carrier and operating to transfer coils from the coiling mechanism to the press.

15. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire through said bending means, said wire-bending means operating to form the coil and project it at right angles to the path of the entering wire; a press having its axis parallel with the coil when formed; and a coil-transferrer provided with coil-gripping means and serving to move the coil to and position the same for the press, for the purpose set forth.

16. The combination of coiling mechanism; a press comprising a pair of presser-heads equipped with fingers for entering the coils and provided with perforations for receiving the opposite fingers, respectively, and means for transferring the coils from the coiling mechanism to the press.

17. The combination of coiling mechanism; a press having a reciprocating member provided with a finger for entering the coil; and a swinging carrier provided with a pair of coil-gripping jaws having a range of movement from the coiling mechanism to the path of the reciprocating member of the press.

18. The combination of coiling mechanism; a press; coil-rotating means coacting with the press; and a carrier serving to transfer coils from the coiling mechanism to the press.

19. The combination of coiling mechanism; a press comprising reciprocating presser-heads; coil-rotating devices coacting with said presser-heads; and a carrier serving to transfer coils from the coiling mechanism to the press.

20. The combination of coiling mechanism; a press comprising reciprocating presser-heads; coil-rotating members having a pivotal movement with relation to said presser-heads and also a movement of reciprocation with the presser-heads; and means for transferring the coils from the coiling mechanism to the press.

21. The combination of coiling mechanism; a press comprising reciprocating presser-heads mounted on guides, one of said guides being rotatable; coil-rotating members rotatably connected with said presser-heads and having a movement of reciprocation therewith; actuating means for said coil-rotating members operated through the medium of said rotatable guide; and coil-transferring means, for the purpose set forth.

22. The combination of coiling mechanism; a press having reciprocating presser-heads equipped with coil-entering fingers; knotting mechanism; and a carrier equipped with a front pair of gripping-jaws and a pair of gripping-jaws in the rear thereof; actuating means for the first-named pair of jaws; and actuating means for the second-named jaws operating to close the same prior to the closure of the first-named pair of jaws, for the purpose set forth.

23. The combination of coiling mechanism; a press comprising reciprocating presser-heads equipped with coil-entering fingers, coil-rotating devices moving reciprocatingly with said heads and rotatably mounted with relation thereto; knotting mechanism; and coil-transferring means, for the purpose set forth.

24. The combination of coiling mechanism; a press comprising reciprocating presser-heads equipped with coil-entering fingers, coil-rotating devices moving reciprocatingly with said heads and rotatably mounted with relation thereto; knotting mechanism; coil-transferring means, comprising a carrier equipped with suitably-spaced pairs of jaws serving to receive intermediate portions of the springs; and actuating means for the jaws.

25. The combination of coiling mechanism; a press; knotting mechanism provided with transversely-reciprocating longitudinally-oscillating gripping devices and knotters located a short distance from the normally advanced positions of the gripping devices, and a carrier provided with means for moving the coils progressively through the machine.

26. The combination of coiling mechanism; a press; knotting mechanism provided with reciprocating swinging gripping devices and with knotters removed somewhat from the paths of reciprocation of the gripping devices, gages coacting with said gripping devices to measure the lengths of the projections employed in making the knots; and a carrier provided with suitable coil-engaging means and operating to move the coils progressively through the machine.

27. The combination of coiling mechanism; a press; knotting mechanism; and an intermittently-actuated carrier provided with a plurality of gripping devices and serving to move the coils step by step through the machine.

28. The combination of coiling mechanism; a press; knotting mechanism provided with coil-gripping means and with means coacting therewith to measure the length of a projection to be employed in making a knot; and coil-transferring means operating to move the coils progressively through the machine.

29. The combination of coiling mechanism; a press; coil-rotating means coacting with said press; knotting mechanism provided with coil-gripping devices and means coacting therewith for measuring the length of a projection to be employed in making a knot; and coil-transferring means serving to move the coils progressively through the machine.

30. The combination of coiling mechanism; a press; a rotating shaft; a swinging coil-carrier provided with jaws, and cams on said shaft serving to actuate said jaws.

31. The combination of mechanisms for forming and operating upon a coil; and a coil-carrier comprising spring-closed jaws and cams for opening said jaws.

32. The combinations of mechanisms for forming and operating upon coils; a rotating shaft; a coil-carrier swinging thereon; a plurality of pairs of spring-closed jaws forming a part of said carrier and

suitably spaced with relation to said mechanisms; and cams on said

suitably spaced with relation to said mechanisms; and cams on said shaft for opening said jaws.

33. The combination of coiling mechanism; a press; knotting mechanism comprising suitable knotters and reciprocating gripping devices having a movement of rotation, when at the inner ends of their traverses, to carry the coil to and from the knotters; and a carrier serving to move the coils progressively through the machine.

34. In a machine of the character described, the combination of a press; knotting mechanism; and a carrier serving to transfer the coils from the press to the knotting mechanism.

35. In a machine of the character described, the combination of a press; knotting mechanism; and a carrier provided with a plurality of pairs of jaws serving simultaneously to transfer coils to and from the press and the knotting mechanism.

36. In a machine of the character described, the combination of a press having a reciprocating member; knotting mechanism; and an oscillating carrier provided with three pairs of jaws, one pair of jaws serving to transfer the coil to the press, another pair serving to transfer the coil from the press to the knotting mechanism, and the third pair serving to transfer the coil away from the knotting mechanism.

37. In a machine of the character described, the combination of a press provided with reciprocating presser-heads having inward extensions adapted to enter a coil; knotting mechanism comprising suitable knotters and reciprocating gripping devices having an oscillating movement to transfer the coil to and from the knotters; and an oscillating carrier provided with a plurality of pairs of jaws and serving to move the coils progressively through the machine.

38. In a machine of the character described, the combination of a press provided with reciprocating presser-heads; coil-rotating devices rotatively mounted with relation to said presser-heads; a rock-shaft equipped with gear-segments serving to actuate the coil-rotating devices; knotting mechanism equipped with suitable knotters and with gripping devices operating to carry the coil to and from the knotters; and a carrier provided with a plurality of coil-engaging devices and operating to transfer coils to and from the press and to and from the gripping devices of the knotting mechanism.

39. In a machine of the character described, the combination of a press; knotting mechanism provided with suitable knotters and gripping devices; and an oscillating pivoted carrier provided with a plurality of pairs of coil-gripping jaws, for the purpose set forth.

40. In a machine of the character described, the combination of a press; knotting mechanism; nesting mechanism; and a carrier serving to move the coils progressively through the machine.

41. In a machine of the character described, the combination of a press; knotting mechanism equipped with suitable knotters and with gripping devices serving to carry the coil to and from the knotters; nesting mechanism; and an oscillating carrier provided with a plurality of pairs of jaws operating to transfer coils to and from the press, to and from the gripping devices of the knotting mechanism, and to the nesting mechanism.

42. In a machine of the character described, the combination of a press; knotting mechanism; nesting mechanism comprising a receiver and a nester; and a carrier serving to move the coils progressively till they come within the grasp of the nester, for the purpose set forth.

43. In a machine of the character described, the combination of knotting mechanism; nesting mechanism; and means for transferring coils from the knotting mechanism to the nesting mechanism.

44. In a machine of the character described, the combination of knotting mechanism equipped with a suitable knotter and coil-gripping means serving to transfer the coils to and from the knotter; nesting mechanism comprising a suitable receiver and an oscillating nester; and a carrier provided with means for transferring coils to and from the gripping means of the knotting mechanism and to the nester of the nesting mechanism.

45. In a machine of the character described, the combination of knotting mechanism comprising knotting-pinions, gears meshing therewith, shafts for said gears equipped at their lower ends with cam-engaging gears, cam-wheels engaging said last-named gears, and gripping devices serving to carry the coil to and from the knotting-pinions; nesting mechanism; and a carrier serving to transfer coils from the gripping devices of the knotting mechanism to the nesting mechanism.

46. In a machine of the character described, the combination of knotting mechanism; nesting mechanism comprising a receiver provided with an opening having flaring walls and a nester serving to advance the coils from the contracted portion of the receiver; and a carrier serving to transfer coils from the knotting mechanism into the contracted portion of the receiver.

47. In a machine of the character described, the combination of a press; coil-rotating means operatively connected with said press; knotting mechanism comprising a suitable knotter and gripping means for carrying the coils to and from the knotter, a gage operatively mounted with relation to said gripping means and serving to regulate the length of the projection of the wire to be employed in making the knot; and a carrier serving to move the coils progressively through the machine.

48. In a machine of the character described, the combination of a press; a coil-rotating device operatively mounted with relation thereto; knotting mechanism comprising suitable knotters and reciprocating gripping devices having an oscillating movement at the inner ends of their traverses; and gages operatively mounted with relation to said gripping devices; and a carrier serving to move the coils progressively through the machine.

49. In a machine of the character described, the combination of a press; a coil-rotating device operatively mounted with relation thereto; knotting mechanism comprising suitable knotters; reciprocating gripping devices having an oscillatig movement at the inner ends of their traverses; and gages operatively mounted with relation to said gripping devices; nesting mechanism; and a carrier provided with means for transferring coils to and from the press, to and from the gripping devices of the knotting mechanism, and to the nesting mechanism.

50. The combination of mechanisms for coiling, and operating upon springs; nesting mechanism; and means for transferring the coils progressively through the machine.

51. The combination of coiling mechanism; knotting mechanism independent thereof; and means for transferring coils from the coiling mechanism to the knotting mechanism.

52. The combination of coiling mechanism; knotting mechanism; nesting mechanism; and means for transferring coils progressively through the machine.

53. In a machine of the character described, the combination of mechanism for operating upon a coil-spring; nesting mechanism; and an oscillating carrier serving to deliver springs to the nesting mechanism.

54. In a machine of the character described, the combination of mechanism for operating upon coil-springs; nesting mechanism comprising a receiving-chute, and a nester coacting therewith; and means for moving the springs progressively through the machine to a point within reach of the nester.

55. In a machine of the character described, the combination of mechanism for operating upon coil-springs; nesting mechanism comprising a receiving-chute having a contracted portion and a nester operating to move the springs along said chute; and an oscillating carrier serving to move the springs progressively through the machine and deposit them within the contracted portion of said receiving-chute.

56. In a machine of the character described, the combination of mechanism for operating on coil-springs; nesting mechanism comprising a receiving-chute having a flaring opening for admission of springs, and a nester operating to move the springs along said chute; and an oscillating carrier provided with a pair of jaws serving to grasp each spring at an intermediate portion and carry the same into said flaring opening of the receiver and deposit the same within reach of the nester.

57. In a machine of the character described, the combination of mechanism for operating upon coil-springs; nesting mechanism comprising a receiver provided at its receiving end with means for retaining a spring and a nester coacting with said receiver; and an oscillating carrier provided with jaws serving to deposit the springs successively within grasp of the retaining means of said receiver.

58. In a machine of the character described, the combination of mechanism for operating upon coil-springs; means for transferring the springs from said mechanism; and nesting mechanism comprising a receiving-chute and an oscillating nester having a depressible hook serving to engage the springs as they are successively deposited within the receiving end of the receiver and convey the same along the receiver.

59. In a machine of the character described, the combination of mechanism for operating upon coil-springs of a given length; and nesting mechanism comprising a receiving-chute having walls holding the springs compressed and a nester provided with a depressible hook serving to engage the springs at the receiving end of the receiver and transfer them along the receiver.

60. In a machine of the character described, the combination of mechanism for operating upon coil-springs; and nesting mechanism comprising a receiving-chute having a contracted receiving end, an oscillating nester serving to move the springs along the receiver, and projections extending from the contracted portion of the receiver into the adjacent portion of the receiver and serving to direct the end rings of the entering coil-spring into the spaces provided therefor in the nested springs for the purpose set forth.

61. In a machine of the character described, the combination of a swinging coil-carrier provided with a pair of jaws; and nesting mechanism comprising a receiving-chute having a contracted front end provided with flaring downward extensions, the front end of the receiver being open to allow said jaws to swing to their elevated position; and an oscillating nester, for the purpose set forth.

62. In a machine of the character described, the combination of a swinging coil-carrier provided with a pair of jaws; and nesting mechanism comprising a receiving-chute having a contracted front end provided with flaring downward extensions, the front end of the receiver being open to allow said jaws to swing to their elevated position; and an oscillating nester equipped with a depressible hook, for the purpose set forth.

63. In a machine of the character described, the combination of a swinging coil-carrier provided with a pair of jaws; and nesting mechanism comprising a receiving-chute having a contracted front end provided with flaring downward extensions, the front end of the receiver being open to allow said jaws to swing to their elevated position; and an oscillating nester equipped with a depressible hook provided with an actuating-arm, and a friction-rod connected with said arm.

64. In a machine of the character described, the combination of knotting mechanism equipped with a suitable knotter, and provided with a transversely-reciprocating longitudinally-oscillating gripping device, and provided with a gage comprising a transversely-reciprocating slide and a revoluble gage-head connected therewith, the gripping device serving to carry the end ring of the spring to the knotter; nesting mechanism; and means for transferring coils from the knotting mechanism to the nesting mechanism.

65. In a machine of the character described, the combination of knotting mechanism comprising a pair of transversely-reciprocating longitudinally-oscillating gripping devices, a pair of reciprocating revoluble gages coacting with said gripping devices and serving to adjust the positions of the ends of the spring with relation to the adjacent clamping members of the gripping devices, and suitably-actuated knotters into which the end rings of the spring are carried in the oscillation of the gripping devices; nesting mechanism; and a carrier provided with a plurality of pairs of jaws, one pair serving to deliver springs to the gripping devices of the knotting mechanism, and another pair serving to receive springs from said gripping devices and transfer them to the nesting mechanism.

66. The combination of coiling mechanism; knotting mechanism; nesting mechanism; and a carrier serving to transfer the coils parallel with themselves, in a longitudinal plane, progressively, to the nesting mechanism.

67. The combination of coiling mechanism; a press; knotting mechanism; nesting mechanism; and an intermittently-actuated swinging carrier provided with three pairs of jaws arranged in a longitudinal plane and serving to move the coils progressively to the nesting mechanism.

68. The combination of coiling mechanism serving to form a transversely-extending coil, a press located in the rear of and beneath the point of formation of the coils; knotting mechanism provided with transversely-reciprocating longitudinally-oscillating gripping devices located in the rear of and somewhat above the press; nesting mechanism having the receiving end located in the rear of and somewhat above the gripping devices of the knotting mechanism; and an intermittently-actuated swinging carrier provided with a plurality of pairs of jaws arranged on a curve in a longitudinal plane, for the purpose set forth.

69. In a machine of the character described, the combination of coiling mechanism adapted to produce a transversely-extending coil; a press comprising transversely-reciprocating presser-heads adapted to approach near to the longitudinal central plane of the machine; knotting mechanism comprising suitable knotters and transversely-reciprocating longitudinally-oscillating gripping devices adapted to approach near to the longitudinal central plane of the machine before swinging; nesting mechanism having a receiving end located above and in the rear of said gripping devices, assuming the latter to be at the inner ends of their traverses and in their normally advanced position, a rotating shaft located above said press, an intermittently-actuated carrier having its axis concentric with said shaft and provided with a plurality of pairs of jaws, cams on said shaft for actuating the jaws, cams on said shaft for swinging one of said gripping devices of the knotting mechanism, and suitably-actuated cams for swinging the other gripping device of the knotting mechanism.

70. The combination of coiling mechanism for forming a transversely-extending coil; a press comprising reciprocating presser-heads; knotting mechanism comprising suitable knotters and transversely-reciprocating longitudinally-oscillating gripping devices; nesting mechanism provided with an oscillating nester, a rotating shaft in the rear of and below the knotting mechanism and equipped with cams for actuating the knotters, a cam for oscillating the nester, and cams for reciprocating the presser-heads, a rotating shaft located above the press, a swinging carrier mounted thereon and provided with a plurality of pairs of jaws, cams on said last-named shaft for actuating said jaws, cams on said last-named shaft adapted to engage one of said gripping devices when the latter is at the inner end of its traverse, and suitable cams for engaging the other one of said gripping devices when the latter is at the inner end of its traverse, for the purpose set forth.

71. The combination of coiling mechanism for forming transversely-extending coils; a press comprising reciprocating presser-heads; coil-rotating devices coanected with said presser-heads; knotting mechanism comprising knotting-pinions; transversely-reciprocating longitudinally-oscillating gripping devices and transversely-reciprocating revoluble gages coacting with said gripping devices; nesting mechanism equipped with an oscillating nester, a rotating shaft below said press equipped with cams for actuating one of the gripping devices of the knotting mechanism when said gripping device is at the inner end of its traverse, with a cam for oscillating a carrier, and with a cam for actuating the coil-rotating devices, a shaft in the rear of said first-named shaft equipped with cams for reciprocating the presser-heads, cams for actuating the knotting-pinions, a cam for actuating the nester, and a cam for reciprocating the gripping devices of the knotting mechanism, a rotating shaft located above said press and equipped with jaw-actuating cams and with cams for oscillating the other gripping device of the knotting mechanism, when the latter is at the inner end of its traverse, and a swinging carrier having its axis coincident with said last-named shaft and provided with actuating means engaging the appropriate cam of said first-named shaft and equipped with a plurality of pairs of jaws.

72. In a machine of the character described, the combination of knotting mechanism comprising knotting-pinions, a pair of transversely-reciprocating plungers, gripping devices rotatable upon said plungers, cams for oscillating said gripping devices when the latter are at the inner ends of their traverses; nesting mechanism; and a coil-carrier.

73. In a machine of the character described, the combination of knotting mechanism comprising a pair of reciprocating plungers, spring-held gripping devices mounted thereon and reciprocated thereby, cams for oscillating said gripping devices when at the inner ends of their traverses; suitably-actuated knotting-pinions; nesting mechanism; and a coil-carrier.

74. In a machine of the character described, the combination of knotting mechanism comprising suitably-actuated knotting-pinions, a pair of reciprocating plungers, spring-held gripping devices mounted on said plungers, cams serving to oscillate said gripping devices when at the inner ends of their traverses, a second pair of transversely-reciprocating plungers, slides in which the inner ends thereof are journaled, gage-heads on the inner end of said last-named plungers, means for rotating the gage-heads through the medium of their plungers; nesting mechanism; and a carrier.

75. In a machine of the character described, the combination of knotting mechanism comprising suitably-actuated knotting-pinions, transversely-reciprocating longitudinally-oscillating gripping devices, a pair of transversely-reciprocating rotatable plungers equipped at their inner ends with gages, rock-arms feathered on said plungers, cams serving to actuate said rock-arms; nesting mechanism; and a carrier.

76. In a machine of the character described, the combination of knotting mechanism comprising transversely-reciprocating longitudinally-oscillating gripping devices, a pair of transversely-reciprocating plungers equipped at their inner ends with gages, rock-arms having feathered connection with said plungers, a pair of knotting-pinions, a rotating shaft equipped with cams serving to actuate said rock-arms and with wheels serving to actuate said knotting-pinions; nesting mechanism comprising a suitable receiver, an oscillating nester, and means connected with said rotating shaft for oscillating said nester; and a carrier.

77. In a machine of the character described, the combination of knotting mechanism provided with suitably-actuated knotters, and shouldering devices for forming shoulders on the spiral adjacent to the knots; nesting mechanism; and a carrier.

78. The combination of coiling mechanism, equipped with suitable feed-rolls and gears, a rotating shaft geared to the coiling mechanism, a swinging carrier having its axis coincident with said shaft and provided with a plurality of pairs of jaws, cams on said shaft for actuating said jaws, cams on said shaft for oscillating a gripping device of the knotting mechanism, a second shaft geared to the coiling mechanism, and equipped with a cam serving to actuate said carrier and with a cam serving to actuate coil-rotating devices; a press comprising transversely-reciprocating presser-heads, coil-rotating devices connected with said presser-heads, a rock-shaft for actuating the last-named devices and in turn actuated from said last-named cam, a third rotating shaft geared to the second-named rotating shaft and equipped with cams serving to reciprocate the presser-heads; knotting-pinions, wheels on said third-named shaft serving to actuate said knotting-pinions, a pair of reciprocating plungers, a wheel on said third-named shaft serving to actuate said plungers; gripping devices carried by said plungers, a cam on said second-named shaft and a cam on said third-named shaft for oscillating one of said gripping devices, a second pair of transversely-reciprocating revoluble plungers, cams on said third-named shaft for reciprocating and rotating said last-named plungers, a receiver, an oscillating nester coacting therewith and a cam on said third-named shaft for actuating said nester.

79. The combination of coiling mechanism, including means for feeding a wire for forming the coils, and severing the coils from the wire; mechanisms for completing the springs; a carrier equipped with a plurality of coil-engaging means and serving to move the springs progressively through the machine; and means for interrupting the feed of the wire to permit severing.

80. In a machine of the character described, the combination of coiling mechanism, including means for feeding the wire, means for severing the wire, and a reciprocating coiling-roll having suitable actuating means provided with adjusting means including a forwardly-extending adjusting-handle; mechanisms for operating upon the spring in the rear of the coiling mechanism; and a carrier serving to move the springs progressively through the machine.

81. The combination of coiling mechanism; a press in the rear of the coiling mechanism; and a carrier in the rear of the coiling mechanism, said coiling mechanism comprising suitable feed-rolls, a shaft geared thereto, a second shaft in front of the first-named shaft and geared thereto and provided with a cam, an arm engaging said cam, a rock-arm adjustably connected with the rear end of said first-named arm and connected with a rock-shaft, and a reciprocating coiling-roll actuated from said rock-shaft.

82. The combination of coiling mechanism; a press in the rear of the coiling mechanism; and a carrier in the rear of the coiling mechanism, said coiling mechanism comprising suitable feed-rolls, a shaft geared thereto, a second shaft in front of the first-named shaft and geared thereto and provided with a cam, an arm engaging said cam, a rock-arm adjustably connected with the rear end of said first-named arm and connected with a rock-shaft, an adjusting-rod extending upwardly and forwardly from the adjusting means of said first-named rock-arm, a second rock-arm on said rock-shaft, and a coiling-roll reciprocated from said last-named rock-arm.

83. The combination of coiling mechanism; mechanisms for completing the spring; a carrier; and means for starting and stopping the machine, including a friction-clutch and a friction-brake connected with the driving-shaft of the coiling mechanism.

84. The combination of coiling mechanism; mechanisms for completing the spring; a carrier; and means for starting and stopping the machine, including a friction-clutch and a friction-brake connected with the driving-shaft of the machine and a hand-lever having a portion located between the clutch and brake, whereby movement of the hand-lever in one direction serves to throw the clutch into operation and movement of the hand-lever in the opposite direction serves to release the clutch and throw the brake into operation.

85. The combination of a suitable frame; coiling mechanism located at the front end of the machine and provided at one side of the machine with driving-gear, a hand-lever mounted adjacent to the driving-gear and having a handle extending from within reach at the opposite side of the machine; mechanisms in the rear of the coiling mechanism for completing the springs; and a carrier serving to move the springs progressively through the machine.

86. In a machine of the character described, the combination of knotting mechanism comprising suitably-actuated knotting-pinions, transversely-reciprocating longitudinally-oscillating gripping devices equipped with shouldering devices; means for actuating said shouldering devices when the knotting operations are completed; nesting mechanism; and a carrier.

87. In a machine of the character described, the reciprocating bending-roll, in combination with a rock-shaft serving to reciprocate the same; a rock-arm fixed to and actuated with said rock-shaft; a cam-arm D^{29}; an adjusting-screw joining said cam-arm to said last-named rock-arm; and an adjusting-rod having universal connection with said screw.

88. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire through said bending means, said wire-bending means operating to form the coil and project it at right angles to the path of the entering wire; independent knotting mechanism; and means for moving the formed springs from the place of formation and delivering them to the knotting mechanism, for the purpose set forth.

89. In a machine of the character described, an oscillating coil-carrier equipped with a plurality of pairs of jaws; means for opening and closing the jaws; and means for oscillating the carrier comprising a rock-arm, a rotating cam actuating said rock-arm, and connecting means between said rock-arm and said carrier.

90. In a machine of the character described, an oscillating carrier provided with a plurality of pairs of jaws equipped with pinion-segments; levers pivoted on the carrier and equipped with segments serving to actuate the jaws; and rotating cams serving to actuate said levers.

91. In a machine of the character described, an oscillating carrier provided with a plurality of pairs of jaws equipped with pinion-segments; bell-crank levers pivoted on the carrier and equipped with gear-segments; and rotating cams engaging the free ends of said bell-crank levers.

92. In a machine of the character described, an intermittently-actuated pivoted carrier, including pairs of jaws, each pair of jaws provided with intermeshing pinion-segments; a lever for each pair of jaws equipped with a segment meshing with a pinion-segment; and rotating cams actuating said levers.

93. In a machine of the character described, a press comprising a fixed transverse guide and a revoluble transverse guide; presser-heads reciprocable on said guides; coil-rotating devices rotatable on said presser-heads and equipped with pinion-segments; and gear-segments feathered on said revoluble shaft and having a movement of reciprocation with said presser-heads and serving to actuate the coil-rotating devices through the medium of said pinion-segments.

94. In a machine of the character described, a pair of reciprocating presser-heads connected to permit movement in opposite directions; a flexible connection joined to one of said presser-heads and passing over a pulley; a cam-arm connected with said flexible connection; and a cam actuating said cam-arm.

95. In a machine of the character described, a press comprising reciprocating presser-heads provided with inwardly-projecting coil-entering fingers and with perforations at each presser-head for the fingers of the companion presser-head; coil-rotating disks rotatably mounted with relation to said presser-heads and equipped with radial fingers; and means for actuating the coil-rotating disks when the latter are in engagement with the spring, for the purpose set forth.

96. In a machine of the character described, a pair of reciprocating presser-heads in combination with a pair of coil-rotating disks journaled on trunnions at the inner sides of the presser-heads, for the purpose set forth.

97. In a machine of the character described, a pair of reciprocating presser-heads; a rock-shaft extending through said presser-heads; a pair of coil-rotating disks rotatably mounted at the inner sides of the presser-heads and equipped with pinion-segments; and a pair of gear-segments splined upon the rock-shaft, for the purpose set forth.

98. In a machine of the character described, a pair of reciprocating presser-heads; a rock-shaft extending through said presser-heads; a pair of coil-rotating disks rotatably mounted at the inner sides of the presser-heads and equipped with pinion-segments; and a pair of gear-segments splined upon the rock-shaft, one of said gear-segments being internally toothed and the other externally toothed, for the purpose set forth.

99. In a machine of the character described, a pair of plungers; a rock-lever connected therewith; a rock-arm serving to actuate said rock-lever; a cam-wheel, serving to actuate said arm; gripping devices mounted upon said plungers; means for rotating the gripping devices on the plungers; and knotting-pinions.

100. In a machine of the character described, the combination of transversely-reciprocating longitudinally-oscillating gripping devices; a pair of reciprocating gages coacting therewith; means on the gripping devices for clamping the spiral near the extremities of the wire after the operation of the gages; means on the gripping devices for clamping the end rings of the spring; a frame member provided with means for engaging the ends of the wire and bending them across the end rings of the spring; and suitably-actuated knotters, for the purpose set forth.

101. In a machine of the character described, the combination of suitably-reciprocated plungers; gripping devices mounted thereon and equipped with gripper-slides; cams mounted on the plungers and connected with said gripper-slides; and means for yieldingly holding said cams when the gripping devices are rotated to carry the spring to the knotter.

102. In a machine of the character described, the combination of reciprocating plungers; gripping devices pivoted thereon; cams for oscillating the gripping devices on the plungers when the gripping devices are at the inner ends of their traverses; gripper-slides connected with the gripping devices; cams rotatably mounted with relation to said gripping devices and equipped with arms moving on yieldingly-held guides; and knotters to which the spring is carried when the gripping devices are oscillated on their plungers.

103. In a machine of the character described, a gripping device for the knotting mechanism, comprising a member pivotally supported on a plunger; a finger projecting from said member; a clamping finger coacting with said first-named finger and pivoted on said first-named member; and a plunger serving to move the pivoted finger.

104. In a machine of the character described, a gripping device for the knotting mechanism, comprising an oscillating member mounted on a plunger; a fixed gripping member carried by said oscillating member; a gripper-slide coacting with said gripping member; a cam rotatable with relation to said oscillating member and connected with said gripper-slide; means for yieldingly holding said cam when the oscillating member is swung upon its plunger, thereby to actuate the gripper-slide; a pin for engaging the coil near one end of the wire; a pivoted finger coacting with said pin; and means for closing the pivoted finger.

105. In a machine of the character described, a suitably-actuated plunger; an oscillating member mounted thereon and reciprocated thereby; a frame member provided with a guide for said member, permitting said member to be swung in one direction; a spring holding said member normally in engagement with its guide; a cam for swinging the oscillating member on its plunger; and means carried by the oscillating member for clamping a spring.

106. In a machine of the character described, a pair of suitably-actuated plungers; a pair of oscillating members mounted to swing on said plungers; transverse guides for said oscillating members permitting the latter to be swung in one direction; means for yieldingly holding said oscillating members normally in engagement with their guides; cams serving to swing said oscillating members on their plungers; gripping members fixed on said oscillating members; gripper-slides coacting therewith; cams serving to actuate the gripper-slides during oscillation of said first-named members on their plungers; clamps for engaging the spiral near the ends of the wire; means for actuating said clamps before the gripping devices have completed their rearward swing; a frame member provided with means for engaging and bending the ends of the wire and suitably-actuated knotting-pinions, for the purpose set forth.

107. In a machine of the character described, the combination with the pivoted clamping member of a gripping device; of a plunger equipped with a spring serving to actuate said pivoted member, said spring yielding to permit the gripping device to be swung rearwardly.

108. In a machine of the character described, the combination with the member E^3 of a gripping device; of a gripper-slide; a cam E^6 connected with said gripper-slide; and a yielding guide-rod E^{10} through the medium of which the cam E^6 is yieldingly held when the member E^3 is swung rearwardly, for the purpose set forth.

109. In a machine of the character described, the combination of a pair of transversely-reciprocating longitudinally-oscillating gripping devices equipped with pivoted clamping-fingers; and a pair of suitably-actuated plungers serving to actuate said clamping-fingers when the gripping devices are at the inner ends of their traverses.

110. The combination with the transversely-reciprocating rearwardly-swinging member E^3 of knotting mechanism; of a forked rotatable shouldering-stud e^{31}; and means for rotating said shouldering-stud while the member E^3 is at the rearward end of its swing.

111. In a machine of the character described, the combination of a pair of transversely-reciprocating longitudinally-oscillating gripping devices; a frame member provided with guides extending transversely of the machine; a pair of reciprocating slides connected with said guides; gages rotatably connected with said slides; pins carried by said gripping devices; clamping members coacting with said pins, the gages serving to properly locate the ends of the wire with relation to said pins; means on said frame member for engaging the ends of the wire and bending them about said pins as the gripping devices are swung rearwardly; and knotters; for the purpose set forth.

112. In a gripping device for knotting mechanism a member E^9 equipped with a member e^{32}; and a gripper-slide e^{33} coacting therewith.

113. In a gripping device for knotting mechanism, a member E^9 equipped with a member e^{32}; and a gripper-slide e^{33} coacting therewith, and equipped with a central projection e^{41}, for the purpose set forth.

114. In a gripping device for knotting mechanism, the combination with a swinging member E^3, of a forked pin e^{31} equipped with an actuating-arm E^{36}.

115. In a gripping device for knotting mechanism, the combination with a member E^3, of a forked pin e^{31} equipped with an actuating-arm E^{36} and a pivoted clamping member e^{41} coacting with said pin.

116. A gage device comprising a slide E^{21} and a gage-head E^{24} rotatably connected therewith and equipped with a finger e moving over the face of the slide.

117. In mechanism of the character described, the combination of a member E^3; a forked pin e^{31} journaled therein and provided with an actuating-arm E^{36}; and a rock-shaft journaled on the frame of the machine and provided with an arm adapted to engage the arm E^{36} when the spring is in engagement with the knotter.

118. In a machine of the character described, the combination with a pair of reciprocating slides, of rock-shafts equipped with gages at their inner ends and rotatably connected with said slides; rock-arms splined on the shafts; and cams actuating said rock-arms.

119. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire through said bending means, said wire-bending means operating to form the coil and project it at right angles to the path of the entering wire; knotting mechanism located in alinement with the coil when formed; and means for moving the coil in a path between the planes of the ends of the formed spring to bring the coil into the grasp of the knotting mechanism.

120. Knotting mechanism comprising knotters; and means for gripping a coil at its two ends and transferring the same to the knotters.

121. Knotting mechanism comprising oppositely-turned properly-spaced knotting-pinions; and means for gripping a coil at its two ends and transferring the same to the knotting-pinions.

122. Knotting mechanism comprising oppositely-turned properly-spaced knotting-pinions; means for gripping a coil at its two ends and transferring the same to the knotting-pinions; and gages operating to measure the lengths of the knot-forming portions of the wire preparatory to the knotting operation, for the purpose set forth.

123. Knotting mechanism, comprising knotters; swinging gripping devices serving to grip the coil at its ends and transfer the same to the knotters; gages serving to adjust the ends of the coil; and shoulders for bending the ends of the spring during the swinging movement of the gripping devices.

124. In a machine of the character described, nesting mechanism comprising a receiving-chute equipped at its front end with means for retaining a spring; and an oscillating arm equipped with a suitably-controlled depressible hook, for the purpose set forth.

125. In nesting mechanism, the combination of a curved receiving-chute; an oscillating arm; a hook pivoted thereon having an actuating-arm; a rod connected with said last-named arm; and a stationary friction device connected with said rod.

126. In nesting mechanism, the combination of a curved receiving-chute provided at its front end with spring-retaining means; an oscillating arm; a hook pivotally connected therewith and provided with an actuating-arm; a rod connected with said last-named arm and provided with a stop for the hook and a friction device engaging said rod.

127. The combination of a receiving-chute F^7; a pair of oscillating arms embracing the front portion of said chute; a hook pivotally supported on said arms and provided with an actuating-arm; a rod pivotally connected with said last-named arm; and a pair of spring-held friction-blocks engaging said rod.

128. In nesting mechanism, the combination of a coil-receiving chute provided at its front end with a contracted portion f^{13} and depending flaring guides f^{21} and with rearwardly-extending springs f^{22}; and means for withdrawing the coiled springs from the contracted portion of the receiving-chute.

129. Nesting mechanism, comprising a curved receiving-chute

810,050. CONCRETE OR CEMENT POST OR ANALOGOUS

Claim.—1. In a roller-driving device for printing-presses, a

130. Nesting mechanism, comprising a curved receiving-chute having a contracted front end and rearwardly-extending springs projecting from the contracted portion of the chute into the adjacent portion thereof; a pair of arms *f* supported by a rock-shaft *f'*, a depending cam-actuated rock-arm *f*^{3}; a coil-engaging hook *f*^{4}; and a friction-held actuating-rod for said hook, for the purpose set forth.

130. Nesting mechanism comprising a receiver; and means for delivering a spring thereinto transversely of the receiver and flexing the spring to permit the succeeding coil to enter in nesting.

131. Nesting mechanism comprising a receiving-chute; means for nesting coils and moving the same along the chute; and means for delivering coils to the chute transversely thereof.

132. In combination with mechanism for forming coil-springs, a carrier, comprising a pivoted jaw-support; a pair of jaws pivoted thereon; a rotating cam; and jaw-actuating means operated by said cam.

133. The combination of coiling mechanism; nesting mechanism; and means for advancing coils from the coiling mechanism to the nesting mechanism.

134. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire through said bending means, said wire-bending means operating to form the coil and project it at right angles to the path of the entering wire; mechanism equipped with coil-grippers serving to grasp the coils and convey them from the coiling mechanism, and mechanisms coöperating with said grippers and serving to perform the operations of pressing and knotting the spring, for the purpose set forth.

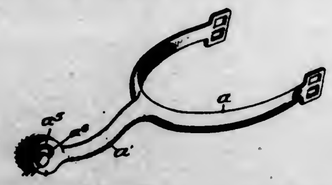
135. The combination of coiling mechanism; independent knotting mechanism; and a suitably-actuated carrier provided with coil-engaging means and serving to transfer coils from the coiling mechanism to the knotting mechanism.

136. In a machine of the character described, the combination of mechanism for operating upon a coil-spring; nesting mechanism; and means for automatically advancing the coils to the nesting mechanism.

137. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire therethrough, said wire-bending means constructed and operating to form the coil and project it at substantially right angles to the path of the entering wire; and automatic means for performing the knotting operation and advancing the coils, for the purpose set forth.

138. The combination of coiling mechanism having wire-bending means and feed-rolls for forcing the wire therethrough, said wire-bending means constructed and operating to form the coil and project it at substantially right angles to the path of the entering wire; knotting mechanism actuated and timed to coöperate therewith; and automatic means serving to bring the coil and knotting mechanism into operative engagement, for the purpose set forth.

810,049. SPUR. BENJAMIN G. GILBOUSE, Chicago, Ill. Filed Apr. 8, 1905. Serial No. 254,519.



Claim.—1. In a spur, the combination with a rim and a bifurcated neck carried thereby having an enlarged end provided with a slot having shoulders corresponding with the sheathed and projected positions of the rowel, respectively, and a rowel having an axis received by and shiftable in said slot, for the purpose set forth.

2. In a spur, the combination with a rim and a neck carried thereby having an enlarged end provided with a channel of great enough depth to sheath a rowel, a rowel in said channel slidably connected with said enlarged end, and means for securing the rowel in either its projected or sheathed position, at will.

3. In a spur, the combination with a rim and neck carried thereby having bifurcations having enlarged ends and provided with an upwardly-bowed slot having shoulders corresponding with the projected and sheathed positions of a rowel, and a rowel mounted between said bifurcations and having an axis shiftable in said slot, for the purpose set forth.

810,050. CONCRETE OR CEMENT POST OR ANALOGOUS STRUCTURE. GEORGE F. GREBER, Detroit, Mich. Filed Mar. 15, 1905. Serial No. 250,194.

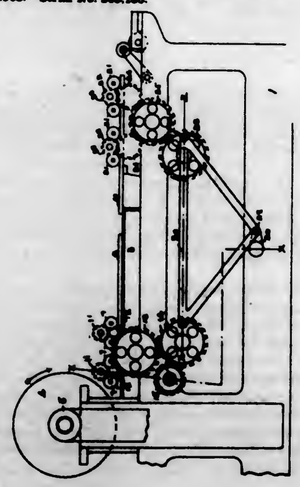
Claim.—1. A concrete, cement or analogous structure having in combination therewith a perforated nailing-strip located upon one of the outer faces of the structure, a clamping device having a perforated body to engage the face of the nailing-strip and provided with flanges at the extremities of the body thereof projecting over the lateral edges of the nailing-strip, and a bolt separable from the clamping device passed through the perforated nailing-strip, and the perforated body of the clamping device and engaged with the cement structure to secure the clamping device and nailing-strip to said structure.

2. In combination a concrete, cement or analogous structure a perforated nailing-strip upon one face thereof, a clamping device formed of sheet metal having a perforated body to extend crosswise over the face of the strip and provided with flanges at the extremity of the body thereof, a bolt separable from the clamping device and passed through the perforated body of the device and perforated nailing-strip and engaged with the cement structure to hold the nailing-strip in place, said clamping device provided with flanges at the extremities of said body projecting over the lateral edges of the nailing-strip for the purpose described, horizontal fence-wires, and staples driven into the outer face of said nailing-strip to hold the wires in place.

3. In combination a concrete, cement or analogous structure, a perforated nailing-strip upon one face thereof, a clamping device having flanges at its extremities to extend crosswise over the face and over the lateral edges of the strip, and a bolt separable from the clamping device passed through the clamping device and engaged with said structure to hold the nailing-strip in place, said structure provided with an integral cap toward the upper end thereof projecting over the upper end of the nailing-strip, and over the corresponding face of the body of the structure.

4. A concrete, cement, or analogous structure provided with a nailing-strip secured upon one face of the structure, and extending across the full width of said structure, a flanged clamping device to engage across the face of the nailing-strip, and a bolt separable from the clamping device and passed through the clamping device and through the post to secure the clamping device and nailing-strip to the body of the structure, the flanges of the clamping device projecting over the lateral edges of the nailing-strip and upon the lateral surfaces of the cement structure.

810,051. INK-ROLLER-DRIVING MECHANISM FOR PRINTING-PRESSES. RUSSELL HALL, Taunton, Mass., assignor to The Huber-Hodgman Printing Press Company, Taunton, Mass. Filed June 14, 1905. Serial No. 265,126.



Claim.—1. In a roller-driving device for printing-presses, a driving member, a driven member, and an intermediate member or idler, a connecting-rod between the driving and driven members, and connecting-rods between the idler and each of the other members substantially as shown and described.

2. In a roller-driving device for printing-presses, a driving member, a driven member and an intermediate driven member or idler, crank-pins and connecting-rods operatively connected with said members substantially as shown and described.

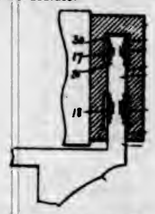
3. In a printing-machine having groups of inking-rollers located some distance apart, a driving member connected with a driven member by means of a connecting-rod and crank-pins, and a second driven member or idler connected with said driving and driven members by means of connecting-rods and crank-pins, said second driven member being so located in relation to the said driving and driven member as to prevent any dead-center in the operation of the mechanism.

4. A roller-driving device for printing-presses, consisting of the following instrumentalities, a connecting-rod or yoke operating in connection with three crank-pins which are respectively carried by a driving member, a driven member and a driven idler member, together with suitable gearing substantially as shown.

5. In a roller-driving device for printing-presses, the combination of the rollers, a driving crank member, a driven crank member, a second driven crank member or idler, a connecting-rod or yoke connecting all three of the said crank members, and suitable gearing between the said driven crank member and the rollers, substantially as shown.

6. In a roller-driving device for printing-presses, a crank-driving member 14, connecting means between said crank-driving member and the reciprocating bed 3, a driven crank member 26, a driven crank member or idler 29, a connecting-rod or yoke 20, connecting all three of the said crank members, and suitable gearing between the driven crank member 26 and the rollers 21.

810,052. HINGE. ELIJAH C. HALL, Braintree, Mass. Filed Nov. 12, 1904. Serial No. 232,469.



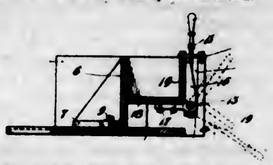
Claim.—1. In a hinge, in combination, a member provided with a pintle having a non-circular section and a circular section, and a coöperating socketed member provided with a non-circular section to coöperate with the non-circular section of the pintle and lock the socketed member from turning, and having an enlarged section to coöperate with the non-circular section of said pintle to permit the socketed member to turn, substantially as described.

2. In a hinge, in combination, a member provided with a pintle having a non-circular section and a circular section, a coöperating socketed member provided with a non-circular section to coöperate with the non-circular section of the pintle and lock the socketed member from turning, and having an enlarged section to coöperate with the non-circular section of said pintle to permit the socketed member to turn, a lip or projection on the circular section, and a shoulder in the socketed member, substantially as described.

3. In a hinge, in combination, a stationary member provided with a pintle having a non-circular section intermediate its ends, and a movable socketed member closed at its upper end and provided with a non-circular section coöperating with the non-circular section of the pintle to lock the socketed member from turning and having an enlarged section to coöperate with the non-circular section of said pintle to permit the socketed member to turn, substantially as described.

810,053. FLASK FOR MOLDING CONCRETE BLOCKS. JOHN HAHN, Minneapolis, Minn. Filed Feb. 23, 1905. Serial No. 247,573.

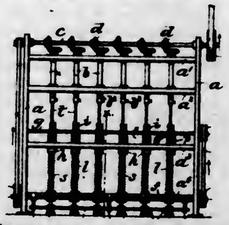
Claim.—1. In a device of the character described, the combination with end plates 2 and a side plate 6, of a rock-shaft mounted for vertical adjustments and provided with a lever for rocking it, and a bottom plate and a side plate carried by said rock-shaft to and from operative position, substantially as described.



2. In a device of the character described, the combination with laterally-adjustable end and side plates 2 and 6 respectively, of a vertical adjustable rock-shaft 13 provided with an operative lever 14, and with L-shaped levers 16, and a bottom plate 18 and a side plate 19, supported by said levers 16 and movable by said rock-shaft, to and from operative position, substantially as described.

3. The combination with a bed-plate 1, of the end plates 2 and side plate 6 mounted for relative lateral adjustments on said bed-plate, vertically-adjustable bearings 12 mounted in said end plates, a rock-shaft mounted in said bearings and provided with an operating-lever 14 and with L-shaped levers 16, and a bottom plate 18 and side plate 19, mounted on and carried by said levers 16, substantially as described.

810,054. NUT-TAPPING MACHINE. SETH H. HUNTLIAN, Providence, R. I. Filed Jan. 10, 1905. Serial No. 240,413.



Claim.—1. In a nut-tapping machine, the combination with a series of suitably-mounted revoluble taps and a corresponding series or number of spring-pressed holders for the nut-blanks arranged with respect to said taps, of chutes from which the nut-blanks are fed to said holders, treadle-levers operatively connected with and arranged to retract the several blank-holders, and a power-actuated device adapted to engage with and control the movements of the treadle-levers, substantially as described and for the purpose set forth.

2. In a nut-tapping machine, the combination with a vertically-movable nut-blank holder, a revoluble tap arranged in alinement with said holder and a rocking blank containing a chute communicating with and taking its movement from said holder.

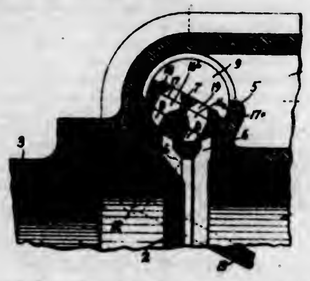
3. In a nut-tapping machine, having a revoluble tap, the combination therewith of a vertically-movable spring-pressed nut-blank holder located below and in alinement with the tap, and a vibratory feeding-chute connected with the holder and taking its movement therefrom.

4. In a nut-tapping machine, the combination with a plurality of revoluble taps, and a corresponding number of endwise-movable mechanically-actuated holders adapted to receive nut-blanks singly therein and subject them to the cutting action of said taps, of a revoluble shaft *g*, a plurality of chutes pivotally connected to the holders and mounted to vibrate or swing on said shaft having their inner ends directly communicating with said holders, and traveling belts *p* mounted in the base of the chutes for feeding the blanks therefrom into the holders, said belts being driven by power transmitted from said shaft.

5. In a nut-tapping machine, the combination with a revoluble tap, a nut-blank holder movable endwise relative to said tap, a swinging chute taking its motion from said holder, and a downwardly-slanting continuously-traveling belt mounted upon two rollers, one fixed and the other mounted on the movable holder, said belt extending through an opening formed in the base of the chute, of means for automatically depressing the holder after the blank therein has been tapped, thereby at the same time increasing the tension upon said belt and causing it to mechanically feed the next succeeding nut-blank from the chute into the holder, substantially as described.

6. In a nut-tapping machine, the combination with a revolubie tap, of an endwise-movable holder for the nut-blank, a vibratory feed-chute pivotally connected to the holder and taking its movement therefrom, and a feed-belt, a plurality of rollers, said belt being mounted upon said rollers, one fixed and the other mounted on the movable holder, the tension of said belt being affected by the movement of said holder and regulating the feed of the nut-blanks to the holder as the position of the latter varies.

810,055. ENGINE-VALVE. ROBERT C. HOLMAN, Hamilton, Ohio. Filed Sept. 16, 1905. Serial No. 278,266.



Claim.—1. In a valve-engine, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, a bonnet closing one end of the valve-seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed on the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through said bonnet, and means for rocking the two valves in unison and for reciprocating the cut-off valve relative to the main valve.

2. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, bonnets closing the ends of said seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a cam-bar mounted for reciprocation in a line at right angles to the axis of the main valve, connections for reciprocating the cam-bar, and connections between the valve-stem and cam-bar whereby the reciprocations of the cam-bar effect the reciprocation of the cut-off valve relative to the main valve.

3. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having several parallel ports leading to a cylinder, bonnets closing the ends of said seat, several main valves fitted to rock in said seat and provided with several longitudinal lines of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a housing having a guideway in prolongation of the line of said stem and having also a guideway at right angles to and intersecting the first-mentioned guideway, a mortised plug sliding in the first-mentioned guideway, a connection between said valve-stem and plug, a cam-bar mounted for reciprocation in a line at right angles to the axis of the main valve, connections for reciprocating the cam-bar, and connections between the valve-stem and cam-bar whereby the reciprocations of the cam-bar effect the reciprocation of the cut-off valve relative to the main valve.

4. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having several parallel ports leading to a cylinder, longitudinal guide-ribs carried by the main valve at each side of the valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally between the guide-ribs and upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a cam-bar mounted for reciprocation in a line at right angles to the axis of the main valve, connections for reciprocating the cam-bar, and connections between the valve-stem and cam-bar whereby the reciprocations of the cam-bar effect the reciprocation of the cut-off valve relative to the main valve.

5. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, bonnets closing the ends of said seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a housing having a guideway in prolongation of the line of said stem, a plug mounted for reciprocation in said guideway, connections between said valve-stem and plug, a cam-bar mounted for reciprocation in said housing in a plane at right angles to the axis of the main valve, and connections between the cam-bar and plug whereby the reciprocations of the cam-bar effect the reciprocation of the cut-off valve relative to the main valve.

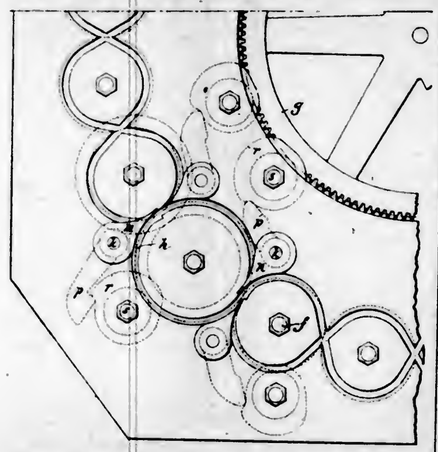
6. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, bonnets closing the ends of said seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a housing having a guideway in prolongation of the line of said stem, a plug mounted for reciprocation in said guideway, a swivel-coupling uniting said valve-stem and plug, a cam-bar mounted for reciprocation in said housing in a plane at right angles to the axis of the main valve, and connections between the cam-bar and plug whereby the reciprocations of the cam-bar effect the reciprocation of the cut-off valve relative to the main valve.

7. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, bonnets closing the ends of said seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a housing having a guideway in prolongation of the line of said stem, a transversely-mortised plug fitted to slide in said guideway, connections between said valve-stem and plug, a cam-bar fitted to slide transversely through said housing and mortised in a path at right angles to the axis of the main valve, and antifriction-rollers carried by said plug and straddling said cam-bar.

8. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having a port leading to a cylinder, bonnets closing the ends of said seat, a main valve fitted to rock in said seat and provided with a longitudinal line of ports extending through it and having a valve-seat formed upon its back, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having a longitudinal line of ports extending through it, a valve-stem connected with said cut-off valve and projecting through one of said bonnets, a housing having a guideway in prolongation of the line of said stem and having also a guideway at right angles to and intersecting the first-mentioned guideway, a mortised plug sliding in the first-mentioned guideway, a connection between said valve-stem and plug, a cam-bar mounted to slide in the last-mentioned guideway and through the mortise in the plug, engaging surfaces carried by the plug and straddling the cam-bar, and a bolted joint of separation in said housing at right angles to the axis of the first-mentioned guideway and in the general plane of the last-mentioned guideway.

9. In an engine-valve, the combination, substantially as set forth, of a cylindrical valve-seat having several parallel ports leading to a cylinder, a first bonnet closing one end of said seat, a main valve fitted to rock in said seat and provided with several longitudinal lines of ports extending through it and having a valve-seat formed upon its back, a main-valve stem journaled in said bonnet and engaging said main valve within said valve-seat, a rocker-arm on the outer portion of said main-valve stem, a cut-off valve fitted to slide longitudinally upon the seat formed upon the back of the main valve and having several longitudinal lines of ports extending through it, a second bonnet closing the remaining end of said valve-seat, a cut-off-valve stem connected with said cut-off valve and projecting outwardly through said second bonnet, a housing supported by said second bonnet and having a first guideway in prolongation of the line of said cut-off-valve stem and having a second guideway at right angles to and intersecting the first guideway, a mortised plug fitted to slide in the first guideway, a coupling uniting the cut-off-valve stem with the plug, a cam-bar fitted to slide in the second guideway, and rolls carried by said plug and straddling the cam-bar.

810,056. BRAIDING-MACHINE. HENRY JANSSEN, Wyomissing, Pa., assignor to The Textile Machine Works, Wyomissing, Pa., Incorporated. Filed Feb. 13, 1905. Serial No. 245,814.



Claim.—1. In a braiding-machine the combination of two series of race circle-ways having a common terminal circle-way, separate series of bobbin-carriers therefor, a common terminal driving-head provided with an odd number of carrier-engaging horns for each series of carriers, means for rotating said driving-head with an angular velocity corresponding with such odd number of horns, a switch at each junction of said common terminal circle-way with an adjoining race circle-way, and a driving-head mechanism having switch-operating connections whereby alternating carriers of the two series are regularly guided in interlocking passes through the common circle-way and returned to their separate courses substantially as set forth.

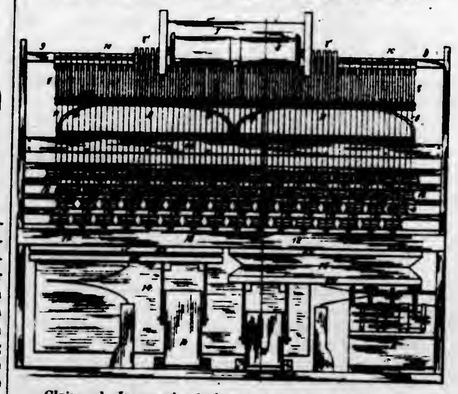
2. In a braiding-machine the combination of two series of race circle-ways having a common terminal circle-way, separate series of bobbin-carriers therefor, a common terminal driving-head provided with an odd number of carrier-engaging horns for each series of carriers means for rotating said driving-head with an angular velocity corresponding with such odd number of horns, a pair of oppositely-arranged switches at each junction of said common terminal circle-way with an adjoining race circle-way, and double-acting switch-operating cams whereby alternating carriers of the two series are regularly guided in interlocking passes through the common circle-way and respectively returned to their separate courses during either the normal or reverse travel of the carriers substantially as set forth.

3. In a braiding-machine the combination of two series of race circle-ways having a common terminal circle-way, separate series of bobbin-carriers with driving-heads therefor, a common terminal driving-head provided with an odd number of carrier-engaging horns for each series of carriers means for rotating said driving-heads with an angular velocity corresponding with such odd number of horns, a spring-actuated switch at each junction of said common race circle-way with an adjoining race circle-way and provided with a cam-engaging arm, and a cam for each of said switches arranged in gear with the driving-head and adapted to turn and hold said switches as required to guide alternating carriers of the two series in interlocking passes through the common circle-way and return the several carriers to their separate courses, substantially as set forth.

4. In a braiding-machine the combination of two series of race circle-ways having a common terminal circle-way, separate series of bobbin-carriers therefor, a common terminal driving-head provided with an odd number of carrier-engaging horns for each series of carriers means for rotating said driving-head with an angular velocity corresponding with such odd number of horns, a switch at each junction of said common terminal circle-way with an adjoining race circle-way, and switch-operating mechanism whereby alternating carriers of two series are regularly guided in interlocking passes through the common circle-way and returned to their separate courses substantially as set forth.

5. In a braiding-machine the combination of two series of race circle-ways having a common terminal circle-way, separate series of bobbin-carriers therefor, a common terminal driving-head provided with an odd number of carrier-engaging horns for each series of carriers means for rotating said driving-head with an angular velocity corresponding with such odd number of horns, a pair of oppositely-arranged switches at each junction of said common terminal circle-way with an adjoining race circle-way, and switch-operating cams whereby alternating carriers of the two series are regularly guided in interlocking passes through the common circle-way and respectively returned to their separate courses during either the normal or reverse travel of the carriers substantially as set forth.

810,057. MECHANICAL MUSICAL-INSTRUMENT PLAYER. LAWRENCE U. JONES, Cincinnati, Ohio, assignor to The Baldwin Company, Hamilton, Ohio. Filed July 6, 1903. Serial No. 164,390.



Claim.—1. In a mechanical musical-instrument player the key-levers 8 having a straight portion extending from the flange 10 to the striking-point 38, and a curved portion extending with a downward sweep from the flange 10 to the point of contact with the lifter-rods 11, substantially as described.

2. In a mechanical musical-instrument player the key-levers 8' having a straight portion extending from the flange 10 to the striking-point 38 and a curved portion extending with an upward sweep from the flange 10 to the point of contact with the lifter-rods 11, substantially as described.

3. In a mechanical musical-instrument player, the combination of the key-levers 8 having a straight portion extending from the flange 10 to the striking-point 38 and a curved portion extending with a downward sweep from the flange 10 to the point of contact with the lifter-rods 11 with the key-levers 8' having a straight portion extending from the flange 10 to the striking-point 38 and a curved portion with an upward sweep from the flange 10 to the point of contact with the lifter-rods 11, substantially as described.

4. In a mechanical musical-instrument player the combination of the primary valve-box 5, the intermediate valve-box 7 placed below and at the rear of the primary valve-box, and the striking-pneumatic 6 placed directly under the primary valve-box and in the front of the intermediate valve-box 7, the whole being under the action of the exhaust by means of the channels 20 leading from the intermediate valve-box to the primary valve-box, and the passages 21 leading from the intermediate valve-box to the striking-pneumatic, substantially as described.

5. In a mechanical musical-instrument player the combination of the primary valve-box 5, the intermediate valve-box 7 placed below and at the rear of the primary valve-box, the striking-pneumatics 6 placed directly under the primary valve-box and in front of the intermediate valve-box, and the attachable and detachable valve-shelf 36, secured to the front wall of the intermediate valve-box, said

valve-shelf having the striking-pneumatics attached to the same, the primary valve-box, the intermediate valve-box and the striking-pneumatics being under the action of the exhaust by means of the channels 20 leading from the intermediate valve-box, and the passages 21 leading from the intermediate valve-box to the striking-pneumatics, substantially as described.

6. In a mechanical musical-instrument player, the combination of a wind-chest, with an expression-box and an equalizing-bellows connected therewith; said wind-chest consisting of a box in which the top and bottom boards thereof are attached continuously to a rim; said wind-chest having an air-channel within the same separated by walls from the main air-space of the chest, and vents adapted to lead from said channel to the outside of said wind-chest, also vents connecting said channel and said main air-space with said expression-box; and passages leading from said main air-space to said equalizing-bellows, substantially as described.

7. In a mechanical musical-instrument player the combination of a wind-chest 13, consisting of a box in which the top and bottom boards thereof are attached continuously to a rim 46, and having a channel 54 within the same separated by walls 53 from the main air-space of said chest; with an intermediate valve-box 7 connected with the channel 54 by the vents 50; an expression-box 56 connected with said channel by the vent 51 and with the main air-space of said chest by the vent 52; an equalising-bellows 14 connected with said main air-space by the vents 48 and 49; and the exhaust-bellows 15 connected with said main air-space by the valve-holes 47, substantially as described.

810,058. VARIABLE-SPEED GEAR. PETER W. KANE, Mason City, Iowa. Filed Dec. 31, 1904. Serial No. 239,121.

Claim.—1. The combination with a cone of gears consisting of a plurality of parallel gear-wheels and a spiral gear crossing said gear-wheels and forming parts of the latter at the points of crossing, of a movable gear-wheel 16, means for guiding the latter automatically to follow the path of said spiral gear, said means adjustable to hold said movable gear in mesh with either of said parallel gear-wheels.

2. The combination with a pair of shafts, of a series of change-gears on one shaft, a sleeve-bearing having a gear-wheel thereon provided with oppositely-inclined screw-threads and a series of circular grooves therein, and a guide for shifting said sleeve-bearing to move said gear-wheel from one to another of said change-gears.

3. The combination with a cone of gears comprising parallel and spiral gears, of a shaft 13, a sleeve-shaft and the gear-wheel 16 movably mounted on said shaft 13, said sleeve-shaft having the oppositely-arranged spiral grooves and the circular grooves, and the guide 23 arranged to hold said sleeve-shaft stationary on shaft 13, or to move said sleeve-shaft along said shaft 13, substantially as and for the purpose set forth.

810,059. PROCESS OF PREVENTING THE FORMATION OF SCAFFOLDS IN KILNS. TOM C. KING, New York, N. Y., assignor to National Metallurgic Company, Jersey City, N. J., a Corporation of New Jersey. Filed Sept. 6, 1905. Serial No. 277,134.

Claim.—1. The herein-described method for removing scaffolds or rings of fused material from the sides of the kiln which consists in charging against said material, forming such rings or scaffolds, calcium fluorid.

2. The herein-described method of removing adhering masses of material from the sides of kilns or retorts which consists in charging against said material a requisite quantity of calcium fluorid to flux the same.

3. The herein-described method for removing adhering masses of fused material from the sides of the kiln which consists in charging against such adhering masses calcium fluorid and maintaining the material at a high temperature during the charging of said calcium fluorid against the same.

810,060. PACKING-CASE. GEORGE H. LOMERSON, Howard, Pa. Filed Sept. 16, 1905. Serial No. 278,148.

Claim.—1. A case for carrying explosives and explosive devices, comprising a soft and flexible body shaped to snugly receive and hold against casual movement therein the explosive or explosive devices, and having a layer of fireproof material and another layer of waterproof material, and a cover detachably connected to the body; the said cover being soft and yielding at its inner side and having at each side a layer of fireproof material and another layer of waterproof material.

2. In a case for carrying explosives and explosive devices, the combination with a body shaped to snugly receive and hold against casual movement therein the explosive or explosive devices and comprising an inner layer of felt, a corrugated layer surrounding the felt layer, a rubber layer surrounding the corrugated layer and an asbestos layer surrounding the rubber layer; of a removable cover connected to the body and having similarly-arranged layers of felt, corrugated material, rubber and asbestos.

810,061. PNEUMATIC-CUSHION WHEEL. CHARLES A. LEE, Kansas City, Kans., assignor of one-half to Albert J. Holmark, Kansas City, Kans. Filed June 26, 1905. Serial No. 267,471.

Claim.—1. A wheel, comprising a rigid inner portion having an encircling ring, a rigid outer portion having an inner circular ring and an outer encircling ring, a circular pneumatic cushion between the ring of the inner portion and the inner ring of the outer portion, and radial rods extending through the pneumatic cushion and the rings in contact therewith and clamping the latter tightly upon the former.

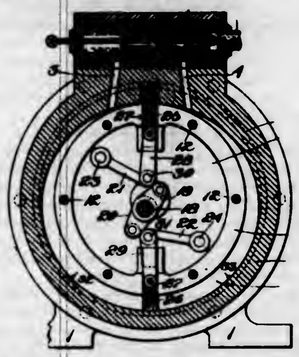
2. A wheel, comprising a rigid inner portion having an encircling ring, a rigid outer portion having an inner circular ring and an outer encircling ring, a circular pneumatic cushion between the ring of the inner portion and the inner ring of the outer portion, and radial rods extending through the pneumatic cushion and through the rings in contact therewith and secured rigidly to one of the portions of the wheel and provided with cap-screws at their opposite ends.

3. A wheel, comprising a rigid inner portion having an encircling ring, a rigid outer portion having an inner circular ring and an outer encircling ring, a circular pneumatic cushion between the ring of the inner portion and the inner ring of the outer portion, radial rods extending through the pneumatic cushion and through the rings in contact therewith and secured rigidly to one of the portions of the wheel and provided with cap-screws at their opposite ends, and cushions mounted on said rods and interposed between the cap-screws and the contiguous ring.

4. A wheel, comprising a rigid inner portion having an encircling ring, a rigid outer portion having an inner circular ring and an outer encircling ring, a circular pneumatic cushion between the ring of the inner portion and the inner ring of the outer portion and provided with radial tubular cross-pieces, and radial rods extending through the tubular cross-pieces and the rings in contact with the pneumatic cushion.

5. A wheel, comprising a rigid inner portion having an encircling ring provided with apertures, a rigid outer portion having an outer and an inner ring, the latter provided with slots in radial alinement with said apertures, a circular pneumatic cushion fitting between the ring of the inner portion and the inner ring of the outer portion and provided with radial tubular cross-pieces registering with said radially-alined apertures and slots, rods extending through the said tubular cross-pieces and the registering apertures and slots and secured rigidly at their inner ends to the inner portion of the wheel, cap-screws engaging the outer ends of said rods, and cushions upon the rods and interposed between said cap-screws and the inner ring of the outer portion of the wheel.

810,062. ROTARY ENGINE. GOTTLOB A. L. LIND, New Dorchester, Miss. Filed June 13, 1905. Serial No. 265,012.



Claim.—1. The combination, with a rotary engine, having a cylinder, a piston, a carrier for said piston, and an engine-shaft driven by said carrier and piston, of a reversing-shaft having an eccentric crank-pin within said cylinder, and connections between said piston and crank-pin for maintaining said piston under positive control at all times.

2. The combination, with a rotary engine, having a cylinder, a piston, a carrier for said piston, and an engine-shaft driven by said carrier and piston, of a reversing-shaft having an eccentric crank-pin within said cylinder, and connecting means between said piston and crank-pin for maintaining a noiseless operation of the piston and its operating parts.

3. The combination, with a rotary engine, having a cylinder, a piston, a carrier for said piston, and an engine-shaft driven by said carrier and piston, of a reversing-shaft having an eccentric crank-pin within said cylinder, and means movable with said carrier and connected to said piston and crank-pin for positively moving said piston outwardly during the working travel of the piston.

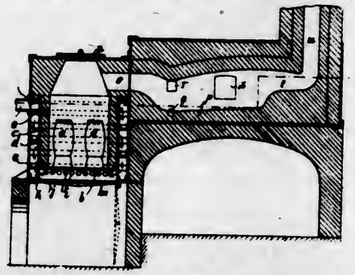
4. The combination, with a rotary engine, having a cylinder, a piston, a carrier for said piston, and an engine-shaft driven by said carrier and piston, of a reversing-shaft having an eccentric crank-pin within said cylinder, an arm pivoted on said crank-pin, a link pivotally connected to said arm, and means cooperating with said link and arm for positively moving said piston out and in relatively to said cylinder.

5. The combination, with a rotary engine, having a cylinder, a piston, a carrier for said piston, and an engine-shaft driven by said carrier and piston, of a reversing-shaft having an eccentric crank-pin within said cylinder, an arm pivoted on said crank-pin, a lever pivoted to said carrier and arm, and a link pivotally connecting said lever and piston.

6. In a rotary engine, a cylinder, a piston-carrier, a piston radially movable in said carrier, means for automatically moving said piston, and packing-plates carried by said carrier and yieldingly engaging the opposite ends of said piston, said carrier and cylinder being relatively eccentric, and said packing-plates extending outwardly in said carrier coextensive with the outermost movement of said piston.

7. In a rotary engine, a cylinder, a piston-carrier, a piston radially movable in said carrier, means for automatically moving said piston, and packing-plates carried by said carrier and yieldingly engaging the opposite ends of said piston, said carrier and cylinder being relatively eccentric, and said packing-plates extending outwardly in said carrier coextensive with the outermost movement of said piston, and opposite packing-rings carried by said carrier and embracing the outer ends of said plates.

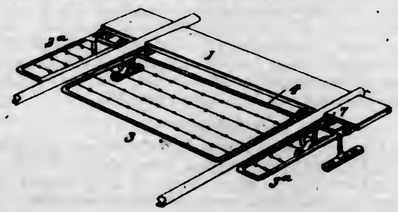
810,063. DUPLEX SMELTING-FURNACE. ROBERT LEIDEMANN, Osnabrück, Germany. Filed Mar. 10, 1905. Serial No. 249,444.



Claim.—1. In a duplex smelting-furnace, a primary hearth capable of being intensely heated, an inner refractory wall around said hearth, an outer metal casing surrounding said inner wall, air-passages in said outer casing, an air-inlet communicating with the said air-passages and with a source of air under pressure, a baffle-plate for directing the admission of the air in opposite directions from the said air-passages round the furnace to the said hearth, air-holes at the base of the primary hearth for admitting the air under pressure thereto, a movable plate adapted to shut off hermetically the ash-pit from the primary hearth, and a secondary hearth alongside the primary hearth and capable of being heated by the waste heat from the primary hearth.

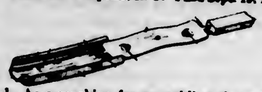
2. In a duplex smelting-furnace a primary hearth, the air-inlet *f*, the hollow metallic jacket *d* surrounding said hearth, baffles *e* and dividing-plate *g* in said metallic jacket adapted to divide the blast and pass it in serpentine or zigzag directions around said hearth and discharge the heated blast beneath said hearth, the plate having perforations *i* for admitting air to the fuel on the hearth, the hinged plate *m* adapted to control the admission of air to the primary hearth from below the same, a secondary smelting-hearth and an escape to the outer air for the combustion products.

810,064. CATTLE-GUARD. WILLIAM D. LINSCOTT, Piedmont, S. D. Filed July 3, 1905. Serial No. 268,208.



Claim.—In a cattle-guard, the combination of a movable platform, a gate normally in horizontal position and embodying sides pivotally connected at one end with the platform, and a rock-shaft having pivotal connection with the sides of the gate between the ends of the latter, said rock-shaft having end cranks pivotally mounted in suitable supports.

810,065. MACHINE FOR ASSEMBLING CARTRIDGE-CLIPS. OSBORN M. LIBBAY, Westpoint, N. Y. Filed Sept. 19, 1904. Serial No. 224,962.



Claim.—1. As a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, a carrier for the clip-body, a guideway in said table for said carrier, a guideway in said table for the spring, said spring-guideway having a flanged portion overhanging the guideway and inclining downward, said guideways being at right angles and intersecting, means to move said spring in its guideway and the carrier in its guideway.

2. As a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, a carrier for the clip-body, a guideway in said table for said carrier, a guideway in said table for the spring, said guideways being at right angles and intersecting, means to move said spring in its guideway, and the carrier in its guideway, there being an orifice in said table at the point of juncture of said guideways, adapted to be covered by said carrier.

3. As a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, a carrier for the clip-body, a guideway in said table for said carrier, a guideway in said table for the spring, said guideways being at right angles and intersecting, means to move said spring in its guideway and the carrier in its guideway, there being an orifice in said table at the point of juncture of said guideways, adapted to be covered by said carrier, means to return the carrier and means to hold the clip from returning with the carrier.

4. As a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, a carrier for the clip-body, a guideway in said table for said carrier, a guideway in said table for the spring, said guideways being at right angles and intersecting, means to move said spring in its guideways and the carrier in its guideway, there being an orifice in said table at the point of juncture of said guideways, adapted to be covered by said carrier, and a pivoted hook or dog overhanging said orifice above said carrier and adapted to engage the clip.

5. As a machine for assembling the spring and body portion of a cartridge-clip, in combination, a table, a carrier for the clip-body, a guideway, in said table for said carrier, a guideway in said table for the spring, said guideways being at right angles and intersecting, a pivoted lever connected to said carrier, a spring acting to hold said lever in one position, a movable frame, said lever being in line of movement of one portion of said frame, another portion of said frame being in line with the spring-guide, and means to move said frame.

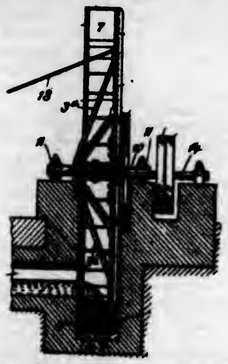
6. In a machine for assembling the spring and body portions of a cartridge-clip, a table having guideways at right angles to and intersecting each other, means to bring the spring within the body portion at the juncture of said guides, there being an orifice through the table at the point of juncture of the guideways, and means to cover and uncover said orifice.

7. In a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, means to move the spring on said table, a carrier for the body means to hold said carrier and contained clip-body in line of movement of the spring, there being an orifice in the table beneath the carrier at that point, means to move the carrier for the clip-body and means at that point to hold the clip-body from movement with the carrier.

8. In a machine for assembling the spring and body portions of a cartridge-clip, in combination, a table, means to move the spring in said table, a carrier for the clip-body, means to hold said carrier and contained clip-body in line of movement of the spring, there being an orifice in the table beneath the carrier at that point, and means at that point to hold the clip-body from movement.

810,066. LIFTING AND SEPARATING WHEEL. ALFRED HAGEN, Chemnitz, Prussia. Filed Mar. 4, 1905. Serial No. 248,762.

Claim.—1. An elevating and separating wheel having two series of pockets adapted to discharge at different elevations and formed by partitions, the partitions forming one series of pockets being penetrable to one constituent of a given mixture, while the partitions forming the other series of pockets are impenetrable to both constituents of said mixture, combined with separate discharge-receptacles arranged at different elevations to receive the materials dropped from the respective series of pockets.



2. An elevating and separating wheel having two series of pockets formed in its interior by partitions arranged at different angles to the radii passing through them, combined with separate discharge-receptacles arranged at proper points to receive the materials dropped from the respective series of pockets.

3. An elevating and separating wheel having two series of pockets formed adjacent to its circumference by partitions, the partitions forming one series of pockets being penetrable to one constituent of a given mixture, while the partitions forming the other series of pockets are impenetrable to both constituents of said mixture, the partitions forming one series of pockets having a different angle of inclination to the wheel radii which pass through them from that which the partitions forming the other series of pockets have, combined with separate discharge-receptacles arranged at different elevations to receive the materials dropped from the respective series of pockets.

4. An elevating and separating wheel having two series of pockets formed within its rim by partitions, the partitions forming one series of pockets being imperforate, and those forming the second series being perforate, and placed one in advance of each one of the other series along the line of circumferential travel of the wheel, the partitions forming either one of said series of pockets being considerably inclined to the wheel radii passing through them, and those forming the other of said series of pockets being approximately parallel to the wheel radii passing through them.

5. An elevating and separating wheel having a series of water-tight pockets formed inside of its rim, and a series of perforate partitions placed in each pocket upon the bottom thereof and inclined toward the interior of said pocket.

6. An elevating and separating wheel having an annular space in its periphery divided into a series of buckets circumferentially disposed by a series of imperforate partitions, and a second series of perforated partitions overlying and separated from the first series of partitions.

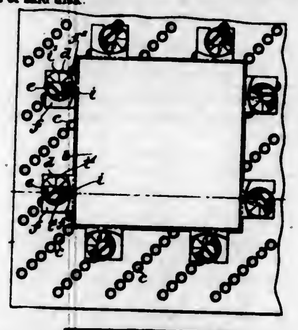
7. An elevating and separating wheel having an annular space in its periphery, divided into a series of buckets by imperforate partitions and each bucket carrying a perforated partition.

8. An elevating and separating wheel having an annular space in its periphery divided into a series of buckets by imperforate partitions and each bucket divided into two pockets by means of a perforated partition angularly disposed to the imperforate partition forming the bottom of the bucket.

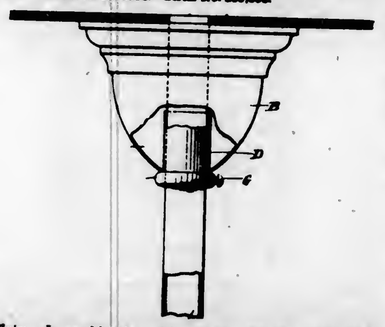
810,067. PLATE-HOLDER FOR PRINTING-PRESSES. HENRY A. MALEY, Boston, Mass. Filed Nov. 11, 1903. Serial No. 180,691.

Claim.—1. A clamp for a printing-press plate-holder, the same comprising a slotted flanged shoe formed to bear on a plate-holding bed, a disk formed to bear on the flange of said shoe and having an eccentric orifice, and a pivot-screw formed to pass through the orifice in the disk and the slotted shoe, the face of the flange of the shoe against which the disk bears being curved, substantially as and for the purpose set forth.

2. A clamp for a printing-press plate-holder, the same comprising a slotted shoe formed to bear on a plate-holding bed, said shoe having a top face or seat provided with a flange at one end substantially at right angles with the slot in the shoe, said flange having a curved face and an indicator on its top face, a disk formed to bear on said seat and provided with an eccentric orifice, the periphery of the disk bearing on the curved face of said flange, and a pivot engaged with said orifice and adapted to detachably engage said bed, said pivot passing through the slot in the shoe, said disk being also provided with a plurality of radial indicating members cooperating with the indicator on said flange, whereby various predetermined movements of the plate may be secured by a predetermined rotary movement of said disk.



810,068. CANOPY-SUPPORT AND CHANDELIER. JOSIAH O. MOSS, Goshen, Ind., assignor of two-fifths to Albert J. Berkey, Goshen, Ind. Filed Dec. 30, 1904. Serial No. 239,695.



Claim.—In combination with a central pipe of a chandelier, a canopy mounted thereon, and a ring made of rigid material and slidably mounted on said pipe and adapted to hold the canopy in position, the upper edge of said ring extended to form a sleeve and adapted to extend inside of the canopy an appreciable distance and form, with the lower end of the canopy, a pocket, substantially as shown and described.

810,069. OVERHEAD TROLLEY HARP AND SHOE FOR ELECTRIC RAILWAYS. JOHN MILLER, Jr., Amesbury, Mass., assignor to William H. Biddle, Amesbury, Mass. Filed Mar. 17, 1905. Renewed Dec. 12, 1905. Serial No. 292,102.

Claim.—1. An overhead device of the kind described, comprising a trolley-pole, a harp mounted thereon, a shoe pivoted between the arms of said harp, and having a hollowed-out contact-surface along its upper edge, and means for normally maintaining said shoe with its said contact-surface tipped upwardly at its rear end approximately in line with said trolley-pole.

2. An overhead device of the kind described, comprising a harp, a shoe pivoted intermediate its ends in said harp, and having a contact-groove along its upper edge, the side walls of said shoe extending rearwardly and upwardly beyond said groove at the rear end thereof for maintaining contact with the wire under abnormal conditions, and means for normally maintaining said shoe tipped upwardly at its rear end in longitudinal alinement with said harp.

3. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, said harp being provided with a stop for engaging said shoe and limiting its forward swinging movement.

4. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, said harp being provided with a stop for engaging said shoe and limiting its rearward swinging movement.

5. An overhead device of the kind described, comprising a trolley-pole, a harp at the upper end thereof, an elongated contact-shoe pivoted intermediate its ends between the arms of said harp, said shoe having a continuous arched contact-surface extending lengthwise thereof to its opposite ends, and means for normally tipping said elongated shoe lengthwise of said pole and harp, thereby extending said contact-surface lengthwise above said pole and harp to a greater distance than when pressed down in running engagement with the trolley-wire.

6. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, and means for normally swinging the rear end of said shoe upwardly.

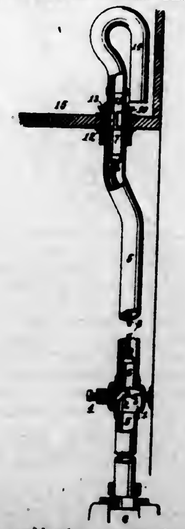
7. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, and a spring for normally swinging the rear end of said shoe upwardly.

8. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, and a leaf-spring engaging at one end the forward end of said shoe and at its other end engaging said harp.

9. An overhead device of the kind described, comprising a trolley-harp, and a shoe pivoted intermediate its length in said harp, said shoe having an antifriction-roller at the rear end of its contact-surface.

10. An overhead device of the kind described, comprising a trolley-harp, a shoe pivoted intermediate its length in said harp, said shoe having an antifriction-roller at the rear end of its contact-surface, and an antifriction-roller at the forward end of said contact-surface.

810,070. WATER-CLOSET FLUSH-PIPE. CHARLES H. MOORE, New York, N. Y. Filed Dec. 19, 1901. Serial No. 86,602.

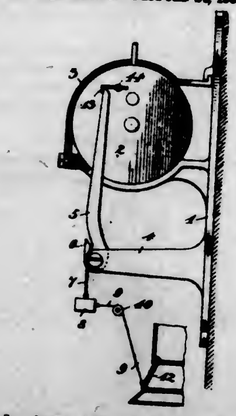


Claim.—1. In combination, a water-closet cistern having a valve-seat secured in the bottom, a cistern-valve on the valve-seat having a guide to conduct it to its seat, a passage for the escape of any accidental accumulation of water in the cistern when the cistern-

valve is closed, a flush-pipe connected to the cistern-valve seat and to a water-closet, slop-sink or the like and arranged to be empty except at times when the closet is being flushed, a rod and fitting in the flush-pipe operating in conjunction with a spindle and lever in the receptacle to lift the cistern-valve from its seat and having a certain amount of play between the cistern-valve and lever, a receptacle made separate from the flush-pipe and joined thereto, a cap or bonnet secured on an opening in the receptacle, a lever within the receptacle, and a spindle within a passage in the cap or bonnet whereby the lever in the receptacle is operated and lifts the cistern-valve from its seat and causes a continual outflow of water from the cistern after the lever has been operated and returned to its normal position, until the water contents of the said cistern are nearly exhausted.

2. In combination, a water-closet cistern having a valve-seat secured in the bottom, a cistern-valve on the valve-seat and having a guide to conduct it to its seat independent of the lifting-rod, a passage for the escape of any accidental accumulation of water in the cistern when the cistern-valve is closed, a flush-pipe connected to the cistern valve-seat and to a water-closet, slop-sink or the like and arranged to be empty, except at times when the closet is being flushed, a rod and fitting in the flush-pipe operating unconnectedly in conjunction with a spindle and lever in the receptacle to lift the cistern-valve from its seat, a receptacle made separate from the flush-pipe and joined thereto, a cap or bonnet secured on an opening in the receptacle, a lever within the receptacle, and a spindle within a passage in the cap or bonnet whereby the lever in the receptacle is operated and lifts the cistern-valve from its seat and causes a continual outflow of water from the cistern after the said lever has been operated and returned to its normal position, until the water contents of the said cistern are nearly exhausted.

810,071. DAMPER-OPERATING MECHANISM. CLAYTON MCPHERSON, Bridgeton, N. J. Filed Jan. 24, 1905. Serial No. 242,695.

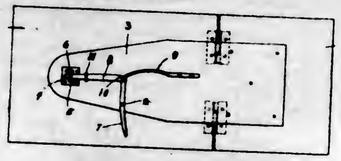


Claim.—In a device of the character described, the combination, with an alarm-clock, of a supporting-bracket, a lever mounted thereon, a hook formed on said lever, a weight, a loop or bail connected to said weight and supported by said hook, a latch-bar fixed on the alarm-winding shaft of said clock, and adapted to engage said lever and normally hold the same in position to support said weight until released by the alarm mechanism, and a cord connected with said weight and passing over a pulley, whereby the falling of the same when released from said lever will actuate other mechanism, substantially as described.

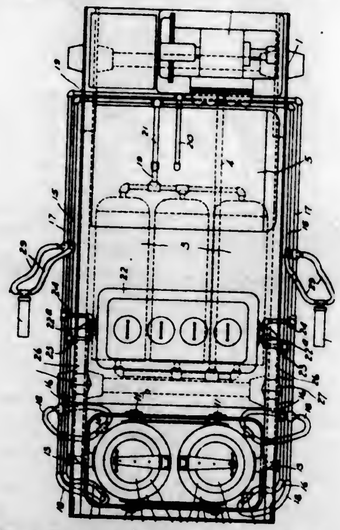
810,072. LOCK FOR BED-GATES. JAMES A. RIDDELLS, Sheffield, Ill., assignor to C. B. McCullough, Sheffield, Ill. Filed Sept. 30, 1905. Serial No. 280,256.

Claim.—1. In a device of the class named, the combination of the hand-lever 7, pivotally supported upon one part of the gate; the bolt 8, pivotally attached at its rear end to the upper end of the lever 7, and provided in its rear end with the notch 10; the spring 9, fixed in the rear of the bolt 8, and engaging the notch 10; means for guiding the bolt 8; and means for securing the free end of such bolt to the other part of the end-gate, substantially as shown and described.

2. In a device of the class named, the combination, with the parts 1 and 2 of an end-gate, of the leaf 3, fixed to the part 2, and provided in its free end with the opening 5; the keeper 6, fixed to the part 1, and engaging the hole 6; the bolt 8, suitably mounted on the leaf 3, and provided with the notch 10; the spring 9, in rear of the bolt 8, and engaging the notch 10; and means for suitably actuating the bolt 8, substantially as set forth.



810,073. PORTABLE MELTING AND HEATING APPARATUS. HENRY B. NICHOLS, Philadelphia, Pa. Filed July 19, 1904. Serial No. 217,293.



Claim.—1. In apparatus of the character described, the combination with a supporting vehicle, of a frame pivotally supported on said vehicle, a melting-pot or crucible pivotally supported in said frame, and means for heating said pot or crucible.

2. In apparatus of the character described, the combination with a supporting vehicle, of a frame supported by trunnions on said vehicle, and a melting-pot or crucible supported by trunnions in said frame, the last-named trunnions being arranged at right angles to those of the frame.

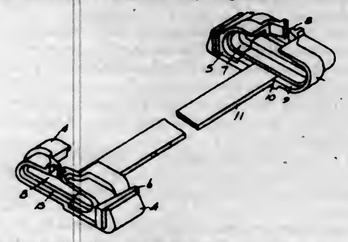
3. The combination with a supporting vehicle, of one or more melting-pots supported thereon, a ladle-heating stove adjacent to the said pot or pots, and a heat-conducting pipe or pipes leading from the combustion-chambers of said pot or pots to the said stove.

4. The combination with a supporting vehicle, of a melting-pot or crucible carried thereby and supported to maintain its vertical position, a ladle-heating stove also carried on the vehicle, and a jointed heat-conducting pipe leading from the combustion-chamber of the pot or crucible to the said stove.

810,074. DEVICE FOR USE IN THE MANUFACTURE OF RAIL-JOINTS. HENRY B. NICHOLS, Philadelphia, Pa. Filed July 19, 1904. Serial No. 217,292.

Claim.—1. The device for the purpose described, having end clamps arranged to fit around the joint-plates and rails, said clamps having damming portions which close the openings between the joint-plates and rails at the ends of the said plates and means for securing the same temporarily in place thereon.

2. The device for the purpose described, having end clamps arranged to fit around the joint-plates and rails, and having packing-seats, and means for securing said clamps in place.



3. The device for the purpose described, comprising two end clamps arranged to fit around the rails and the end portion of the joint-plates, and a bottom dam supported by the end clamps.

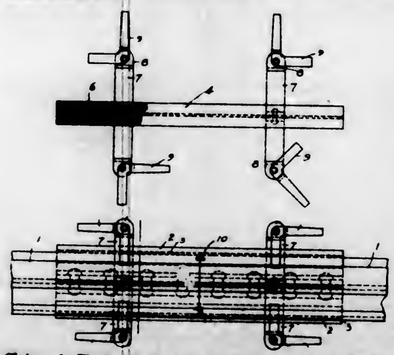
4. A device for use in the manufacture of railway-rail joints, comprising two clamping devices having each a movable jaw, and packing-seats, and a bottom dam supported by the clamping devices.

5. A clamp for use in the manufacture of railway-rail joints, said clamp having the movable jaw 5, the recess 7 to seat the end of the joint-plate, the opening 8 to pass the rail, and seats for packing or luting material.

6. A clamping and damming device for use in the manufacture of railway-rail joints, said device having the movable jaw 5, and means for securing and releasing the same, the recess to seat the end of the joint-plate, the opening 8 to pass the rail, and the seats 9 and 13 for packing or luting material.

7. A device for the purpose described, consisting of end clamps formed with damming portions for closing the openings between the joint-plates and rails at the ends of said plates, and a bottom damming-piece carried by the said end clamps.

810,075. DEVICE FOR USE IN THE MANUFACTURE OF RAIL-JOINTS. HENRY B. NICHOLS, Philadelphia, Pa. Filed July 19, 1904. Serial No. 217,294.



Claim.—1. The herein-described device for use in the formation of railway-rail joints, consisting of a dam arranged to seat over and close the longitudinal bottom opening between the base portions of joint-plates, and means for supporting said dam.

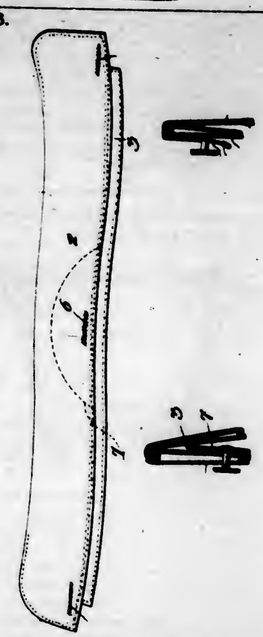
2. The herein-described device for use in the formation of railway-rail joints, consisting of an elongated bottom dam, carriers therefor, and securing devices on said carriers, and arranged to engage the joint to thereby hold the device in position.

3. The herein-described device for use in the formation of rail-joints, consisting of an elongated damming-strip having a refractory covering, carriers to which said strip is secured, and supporting devices pivoted to said carriers.

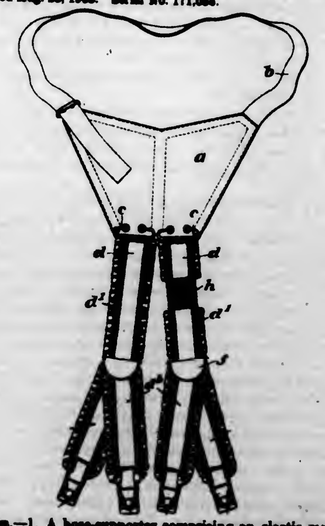
810,076. COLLAR. GUSTAV B. HOEHN, Detroit, Mich. Filed Sept. 15, 1904. Serial No. 224,982.

Claim.—A turn-down collar having a buttonhole at the rear in the neckband, and a tab on the neckband between the latter and the outer turned-down portion of the collar, covering the buttonhole and free at its upper edge, its lower edge being secured to the neckband.

810,076.



810,077. HOSE-SUPPORTER. JOHN D. O'BRIEN, Boston, Mass. Filed Aug. 23, 1905. Serial No. 275,088.



Claim.—1. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof and a second elastic member to preserve constant elasticity of said supporter.

2. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter and means to adjust said supporter between its extreme ends.

3. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member.

4. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member.

5. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection.

6. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings.

7. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings, and said connection having a plurality of openings.

8. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings, and said connection having a plurality of openings, and a pin to engage said openings.

810,078. HOSE-SUPPORTER. JOHN D. O'BRIEN, Boston, Mass. Filed Aug. 23, 1905. Serial No. 275,089.

Claim.—1. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection.

2. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings.

3. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings, and said connection having a plurality of openings.

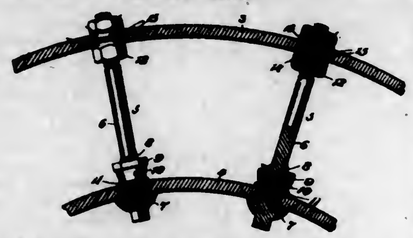
4. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic member, said means consisting of a connection between the ends of the elastic member and the supplemental supporting member, and a slide on said connection, said slide having a plurality of openings, and said connection having a plurality of openings, and a pin to engage said openings.

810,079. MANUFACTURE OF HORSESHOES. THOMAS [illegible]

4. A hose-supporter comprising an elastic member, a supplemental supporting member to limit the extension thereof, a plurality of elastic ends to preserve constant elasticity of the supporter, and means to adjust said elastic supporting members.

5. A hose-supporter comprising a waist-supported belt and a plurality of supporters attached to the front thereof, each comprising an elastic member having a plurality of constantly elastic supporting ends, and a supplemental supporting member with adjusting means for the purpose described.

810,078. STEAM-BOILER. ALFRED PARFITT, Topeka, Kans. Filed Mar. 29, 1905. Serial No. 251,009.



Claim.—1. In a boiler, the combinaton with a shell-sheet, of a fire-box crown-sheet, a radial stay-bolt connecting the sheets and having a head that fits against the inner face of the crown-sheet, said bolt having a shank, that portion of which that is adjacent to the head being threaded and screwed into the crown-sheet, said shank having its outer end connected to the shell-sheet, and a nut screwed upon the threaded portion of the shank and having a tapered inner end that coacts with the outer face of the crown-sheet.

2. In a boiler, the combination with spaced sheets, of a shank connected to one of the sheets and passing through the other, and clamping devices mounted on the shank and having tapered opposing faces that coact with the opposite faces of said other sheet.

3. In a boiler, the combination with spaced sheets, of a shank connected to one of the sheets and passing through the other, said other sheet having its faces recessed about the shank, and clamping devices mounted on the shank and having tapered opposing faces that fit in the said recesses.

4. In a boiler, the combination with spaced sheets, of a shank connected to one of the sheets and passing through the other, and clamping devices adjustably mounted on the shank and having rounded opposing faces that coact with the faces of said other sheet about the shank.

5. In a boiler, the combination with spaced sheets, of a shank connected to one of the sheets and having a threaded outer end passing through the other sheet, said other sheet having its faces recessed about the shank, and clamping-nuts screwed upon the threaded portions of the shank on opposite sides of said other sheet and having rounded faces that fit in the recessed portions of said sheet.

6. In a boiler, the combination with a shell-sheet, of a fire-box crown-sheet, a radial stay-bolt having threaded inner and outer portions that pass through the sheets, a head on the inner end of the shank bearing against the inner face of the crown-sheet, a nut threaded on the inner portion of the shank and having a tapered end that coacts with the outer face of the crown-sheet, and nuts threaded on the outer portion of the shank on opposite sides of the shell-sheet and having their opposing faces rounded, said shell-sheet being recessed about the shank to receive the rounded faces of the nuts.

7. In a boiler, the combination with spaced sheets, one of said sheets having a portion thinner than the surrounding portions of the same sheet, of a stay-bolt connecting the spaced sheets, said bolt engaging the said thinner portion of the one sheet and being spaced from the thicker surrounding portions of the same, said thinner portion bending or buckling to permit the relative expansion and contraction of the sheets.

8. In a boiler, the combination with spaced sheets, one of said sheets comprising sections arranged flat against each other and one of said sections being thinner than the other, of a connection between the spaced sheets, said connection being engaged with the thinner section and spaced from the thicker section and said thinner section bending or buckling to permit the relative expansion and contraction of the sheets.

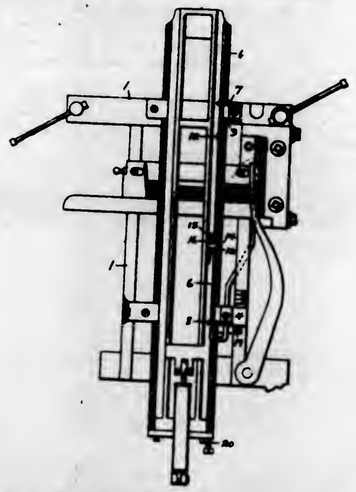
9. In a boiler, the combination with spaced sheets, one of said sheets comprising overlying sheet-sections located flat upon each other, of a connection between the spaced sheets, said connection being free from the inner sheet-section and engaged with the outer sheet-section.

10. In a boiler, the combination with a crown-sheet, of a comparatively thick shell-sheet having openings therethrough, a supplemental sheet-section secured thereupon and extending over a plurality of the openings, a fire-box sheet, and a plurality of stay-bolts engaged at their inner ends with the fire-box sheet, said stay-bolts passing through the openings of the shell-sheet and being engaged with the supplemental sheet.

11. In a boiler, the combination with inner and outer sheets, of a stay-bolt connecting the sheets, a sleeve fitted upon the bolt and bearing against one of the sheets, and a nut threaded upon the intermediate portion of the bolt between and in spaced relation to the sheets, said nut bearing against the inner end of the sleeve to force the outer end of the same against the sheet.

12. In a boiler, the combination with inner and outer sheets, of a stay-bolt connecting the sheets, a sleeve fitted upon the bolt and having a tapered end that bears against one of the sheets, and a nut threaded upon the bolt and bearing against the sleeve to force the tapered end thereof against the sheet.

810,079. KNIFE-WIPER FOR LINOTYPES. FRANK A. PETTIT, Kansas City, Mo. Filed Apr. 6, 1905. Serial No. 254,126.



Claim.—1. In a linotype-machine, in combination with the first elevator, a vertically-movable knife-wiper rod, a knife-wiper, and means, carried by said elevator, and controllable by the operator, for raising the stroke of the knife-wiper when recasting mixed five-inch slugs; substantially as described.

2. In a linotype-machine, in combination with the first elevator, a vertically-movable knife-wiper rod, a knife-wiper, two projections carried by said rod, a pawl carried by the elevator and movable by the operator, for engaging the upper projection and lifting said wiper-rod to a greater or less height; substantially as described.

3. In a linotype-machine, in combination with the first elevator, a vertically-movable knife-wiper rod, a knife-wiper, guides for said rod, said guides being stationary with respect to the elevator, an upper collar and a lower collar fixed upon said rod, a bracket carried by the elevator and adapted to depress the lower collar, and a pawl pivoted on said bracket and capable of lifting the upper collar to a greater or less height, depending on the position of the pawl; substantially as described.

4. In a linotype-machine, in combination with the front trimming-knives; a knife-wiper having a portion 16 which engages the edges of the knives, and having a bent portion 16^a which touches the outer face of one of the knives; substantially as described.

5. In a linotype-machine, in combination with the front trimming-knives, a knife-wiper having a bent portion 16^a which touches the outer face of one of the knives, and having a downwardly-projecting portion 16^b; substantially as described.

810,080. MANUFACTURE OF HORSESHOES. WILLIAM PELLINGTON, Bridgtoo, England. Filed Oct. 26, 1901. Serial No. 79,891.

Claim.—The herein-described process for the manufacture of horseshoes with cushion cavities, which consists in bending a bar to a horseshoe shape, forming laterally-projecting flanges along the edges of the bar, shaping the said flanges to be thicker along their outer edges than their inner, and bending the said flanges to have their inner walls converge outwardly by pressing the bar through a perforated tool, substantially as set forth.

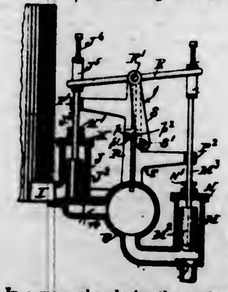
810,081. KEY-HOLDER. ROBERT H. PIPER, Waterbury, Conn. Filed Oct. 26, 1904. Serial No. 229,903.

Claim.—1. The key-ring comprising a disk, the edge of which is formed with a circumferential groove, a ring-section fitting in said groove, the ends of said ring-section being bent back in opposite directions, parallel with said ring-sections, the integral curved members terminating in eyes which contact with each other, and the ring-section, as set forth.

2. A key-ring comprising an inner ring-section, the opposing ends of which are bent back in opposite directions parallel with said ring, the integral curved members terminating in eyes which contact with each other and with the inner ring-section.

3. The key-ring comprising a disk, a ring-section of wire embracing said disk, the ends of said ring-section being bent back in opposite directions, the integral curved members terminating in eyes which contact with the ring, said curved members being parallel with the inner ring-section, as set forth.

810,082. MEASURING DEVICE. HENRY RAAB and JACOB M. WOLFSON, New York, N. Y. Filed Aug. 21, 1905. Serial No. 275,077.



Claim.—1. In a measuring device the combination of a cylinder, a piston therein, means to move the piston, means to indicate the position of the piston, an inlet-valve chamber and an outlet-valve chamber connected with the cylinder, a valve in each chamber, a valve-spindle extending from each valve, a loop connected to each valve-spindle, a beam journaled adjacent to the cylinder and having its ends extending through the loops of the valve-spindles, and means to move the said beam.

2. In a measuring device the combination of a cylinder, a piston therein, means to move the piston, means to indicate the position of the piston, an inlet-valve chamber and an outlet-valve chamber connected with the cylinder, a valve in each chamber, a valve-spindle extending from each valve, a loop connected to each valve-spindle, a beam journaled adjacent to the cylinder and having its ends extending through the loops of the valve-spindles, and means connected with each loop to bear against the said beam and raise the said valves.

3. In a measuring device the combination of a cylinder, a piston therein, means to move the piston, means to indicate the position of the piston, an inlet-valve chamber and an outlet-valve chamber connected with the cylinder, a valve in each chamber, a valve-spindle extending from each valve, a loop connected to each valve-spindle, a beam journaled adjacent to the cylinder and having its ends extending through the loops of the valve-spindles, a screw threaded through each loop, arranged to bear against the beam and thereby raise the valves.

4. In a measuring device the combination of a cylinder, a piston therein, means to move the piston to various positions, means to indicate the position of the piston, an inlet-valve chamber and an outlet-valve chamber connected with the cylinder, a valve in each chamber, a stem for each valve, and a loop extending from each stem, a bracket extending from the cylinder, a journal-bearing supported on the bracket, a shaft in the bearing, a beam supported on the shaft, the ends of the beam engaging the said loops, a vent-pipe extending from the cylinder, a vent-valve connected with the vent-pipe, an arm extending from the shaft to move the same, a second arm connected to the shaft, and a connection between the second arm and the vent-valve.

5. In a measuring device the combination of a cylinder, a piston therein, means to move the piston to various positions, means to indicate the position of the piston, an inlet-valve chamber and an outlet-valve chamber connected with the cylinder, a valve in each chamber, a stem for each valve, and a loop extending from each stem, a bracket extending from the cylinder, a journal-bearing supported on the bracket, a shaft in the bearing, a beam supported on the shaft, the ends of the beam engaging the said loops, a vent-pipe extending from the cylinder, a vent-valve connected with the vent-pipe, an arm extending from the shaft to move the same, means to lock the arm in different positions, a second arm connected to the shaft, and a connection between the second arm and the vent-valve.

6. The combination of a reservoir, a conduit extending therefrom, an inlet-valve chamber connected with the conduit, a conduit leading from the inlet-valve chamber, a cylinder connected with the latter conduit, a piston in the cylinder, means to move the piston to various positions, means to clamp the piston in place, an indicator adjacent to the piston to indicate its position, a conduit leading from the cylinder, an outlet-valve chamber connected with the latter conduit, a bracket extending from the cylinder, a shaft journaled on the bracket, a beam secured to the shaft, an arm fastened to the shaft, a handle on the arm, a spring-latch connected to the handle to clamp the arm in different positions, a second arm extending from the shaft, a vent-valve having a through-port and a cross-port connected with the cylinder, a connection between the second arm and the vent-valve, a valve in each valve-chamber, and a spindle for each valve arranged to engage with the beam.

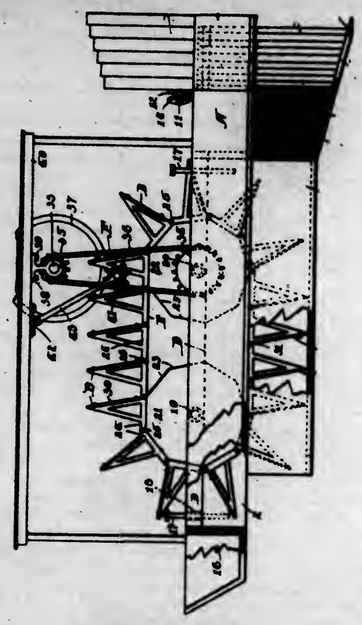
810,083. CURRENT-MOTOR. JOHN RAUSCHER, St. Paul, Minn. Filed Mar. 22, 1904. Serial No. 199,488.

Claim.—1. A device of the class set forth, consisting of a boat, an opening in said boat, a trough below said opening, the mouth of which has sides and a floor which flares downwardly, vertical shutters sliding in the bow of the boat to close the mouth of said trough, a rack on each shutter, a shaft adjoining said shutters, a shifting pinion feathered on said shaft and adapted to engage the racks on the shutters, means for turning said shaft, and dog mechanism back of said racks.

2. A device of the class set forth, consisting of a boat, an opening in said boat, a trough below said opening, a mouth at one end of said trough, means for modifying the size of said mouth, wheels in said opening, a wall surrounding said opening, a shifting frame, on said wall, on which said wheels are journaled, means for permitting said frame to rise vertically, chains passing around the peripheries of said wheels, each link of which consists of a bar having a split end admitting the opposite end of the corresponding link, a pivot through the connecting ends of said links and a bracket on each bar, paddles attached to said brackets in inclined position and corresponding substantially in width and length with the transverse dimensions of said trough, transverse brace-rods between said links, power-transmitting mechanism connected with said wheels, and means for taking up the slack of said mechanism when the frame on which the wheels are journaled moves upward.

3. A device of the class set forth, consisting of a boat, an opening in said boat, a trough below said opening, wheels in said opening, chains carried by said wheels, each link of said chain consisting of a bar, pivot connections at each end of said bar and a bracket on each bar, a paddle attached to the brackets of each pair of links in in-

ained position and agreeing in width and length with the transverse dimensions of said trough, transverse brace-rods between each pair of links, and power-transmitting mechanism connected with said wheels.



810,084. NUT-LOCK. HARRY R. ROSENBERG, Winona, Minn. Filed Sept. 21, 1905. Serial No. 279,445.

Claim.—1. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension, said strip being recessed to permit overlapping of the coils of said spiral, substantially as described.

2. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension at one end, said strip being recessed to permit overlapping of the coils of said spiral, substantially as described.

3. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension, said strip being recessed to permit overlapping of the coils of said spiral, and a spring-dog carried by said spiral, substantially as described.

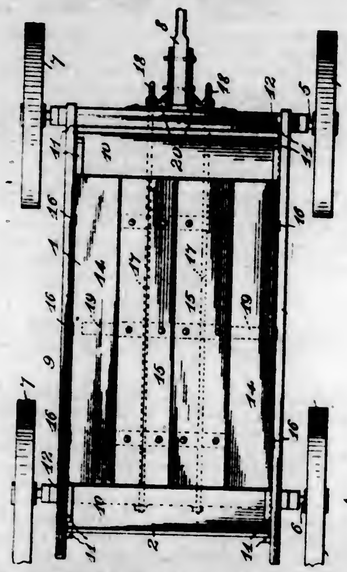
4. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension projecting beyond said spiral, said strip being recessed at the intersection of said extension with the coil of the spiral to permit overlapping of the coils of said spiral, substantially as described.

5. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension, said strip being provided with interlocking recesses to lock the spiral against distortion and unwinding, substantially as described.

6. A nut-lock comprising a spiral strip of resilient metal provided with a securing extension at one end, said extension and spiral being provided with interlocking recesses at their intersection to permit overlapping of the coils of said spiral and to lock said spiral against distortion and unwinding, substantially as described.

7. A nut-lock comprising a spiral strip of resilient metal adapted to be applied around a bolt between the nut and the part clamped, said strip being recessed to permit overlapping of the coils of said spiral, whereby said coils provide a spring-seat against diametrically opposite portions of the nut, and a spring-dog extending from the spiral above the plane of such spring-seat, substantially as described.

810,085. DUMPING-WAGON. DAVID M. ROWE, Oglesby, Ill. Filed Aug. 7, 1905. Serial No. 272,154.



Claim.—1. A dumping-wagon comprising a body, a section hinged to one side of the same, a shaft, a section secured upon said shaft, an arm upon the last-mentioned section adapted to engage said hinged section to elevate and support the same, and means for operating said shaft, substantially as described.

2. A dumping-wagon comprising a body, a section hinged to one side of the same, a shaft, a section secured upon said shaft, an arm upon the last-mentioned section adapted to engage said hinged section to elevate and support the same, a lever secured upon said shaft and a latch for locking said lever, substantially as described.

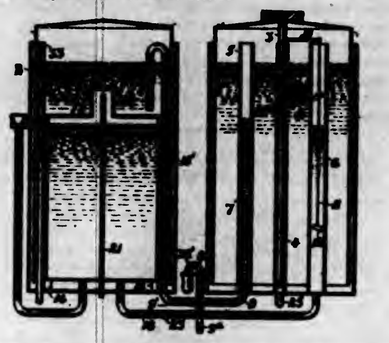
3. A dumping-wagon comprising a body consisting of two parallel sides, two inclined ends, two outer bottom sections hinged to said sides, parallel shafts, intermediate bottom sections secured upon said shafts, arms upon said intermediate sections adapted to engage said outer sections to elevate and support the same, levers upon the forward ends of said shafts and locking devices for said levers, substantially as described.

810,086. ART OF MAKING STARCH. WILLIAM F. RUDEL, Aurora, Ind., assignor to Albert T. Gridley, Aurora, Ind. Filed Feb. 15, 1905. Serial No. 245,699.

Claim.—1. In the manufacture of chemical starch from corn, adding to the milk or liquor after it is separated from the hulls caustic soda until the liquor will titrate about twelve ten-thousandths ($\frac{12}{10000}$), then after the starch has been separated from the gluten and settled upon the runs, placing it in the washing-tubs, bringing it again to the liquid state and again adding caustic soda to the liquor until it titrates about thirty ten-thousandths ($\frac{30}{10000}$) and finally removing it from the ovens when the caustic soda in the lumps has been reduced to not more than five ten-thousandths ($\frac{5}{10000}$), substantially as hereinbefore set forth.

2. The method, substantially as herein described, for manufacturing starch from corn, which consists of the following steps: First steeping the corn in hot water at a temperature of from 150° to 160° Fahrenheit, then grinding the corn and separating the hulls from the milk, then adding caustic soda to the milk until it titrates about twelve ten-thousandths ($\frac{12}{10000}$), passing the milk so saturated over the runs to separate the starch from the slop and gluten, then placing the settled starch in the washing-tubs, adding sufficient water to bring it to the liquid state and again adding caustic soda until the fluid titrates about thirty ten-thousandths ($\frac{30}{10000}$), then running the liquor into settling-boxes and allowing it to settle for twelve hours or until it is ready for the crusting-room.

810,087. CARBURETER. STEPHEN P. SANDERS, Cupertino, Cal. Filed May 10, 1905. Serial No. 259,733.



Claim.—1. A carbureting-machine having in combination two water-containing tanks, a bell in each tank, a receptacle submerged in one of said tanks and containing a liquid hydrocarbon, two tubes fixed to the bottom of the other tank and rising above the water-level thereof, one of said tubes containing an absorbent filling, means connecting the hydrocarbon-receptacle of the one tank with one of the tubes of the other tank, an air-supply connecting with the tube containing the filling, a pivotally-mounted bucket suspended from the bell and operatable in the tube which receives the hydrocarbon from the receptacle, a pipe connection between the two tubes, and means whereby on the raising of the bell the bucket is elevated to deliver its charge of hydrocarbon into the pipe connection for saturating the filling of the other tube, said bell, in its descent, forcing the carbureted air out of said filled tube, and means conducting the carbureted air to the bell of the other tank.

2. In a gas-machine the combination of a water-containing tank, a bell therein, a carbureter comprising a tube fixed in the tank and provided with an absorbent filling, said tube opening into the top of the bell, a second tube in said tank and means for delivering hydrocarbon to said second tube, a transverse connection between the two tubes, and means including a pivotally-suspended bucket operatable in the hydrocarbon and connected with the bell, for delivering predetermined quantities of liquid from the second tube into the first tube above the filling thereof.

3. In a gas-machine, the combination of a source of liquid-hydrocarbon supply, a gas-receiver, a tank to contain water, a bell in said tank, a carbureter in the tank and discharging into the bell, said carbureter comprising a tube submerged in the tank and containing an absorbent filling, said tube having its upper end open, means for delivering predetermined quantities of liquid from said source of supply into the carbureter, said delivery means including a pivotally-suspended bucket operatable in the hydrocarbon and connected with the bell, means whereby on the lifting of the bell a charge of air is drawn thereinto and through the carbureter, and connections between the interior of the bell and said receiver and through the carbureter whereby on the falling of the bell the air previously drawn thereinto is made to pass again through the carbureter.

4. A carbureting-machine having in combination two water-tanks placed side by side, a receiver for liquid hydrocarbon submerged in one of said tanks, two open-ended tubes fixed in the other tank and substantially submerged therein, and extending above the water-level thereof, one of said tubes containing a filling of absorbent material, and the other tube connecting with and adapted to hold liquid hydrocarbon, a bell for each tank, a tiltable bucket operatable in the liquid-holding tube and connected to move with the bell of that tank, a pipe forming a transverse connection between the two tubes and into which pipe the bucket empties its charge at intervals, means for vaporizing the liquid delivered to the tube containing the filling, and means for delivering the carbureted air to the bell of the other tank.

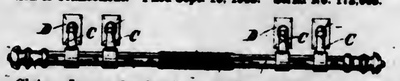
5. In a gas-machine, the combination of a carbureter having an absorbent filling, a carbureted-air receiver, connections between the carbureter and receiver means for delivering a predetermined quantity of liquid into said carbureter, said means including a tubular hydrocarbon-receiver being ovoidal in cross-section and a tubular bucket closed at one end and open at the other end and operable therein to make periodic delivery of hydrocarbon to the carbureter, and means for inducing a current of air through said carbureter in one direction and for returning the same through the carbureter in an opposite direction to the receiver.

6. In a gas-machine, the combination of a water-tank, a bell therein, a carbureter in the tank and opening into the top of the bell, a gas-receiver connected with the carbureter, an oil-well in the tank, means for delivering liquid into said well, means operated by the bell to discharge the quantity of liquid from the well into the carbureter, said last-named means including a pipe connecting the oil-well with the carbureter, a suspended bucket operatable in the oil-well and tiltable to discharge into said connecting-pipe, and means connecting the bucket with the bell, connections between the carbureter and a source of air-supply, means for lifting the bell to induce a current of air through the carbureter and means to permit the bell to fall to expel the air so induced, through the carbureter.

7. In a gas-machine, a carbureter, a gas-receiver connected therewith, an oil-well connected with a source of supply, connections between the well and carbureter above the normal level of the liquid in the well, means for alternately creating suction and compression in the carbureter, and means operated by said suction and compression means for delivering a predetermined quantity of liquid from said well into the carbureter, said last-named means including a bucket connected to move with the bell and operatable in the oil-well, said bucket being tiltably mounted whereby it automatically discharges into the connection between said well and carbureter.

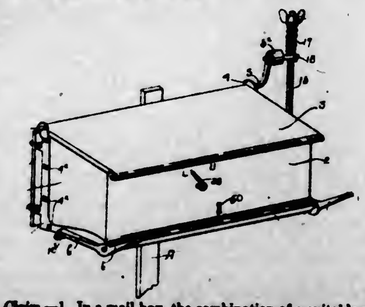
8. In gas-machine construction, the combination of a tank, a bell therein, a carbureter, a receiver connected with the carbureter, means to reciprocate the bell, an oil-well connected with the carbureter and means to deliver a predetermined quantity of liquid into said carbureter, said well being of greater diameter in one direction than in the other and said means for delivering liquid from said well into the carbureter including an elongated bucket supported intermediate of its ends and suspended from the bell, and trip means in the path of the bucket to effect its discharge.

810,088. CASKET-HANDLE. EDWARD R. SARGENT, New Haven, Conn., assignor to Sargent & Company, New Haven, Conn., a Corporation of Connecticut. Filed Sept. 10, 1903. Serial No. 172,663.



Claim.—In a casket-handle or similar article, the combination with a core or bar; of a series of tubes of substantially the same diameter extending in succession on said core or bar; a sleeve on said bar or core overlapping the extremities of adjoining tubes; and arms secured to said tubes, said core or bar extending from one arm to the other, whereby said handle may be elongated by separating the ends of adjoining tubes without disclosing said bar or core, substantially as described.

810,089. MAIL-BOX. EDWARD G. SEABOLDT, Sunbury, Pa. Filed Aug. 26, 1905. Serial No. 276,086.



Claim.—1. In a mail-box, the combination of a suitable mounting-board, a body portion, a lid fitted thereto, a pivotally-mounted bottom, and bearing-plates adapted to secure said lid to the body portion thereof and to secure said body portion to the mounting-board.

2. In a mail deposit and delivery box, the combination of a body portion, a lid secured thereto, a bottom mounted on a longitudinal axis eccentrically of the width of said bottom, said axis being journaled in bearing-plates secured to the body portion and means connecting said bottom to said lid, substantially as described.

3. In a mail deposit and delivery box, the combination of a body portion, a lid therefor, a bottom mounted eccentrically of the width thereof and adapted to swing into a vertical position, and means connecting said bottom with said lid, so adapted that the closing of said lid will move said bottom into the closed position.

4. In a mail deposit and delivery box, the combination of a body portion, a bottom therefor adapted to be swung along a longitudinal axis, said bottom being of a different color from the body portion and automatically-operating means for securing and retaining said bottom in its closed position.

5. In a mail deposit and delivery box, the combination of a body portion, a lid therefor, a bottom mounted on a longitudinal axis eccentrically of the width, means connecting said bottom with the lid, said means consisting of a crank secured to the axis of the bottom, a rod pivoted at one end to said crank and the other end slidably connected with the lid, and so adapted that the bottom may be swung into an open position without opening said lid, substantially as described.

6. In a mail-box, the combination of a body portion, a lid with means thereon for securing the same by a locking member, said locking member being secured within the body portion and on the walls thereof, a bottom mounted on a longitudinal axis, independent means for supporting said bottom in a closed position, said supporting means adapted to be locked when said locking member is in the locking position, substantially as described.

7. In a mail-box the combination of a body portion, a locking-lever adapted to slide in brackets and fitted with a spring tending to return said locking-lever to the locking position, a bottom fitted to said body portion, means for placing same in a depending position, means for supporting said bottom in a closed position, said means adapted to be operable only when the locking-lever is in the unlocked position, substantially as described.

8. In a mail deposit and delivery box, the combination of a body portion, a bottom colored differently from the body portion mounted on a longitudinal axis eccentrically of the width and adapted to be swung for a signal, means for supporting said bottom in a closed position, said means consisting of a bar mounted in the bearing-plates, said bar being arranged to be rocked and adapted to be returned to its normal position and to be held there by an arm mounted thereon eccentrically.

9. In a mail-box, the combination of a locking-lever on the walls thereof, a plate attached thereto and adapted to engage a suitable shoulder when said locking-lever is in its unlocked position, to render said locking-lever impossible of locking the lid of said box, and a supporting means for the bottom thereof.

10. In a mail-box, the combination of a body portion, a lid, a bottom arranged to be swung on a longitudinal axis, a locking-lever slidably secured to the body portion, a plate attached to said lever and arranged to swing into the path of the bottom when said bottom is opened, and adapted to disengage the locking-lever when said bottom is swung into the closed position, substantially as set forth.

11. In a mail-box, the combination of a body portion, a locking-lever slidably arranged in grooves in brackets secured to the walls thereof, shoulders on said lever to hold the same in position and means whereby said shoulders are held in engagement with said grooves, and a spring fitted to said lever operating to slide said lever into the locking position whenever said shoulders are disengaged.

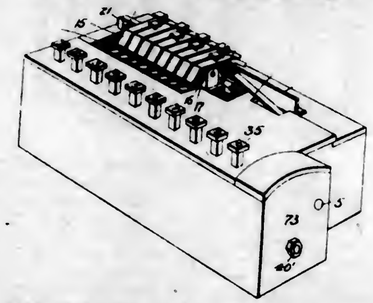
12. In a mail-box, the combination of a body portion, a lid fitted thereto, a shaft, a locking-lever secured to the walls of said body portion, said lever being slidable and connected by a suitable rod to an arm on said shaft, said shaft having fixed thereto a pointer arranged on the outside of the walls of the box and adapted to indicate by suitable symbols the position of said locking-lever.

13. In a mail deposit and delivery box, the combination of a body portion, a lid fitted with means for being locked, said means being slidable and actuated by a spring to insure engagement with the locking-lever in its locking position, a bottom mounted to swing on a longitudinal axis eccentrically of the width, a crank on said axis, a rod connecting the crank on said longitudinal axis with the lid in a slidable connection by means of an eyebolt, said eyebolt arranged to work against the spring on said rod, and a nut on said rod whereby the force of said spring may be adjusted.

14. In a mail-box, the combination of a body portion, a rod having a crank at one end thereof, a lid hinged on said rod, a bottom adapted to swing into a depending position and serve as a signal, means connecting said bottom with the lid, whereby the closing of the lid will also close the open bottom, and so adapted that the bottom may be swung open independently of the closed lid, substantially as set forth.

15. In a mail deposit and delivery box, the combination of a body portion, a bottom-supporting bar, a locking-lever secured on the front wall thereof and within the box, said lever adapted simultaneously to lock the lid and the bottom-supporting bar, said lever carrying a plate arranged to be positioned in the path of the open bottom and adapted to disengage the locking-lever from its unlocking position, when the bottom is brought into the closed position, and thus simultaneously lock the lid and the bottom, substantially as described.

810,090. CALCULATING-MACHINE. JOHN M. SHARP, Chattanooga, Tenn. Filed Apr. 28, 1904. Serial No. 205,862.



Claim.—1. In combination in a calculating-machine, a series of number-wheels, a carrier therefor spring means for moving the carrier in one direction, order-keys controlling the said means, a device for moving the carrier positively in the opposite direction digit-keys and connections therefrom for turning the number-wheels and for operating the said devices, substantially as described.

2. In combination in a calculating-machine, a series of number-wheels, a shifting carrier therefor, said number-wheels having internal teeth, a setting or turning device to engage said internal teeth and hold against movement axially of the number-wheels, order-keys with means controlled thereby for moving the carrier to bring the number-wheel of the desired order to engage the setting device and digit-keys with connections therefrom to the turning or setting device to turn the number-wheel to expose the desired digit, said connections including an adjustable part whereby the machine may be made to add or subtract, substantially as described.

3. In combination in a calculating-machine, a series of number-wheels, a shifting carrier therefor, said number-wheels having internal teeth, a setting or turning device to engage with said internal teeth, order-keys with means controlled thereby for moving the carrier to bring the number-wheel of the desired order to engage the setting device and digit-keys with connections therefrom to the turning or setting device to turn the number-wheel to expose the desired digit, substantially as described.

4. In combination in a calculating-machine, a series of number-wheels having internal teeth, a carrier for the number-wheels a turning or setting device to engage the internal teeth, order-keys with means controlled thereby for shifting the carrier to bring the desired number-wheel to engage the setting device, digit-keys with connections to the setting device for operating the same and means controlled by the operation of the digit-keys for shifting the carrier one step for each operation, to cause the number-wheels to successively engage the setting device, substantially as described.

5. In combination in a calculating-machine, a series of number-wheels, one for each order of digits, a shifting carrier therefor, a rotary shaft along which the carrier shifts, said shaft having associated therewith a number-wheel-setting device order-keys with means for arresting the carrier to correspond with the order-key operated and digit-keys with connections to said shaft for turning the number-wheels, substantially as described.

6. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, said wheels having internal teeth, a shaft passing through the number-wheels and along which the group of number-wheels may shift, a setting device comprising a pin or projection associated with the said shaft and adapted to engage the internal teeth of the number-wheels; order-keys with means associated therewith for setting the number-wheel of the desired order into engagement with the said pin and digit-keys for turning the said shaft with the pin and thus turning the number-wheel to expose the digit desired, substantially as described.

7. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, a series of order-keys each arranged to act as a stop, spring-controlled escapement mechanism for operating the carrier, a band arranged to be pressed by the order-keys for operating the escapement, a setting or turning device for the number-wheels to which they are brought by the movement of the carrier and digit-keys with connections to the said setting or turning device, substantially as described.

8. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, order-keys on the carrier, a stop on the frame, arranged to be struck by any order-key when depressed spring-pressed escapement mechanism for operating the carrier, a band controlling the same arranged to be operated by the depression of an order-key, a turning or setting device for the number-wheels, digit-keys and connections therefrom to the turning or setting device, substantially as described.

9. In combination in a calculating-machine, a series of number-wheels, a carrier therefor said wheels having internal teeth, a turning or setting device for engaging the internal teeth an escapement mechanism for moving the carrier order-keys controlling the escapement, stop means, digit-keys connections therefrom to the setting device, and means for operating the carrier from the digit-keys comprising a pawl to act on a part of the escapement, and a lever-plate operated by any one of the digit-keys and serving to set the pawl ready to act said pawl having a spring to move it when the digit-key is released, substantially as described.

10. In combination in a calculating-machine for addition and subtraction, a series of number-wheels a carrier therefor, said wheels having internal teeth, a setting device to which the carrier moves the wheels consisting of a pin or projection to engage the said internal teeth, rotary means carrying the said pin, digit-keys and connections therefrom for operating the said pin-carrying means circumferentially in either direction, to rotate the pin in either direction to turn the number-wheels for addition or subtraction, substantially as described.

11. In combination in a calculating-machine, a series of number-wheels internally toothed, a sleeve along which the series of wheels may slide, a pin on said sleeve to engage the internal teeth, a shaft passing through the said sleeve digit-keys, connections therefrom for driving the shaft in either one direction or the other and means for transmitting the movement of the shaft to the sleeve, substantially as described.

12. In combination in a calculating-machine, a series of number-wheels, a carrier therefor said number-wheels having internal teeth a sleeve having a pin thereon to engage the internal teeth of the number-wheels a shaft passing through the said sleeve and movable longitudinally, a pinion on the said shaft, adding and subtracting toothed segments with either of which the said pinion may be engaged by shifting the shaft, digit-keys and means for operating the segments therefrom, substantially as described.

13. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, said number-wheels having internal teeth, a sleeve, a pin thereon to engage the internal teeth, a shaft passing through the sleeve, digit-keys with means for driving the shaft in either direction from the said digit-keys and pawl-and-ratchet mechanism between the shaft and sleeve, substantially as described.

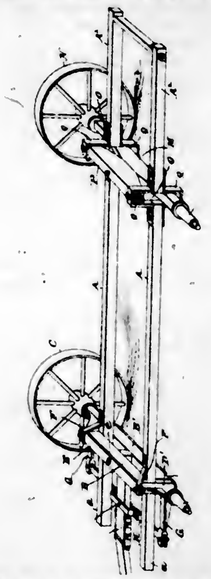
14. In combination in a calculating-machine, a series of number-wheels a carrier therefor, said wheels having internal gear-teeth, a sleeve having a pin to engage said gear-teeth a shaft within the sleeve arranged to be shifted longitudinally digit-keys, means for turning the shaft from the digit-keys in either one direction or the other according to the longitudinal position of the shaft and a screw-threaded head on the said shaft with a handle for turning the same said head turning in a fixed part to move the shaft longitudinally, substantially as described.

15. In combination in a calculating-machine, a series of number-wheels, a turning or setting device therefor, digit-keys for operating the said turning device, a carrier for the number-wheels, connections for moving the said carrier from the digit-keys and a key-lock arranged to be controlled by the operation of the said connections, substantially as described.

16. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, digit-keys, connections for operating the carrier from the digit-keys comprising the lever-plate arranged below the keys to be operated thereby, and a key-lock comprising a pivoted frame held normally away from the keys when the lever-plate is in its upper position, substantially as described.

17. In combination in a machine of the class described, a series of vertically-extending keys, a number-wheel carriage, a lever with means between the same and the number-wheel carriage for operating it, said lever being arranged to be depressed by the keys, a key-lock, and springs for holding the unoperated keys up until the lock is set, said springs being normally compressed by the lever when in its uppermost position, substantially as described.

810,091. VEHICLE-TRUCK. WILLIAM H. SPRINGER, Peoria, Ill., assignor to Avery Manufacturing Company, Peoria, Ill., a Corporation of Illinois. Filed Apr. 4, 1903. Serial No. 151,126.



Claim.—1. The herein-described truck for threshing and separating mechanism, consisting of the combination of the rear wheels and axle, the front-axle beams, the side-sill bars A A adapted to support the thresher-frame and extending across the front-axle beams to points in front thereof, the support for the threshing-cylinder connected to the side sills at points in front of the front axle and at points in rear thereof, the front wheels in the transverse line of the said front-axle beams, the vertical hinges for the wheels, the lever-bars connected with the wheel-spindles, and the laterally-swinging draft devices connected with the said lever-arms, substantially as set forth.

2. In a truck for a threshing and separating mechanism, the combination of the bottom side sills A A adapted to support the threshing-cylinder, its supporting-frame and the band-cutting and feeding apparatus secured to and projecting forward from said frame and extending continuously from the cylinder-supporting framework backward to the rear axle, the front-axle beams situated on transverse lines behind the front ends of the said sills A A, the front wheels intersecting the horizontal planes of the said sills A A, the short stub axles or spindles for said front wheels hinged on vertical axes, the lever-arms connected to said stub-spindles, the laterally and vertically vibratable tongue and means for connecting said tongue with the said lever-arms, substantially as set forth.

3. In a truck for a threshing and separating mechanism, the combination of the framework supporting said mechanisms, the front wheels, wheel-supporting devices adapted to hold the axes of said wheels against vertical vibration, but permitting horizontal vibration thereof, the thresher-frame sills A A extending continuously forward of the said front-wheel axes, the rear wheels, the support for the rear wheels adapted to permit their axes to vibrate vertically in relation to the thresher-frame, and means for holding them against vibration horizontally, substantially as set forth.

4. In a truck for a threshing and separating mechanism, the combination of the framework adapted to support the threshing and racks located at opposed stations, travelers having gear meshing

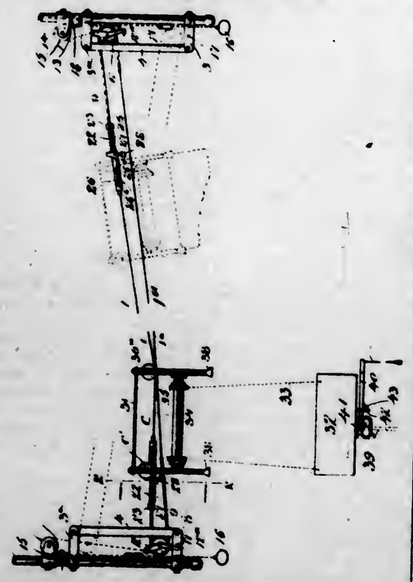
a spiral spring surrounding the tube and bearing

4. In a truck for a threshing and separating mechanism, the combination of the framework adapted to support the threshing and straw-separating devices and having the bottom elongated sill-bars A A, the axle-loops O extending from below said sill-bars to points above them, the extension sill-bars A^2 at the rear of and secured to said loops, the rear axle passing through the said loops, the ground-wheels on the said axle, means for preventing the endwise movement of the axle relatively to the frame, but permitting it to rock vertically, the front wheels situated behind the front ends of the sill-bars A A, and each adapted to be turned horizontally on an independent vertical axis, substantially as set forth.

5. In a vehicle-truck, the combination of the elongated sills A A, the front-wheel-supporting devices arranged between the ends of the said sills in a plane transverse to the said sills and adapted to hold the wheels against vertical vibration but permitting the horizontal vibration thereof, the front wheels mounted on said supporting devices, the rear wheels, the support for the rear wheels adapted to permit their axes to vibrate vertically in relation to the sills A A, and means for holding the said rear wheels against vibration horizontally.

6. In a vehicle-truck, the combination of the bottom elongated sills A A, the axle-loops O extending from below the said sills to points above them, the extension-sills A^2 at the rear of and secured to the said loops, the rear axle passing through said loops, the ground-wheels on the said axle, means for preventing the endwise movement of the axle relative to the frame, but permitting it to rock vertically, the front axle, and the front wheels mounted thereon.

810,092. STORE-SERVICE APPARATUS. GUSTAV STAIB, New York, N. Y. Filed Feb. 10, 1905. Serial No. 245,005.



Claim.—1. A store-service apparatus comprising upwardly-disposed guides located at opposed stations, travelers guided by said guides, an endless connection between said travelers, wheels comprised in and connecting said travelers with said endless connection, and means for causing said wheels to rotate during the operation of the travelers for operating said endless connection by the vertical movement of one traveler to cause the other traveler to descend, substantially as described.

2. A store-service apparatus comprising a plurality of racks located at opposed stations, travelers having gears meshing with said racks, a conveyer-track extending between said stations, and means for causing the rotation of said gears to impart longitudinal movement to the track to operate the corresponding traveler, substantially as described.

3. A store-service apparatus comprising upwardly-disposed racks located at opposed stations, travelers having gears meshing with said racks, sprockets connected with said gears, and an endless track between said stations provided with chains meshing with said sprockets, whereby as one traveler is raised it will operate the track and chains to cause the opposite traveler to descend, substantially as described.

4. A store-service apparatus comprising upwardly-disposed racks located at opposed stations, travelers having gears meshing with said racks, sprockets connected with said gears, chains passing over said sprockets, wires connecting the corresponding ends of opposed chains, and means for elevating the travelers, whereby as one traveler rises the chains and wires will operate the gear of the other traveler to cause the latter to descend, substantially as described.

5. A store-service apparatus comprising a pair of upwardly-disposed guides located at opposed stations, racks associated with said guides, travelers at each station having rollers and gears for coacting with the associate guides and racks, said travelers having sprocket-wheels, an endless connection between the travelers provided with chains passing over said sprockets, and means for elevating the travelers, whereby when one traveler is elevated the chains and connection will be moved to cause the other traveler to descend, substantially as described.

6. A store-service apparatus comprising upwardly-disposed guides located at opposed stations, travelers guided by said guides, a track between said travelers, flexible connections for operating each traveler, pulleys over which such connections pass, a weight connected with the free portion of each connection, and pulleys over which said weights pass, whereby the lower free ends of the flexible connections are kept raised, substantially as described.

7. A store-service apparatus comprising guides located at opposed stations, travelers guided by said guides, a track connected with said travelers, locks connected with the travelers for holding them in a lowered position, means for raising said travelers and for simultaneously releasing said locks, substantially as described.

8. A store-service apparatus comprising upwardly-disposed guides located at opposed stations, travelers guided by said guides, a track connected with said travelers, hooks movably connected with said travelers, projections to receive said hooks, flexible connections connected with said hooks, and pulleys for said flexible connections, whereby when said connections are pulled the travelers will be unlocked and elevated, substantially as described.

9. A store-service apparatus comprising racks located at opposed stations, travelers provided with gears meshing with said racks, yokes connected with said travelers and provided with hooks, projections to be engaged by said hooks, flexible connections connected with said yokes, and pulleys receiving said connections, said hooks being supported in position to engage the projections when the travelers are lowered, the flexible connections when pulled serving to release the hook from the projections and elevate the travelers, substantially as described.

10. A store-service apparatus comprising pairs of upwardly-disposed guides located at opposed stations, means for supporting said guides to have a space between them, racks associated with said guides, travelers provided with rollers engaging the guides and also having gears engaging the racks, yokes movably connected with the travelers, hooks connected with the yokes, projections to be engaged by the hooks, flexible connections extending from the yokes, and pulleys receiving said connections, substantially as described.

11. A store-service apparatus comprising pairs of upwardly-disposed guides located at opposed stations, means for supporting said guides to have a space between them, racks associated with said guides, travelers provided with rollers engaging the guides and also having gears engaging the racks, yokes movably connected with the travelers, hooks connected with the yokes, projections to be engaged by the hooks, flexible connections extending from the yokes, pulleys receiving said connections, a weight associated with each traveler, a flexible connection extending from each weight and connected with the flexible connection of the corresponding traveler, and pulleys receiving the connections of the weights, whereby said weights keep the free part of the first-named connections elevated when not in use, substantially as described.

12. In a store-service apparatus the combination of a track, with a brake-shoe movably carried thereby and having an abutment at one end, means to suspend the brake-shoe upon the track, a spiral spring surrounding the track, and an abutment on the track, the spring being located between the abutment and the brake-shoe, substantially as described.

13. In a store-service apparatus the combination of a track, with a tube thereon, an abutment on the track adjacent to the tube, a spiral spring surrounding the tube and bearing against the abutment, and a brake-shoe mounted upon the tube and having an abutment, said shoe bearing against said spring, substantially as described.

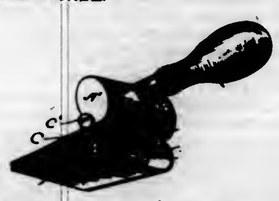
14. In a store-service apparatus the combination of a track, with a tube thereon, an abutment on the track adjacent to the tube, a spiral spring surrounding the tube and bearing against the abutment, a brake-shoe mounted on the tube and having an abutment, said shoe bearing against the spring, and means to support the brake-shoe slidably upon the tube, substantially as described.

15. In a store-service apparatus the combination of a track, with a shoe mounted thereon, and a resilient stop for the shoe, said shoe having ledges on opposite sides and an abutment at one end, said ledges being depressed adjacent to the abutment to receive the wheel of the carrier, substantially as described.

16. In a store-service apparatus the combination of a track, with a tube mounted thereon, a brake-shoe having a recess on its under surface mounted upon said tube, a spring to resist the thrust of the shoe, said shoe having an abutment adjacent to the spring, and ledges on the shoe on the side of the abutment opposite the spring, substantially as described.

17. In a store-service apparatus the combination of a track, with a tube mounted thereon, a brake-shoe having a recess on its under surface mounted upon said tube, a spring to resist the thrust of the shoe, said shoe having an abutment adjacent to the spring, ledges on the shoe on the side of the abutment opposite the spring, and arms depending from the shoe to maintain the shoe upon the tube, substantially as described.

810,093. ENVELOP-SEALER. LOLA O. STAMBART, Portland, Oreg., assignor of two-thirds to O. W. Mielke, Portland, Oreg. Filed July 18, 1905. Serial No. 270,242.



Claim.—1. The combination with a tank, of a moistening-pad connected to said tank, and spaced plates carried by said tank for sealing the article the under plate having a curved edge for the purpose described.

2. The combination with a tank of a frame detachably connected thereto, a pad carried by said frame, a roller carried by said frame under the pad, and plates extending from said tank adapted to engage the envelop and flap, for the purpose described.

3. The combination with a tank provided with a spaced metal plate extending therefrom, of a frame detachably secured to said tank to the rear of the plates, and a moistener carried by the frame, a roller journaled in said frame supporting the tank and plate for the purpose described.

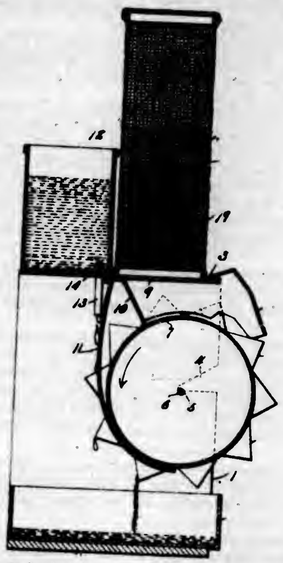
4. The combination with a tank provided with spaced metal plate extending therefrom, an opening formed in said tank, a handle secured in said opening and a moistener carried by the tank, for the purpose described.

5. The combination with a tank provided with spaced metal plate extending therefrom, an opening formed in the under side of the tank a frame detachably secured to said tank, a pad carried by said frame, and extending up in the opening in the tank, a roller mounted on the frame and supporting the tank, and a removable handle connected to said tank, for the purpose described.

6. The combination with a tank provided with a screw-threaded neck, and having spaced plates extending therefrom, the under plate being cut away, an opening formed in the bottom of said tank, to one side, of a wire frame secured to one side of the tank, and projecting under the tank, a metal strip secured to said frame having downwardly-projecting ears, a pad secured on said strip, a roller journaled in said ears, and a handle secured in said screw-threaded neck of the tank, for the purpose described.

810,094. MECHANICAL FLY-TRAP. THOMAS W. THRESHER, Cheyenne, Okla. Filed Sept. 20, 1905. Serial No. 279,228.

Claim.—1. In a mechanical fly-trap, a casing having an aperture in the top thereof, a cylinder supported for rotation therein, a trap supported directly above the aperture in the top of the casing above said cylinder, a scraper directed from the rear edge of the aperture radially toward the cylinder, and a hood extending from the upper front edge of the casing over and beyond the front side of the cylinder.



2. In a mechanical fly-trap, a casing having an aperture in the upper side thereof, a slowly-driven cylinder supported for rotation in said casing, a trap supported above the aperture, and a hood extending from the upper front edge of the casing forwardly over and beyond the front side of the cylinder.

3. In a mechanical fly-trap, a rectangular frame having an aperture in its upper side, a slowly-driven cylinder supported for rotation in the casing, a trap supported above the aperture, a hood extending from the upper front edge of the casing forwardly over and beyond the front side of the cylinder, a scraper directed from the rear edge of the aperture toward the cylinder, and a shield depending in rear of the scraper behind and beneath the cylinder.

4. In a mechanical fly-trap, a casing having an aperture in the top thereof, a cylinder supported for rotation therein, a trap supported directly above the aperture in the top of the casing above said cylinder, a scraper directed from the rear edge of the aperture radially toward the cylinder, a curved shield disposed in rear of the scraper and adjacent to the cylinder, and a hood extending from the upper front edge of the casing over the cylinder.

810,095. STOCKING AND PROCESS OF MANUFACTURING SAME. MAX THUN, Reading, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a Corporation of Pennsylvania. Filed June 23, 1904. Serial No. 213,662.

Claim.—1. A stocking knitted throughout of the same yarn and having a foot portion thereof subsequently shrunken to vary the texture of such portion.

2. A varicolored stocking knitted throughout of the same yarn and having its upper portion dyed and its lower portion undyed and shrunken.

3. A varicolored stocking knitted throughout of the same yarn and thereafter dyed in the whole, the dyestuff being subsequently removed from the lower portion of its foot.

4. A varicolored stocking knitted throughout of the same yarn and thereafter dyed in the whole, the dyestuff being subsequently removed from the lower portion of its foot and such portion being shrunken to vary its texture.

5. A varicolored stocking knitted throughout of the same yarn and thereafter dyed in the whole, the dyestuff being subsequently removed from the lower portion of its foot and the original and dyed colors being intermixed to form a figured meeting line between them.

6. A varicolored stocking knitted throughout of the same yarn and thereafter dyed in the whole, the dyestuff being subsequently removed from the lower portion of its foot and the original and dyed colors being intermixed to form an interlocking stitch effect at the meeting line.

7. A varicolored stocking knitted throughout of the same yarn and thereafter dyed in the whole, the dyestuff being subsequently removed to provide an undyed foot portion and a figured upper portion.

8. The improved process of manufacturing stockings which consists in knitting the fabric throughout of the same yarn and subsequently shrinking a foot portion only, to vary its texture.

9. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the upper portion, and shrinking the undyed foot portion.

10. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the whole fabric, and subsequently removing the dyestuff from the foot portion.

11. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the whole fabric, and subsequently removing the dyestuff from the foot portion and shrinking such portion.

12. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the whole fabric, and subsequently removing the dyestuff solidly from the lower foot portion thereof and brokenly at the meeting line of said lower foot portion to produce an ornamental effect at said meeting line.

13. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the whole fabric, and subsequently removing the dyestuff solidly from the lower foot portion thereof and brokenly at the meeting line of said lower foot portion to produce an interlocking stitch effect.

14. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, dyeing the whole fabric, and subsequently removing the dyestuff to produce an undyed foot portion and a figured upper portion.

15. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, impregnating the whole fabric with dyestuff, mounting the fabric upon an interior support and applying a dye-neutralizing agent to the foot portion of the stocking.

16. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, impregnating the whole fabric with oxidizing dyestuff, mounting the fabric upon an interior support, applying a dye-neutralizing agent to the foot portion of the stocking, and thereafter oxidizing the unneutralized dyestuff.

17. The improved process of manufacturing varicolored stockings which consists in knitting the fabric throughout of the same yarn, impregnating the whole fabric with oxidizing dyestuff, mounting the fabric upon an interior support, applying an alkaline dye-neutralizing agent to the foot portion of the stocking, and thereafter oxidizing the unneutralized dyestuff.

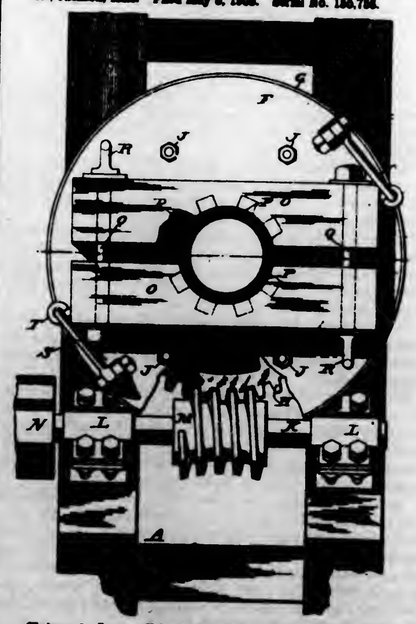
810,096. PIPE-WRENCH. JOHN H. VINSON, Boston, Mass., assignor to Louis C. Smith, Winthrop, Mass. Filed Jan. 24, 1905. Serial No. 242,468.

Claim.—1. In a wrench of the character described, a bar or shank provided with rack-teeth on its under side and a stationary jaw integral therewith; a movable jaw comprising the yoke or covering *h* and the solid working portion *e* substantially filling said yoke or covering; and a solid nut provided with a worm engaging the rack-teeth and having trunnions integral with the nut held in place in the portion *c* by said covering *h*, substantially as set forth.

2. In a wrench of the character described, a bar or shank provided with teeth on its under side, and a stationary jaw integral therewith; a movable jaw comprising the main or working portion *e*, and the yoke or covering *h* rigidly secured to the main portion and loosely embracing the said shank whereby the movable jaw can swing with relation to the shank; and a solid nut provided with a worm engaging the teeth and supported by said yoke or covering, substantially as set forth.

3. In a wrench of the character described, a bar or shank provided with rack-teeth on its under side and a stationary jaw integral therewith; a movable jaw comprising the yoke or covering *h* provided with the opposite openings *w* and with integral extensions *y* projecting into said openings, and a solid inserted working portion *e* provided with a recess substantially registering with and between said openings; and a nut provided with a suitable worm and having an annular groove *v* in its cylindrical portion into which the said parts *y* extend, said extensions *y* bearing against the opposite sides of the nut within the groove *v*, and said nut being supported by the inserted portion *e* and with its worm extending through the opposite openings in the covering portion *h*, for the purpose set forth.

810,097. WELL-BORING APPARATUS. ANDREW K. WALLIS, Sr., Jackson, Miss. Filed May 5, 1903. Serial No. 155,756.



Claim.—1. In a well-boring machine, the combination of a rotatable table; a clamp comprising two blocks or timbers O, O, each having a semicircular recess formed in the face adjacent to the corresponding member; yielding plugs mounted in the blocks in line with said recesses; bolts Q extending through said blocks, one end of each bolt being provided with an enlarged eye R; and means for securing said members O to the table.

2. In a well-boring machine, the combination of a rotatable table; a clamp comprising two blocks or timbers O, O, each having a semicircular recess formed in the face adjacent to the corresponding member; yielding plugs mounted in the blocks in line with said recesses; bolts Q extending through said blocks, one end of each bolt being provided with an enlarged eye R; hooks pivotally secured to the table; and means for securing connection between said hooks and the blocks or timbers.

810,098. CORN-HUSKER. THEOPHIL P. WALTER, Beatrice, Nebr., assignor to The Beatrice Manufacturing Company, Beatrice, Nebr., a Corporation of Nebraska. Filed Mar. 26, 1905. Serial No. 252,481.

Claim.—1. In a corn-husker, the combination with a base member having a pivot-receiving opening, a plurality of sockets disposed radially with respect to said opening, and a slot arranged concentric to said opening, of a husk-engaging member comprising a body having at one end a pivot that engages in the pivot-receiving opening and at its other end an outstanding husk-engaging hook, said body, furthermore, being provided with an inset tooth that engages in the sockets, and holding means passing through the slot of the base member and engaging the body of the husk-engaging member.

2. In a corn-husker, the combination with a base member having an opening, of a husk-engaging member having an offset longitudinally-extending element at one end that engages in the opening and interlocks with the base member and an outstanding hook at its other end, and a device detachably engaging the husk-engaging member between its ends and between the hook and interlocked element, said device engaging the base member and holding the husk-engaging member against movement thereon.

3. In a corn-husker, the combination with a base member, of a husk-engaging member having a substantially flat body portion that rests against the base member and is provided with an outstanding curved hook at one end, the curved portion of said hook having a longitudinally-disposed strengthening-rib that terminates at the body portion to permit the same to lie upon the base member, and means for securing the husk-engaging member to the base member.

4. In a corn-husker, the combination with a base member having an opening, of a husk-engaging member having a substantially flat body portion that rests against the base member and is provided at one end with a longitudinally-extending element that engages in the opening and interlocks with the base member, said body portion being provided at its opposite end with an outstanding curved hook overhanging the body portion and terminating short of the longitudinally-extending element, said hook having a longitudinally-disposed strengthening-rib that terminates at the body portion to permit of the same lying upon the base member, and a device engaging the body portion and the base member to hold the former against movement on the latter.

5. In a corn-husker, the combination with a base member having a pivot-receiving opening, a plurality of sockets disposed radially with respect to said opening and a slot arranged concentric to said opening, of a husk-engaging member comprising a body having at one end a pivot that engages in the pivot-receiving opening and at its other end an outstanding husk-engaging hook, said body being furthermore provided with an inset tooth that engages in the sockets, and a holding-screw passing through the slot of the base member and engaging the body of the husk-engaging member.

6. In a corn-husker, the combination with a base member, of a husk-engaging member, one of said members having a plurality of sockets, the other having a tooth that engages in the sockets, a pivotal connection between the members, and means separate from the pivotal connection and connecting the members at one side thereof for holding the tooth in different sockets and the husk-engaging member against pivotal movement on the base member.

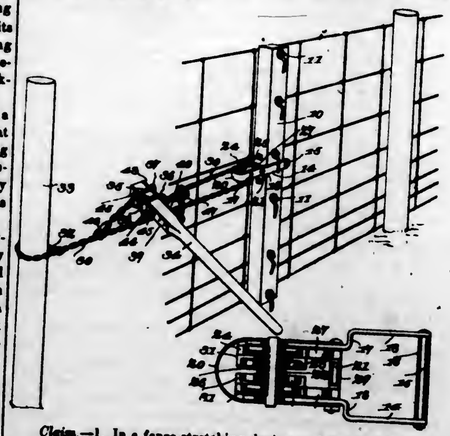
7. In a corn-husker, the combination with a base member having an opening and a socket, of a husk-engaging member comprising a body-plate having an offset integral lug at one end that engages in the opening, an outstanding integral hook at the other end, and an intermediate integral tooth that fits in the socket, and means independent of the lug and connecting the plate and base member at one side of said lug to hold the same against relative movement.

8. In a corn-husker, the combination with a base member, of a husk-engaging member mounted thereon and comprising a sheet-metal body-plate having an outstanding curved and overhanging hook, the curved portion of said hook being provided with a longitudinally-disposed stamped strengthening or stiffening rib that terminates short of the body-plate and the end of the hook.

9. In a corn-husker, the combination with a base member having an opening, of a husk-engaging member comprising a body portion that rests against the base member, said husk-engaging member having a longitudinally-disposed offset retaining-lug that projects beyond one end of the body portion and is movable through the opening into and out of engagement with the opposite side of the base member to that against which the body portion rests, and having at its other end an outstanding hook that extends toward the end having the lug, and a holding device connecting the base member and the body portion between the retaining-lug and the hook.

10. In a corn-husker, the combination with a wrist-strap having an extension-flap at one of its side margins, of a base secured to one end of the strap and extending over the flap, a palm-strap secured to the other end of the base, said base having an opening, a husk-engaging member comprising a body portion having an offset terminal retaining-lug that projects beyond the body portion and engages in the opening of the base, an outstanding hook located at the other end of the body portion and having a longitudinally-disposed stiffening-rib between its side edges, and a holding device connecting the body portion and the base.

810,099. WIRE-FENCE STRETCHER. ISAAC M. WARNER, Harvard, Ill., assignor to Frank C. Boss, Union City, Mich. Filed Oct. 5, 1905. Serial No. 281,440.



Claim.—1. In a fence-stretching device, a clamp member having means for attachment to the fence material to be stretched, spaced bars disposed opposite sides of said clamp member and extended inwardly and contracted intermediate their ends for bearing upon one face of said clamp member, a bolt coupling said spaced bars and bearing upon the opposite face of said clamp member, a clamp-bolt coupling the contracted portions of said spaced bars, a shaft journaled through the contracted portions of said spaced bars and extended beyond the same, a grip member having spaced peripheral recesses for receiving the links of a chain and carried by said shaft ratchets rotative with said grip member, pawls carried by said clamp-bolt and engaging said ratchets, a U-shaped guard, embracing said side members at their contracted ends and provided with apertures for receiving the extended ends of said shaft and through which the pawl-carrying clamp-bolt passes, means for connecting one end of said chain to a stationary structure and means for applying a strain to said chain to cause rotation of said chain-grip and ratchets.

2. In a fence-stretching device, a clamp member having means for connecting to the fence material to be stretched, a frame mov-

ably disposed upon said clamp member, a grip member having opposed peripheral recesses for receiving the links of a chain and rotatively mounted in said frame, ratchets rotative with said grip member, pawls carried by said frame and engaging said ratchets, a chain having means at one end for detachably coupling to a stationary structure and bearing around said grip member, a lever having reversely-disposed clips movably arranged thereon, a grab-hook attached to one of said clips for engaging said chain between the lever and the stationary structure, and a grab-hook connected to the other clip for engaging the chain between the lever and chain-grip member.

810,100. DISPENSING-CABINET. SETH WHEELER, Albany, N. Y. Filed Dec. 28, 1904. Serial No. 287,667.

Claim.—1. As a new article of manufacture, a dispensing-cabinet for toilet-paper having an opening in its bottom in close proximity to the back of the cabinet, the bottom of the cabinet arranged to support sheets of paper with the free edges thereof overhanging said opening and free to enter the same successively.

2. As a new article of manufacture, a dispensing-cabinet comprising a back adapted to be secured to a suitable support, a box having a hinged connection at its lower end with said back, said box having a bottom for supporting sheets of paper and having an opening at the hinged edge of the box, and means for locking the box to the back.

3. As a new article of manufacture, a dispensing-cabinet comprising a back having side flanges, a box or receptacle hinged at its lower end to the flanges of the back, a bottom in said box for supporting sheets of paper, the rear edge of said bottom spaced from the back to form a discharge-outlet for sheets of paper.

4. As a new article of manufacture, a dispensing-cabinet comprising a back adapted to be secured to a wall or other support, a receptacle having a bottom pivotally connected with the back and spaced at its rear edge therefrom to form a narrow delivery-opening when the cabinet is closed, substantially as and for the purpose set forth.

5. As a new article of manufacture, a dispensing-cabinet comprising a back adapted to be secured to a wall or other support, a box hinged at its lower end thereto, and the bottom of said box at its hinged edge bent back forming a discharge-opening through which the contents of the cabinet are to be withdrawn.

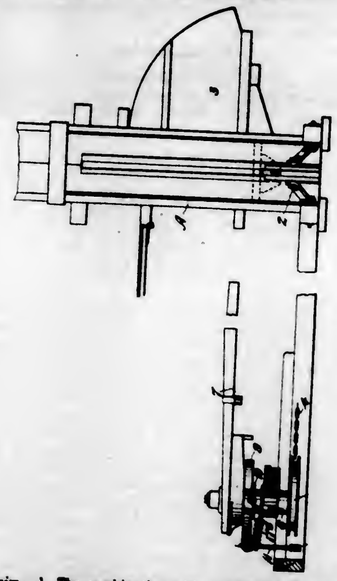
6. The combination with a cabinet for toilet-paper, a pin or short shaft extending through the front of said cabinet, a pointer secured on the outer end of the pin or shaft, an arm secured on the inner end of the shaft or pin, a lateral extension on said arm to rest on the package of paper in the cabinet, and move downwardly as the height of the package becomes reduced.

7. The combination with a cabinet for toilet-paper having a depressed or indented portion in its front or an equivalent curb surrounding the pointer, a pointer movable in said depressed portion or curb, an arm on the inside of the cabinet connected with the pointer, and a pin or extension of the arm supported on the top of the paper and adapted to move downward as the paper is removed through the bottom of the cabinet and turn the pointer to indicate the quantity of paper in the cabinet.

810,101. KNEADING-TRAY. WILLIAM C. BLACK, Plymouth, Ohio. Filed Oct. 31, 1904. Serial No. 230,510.

Claim.—A kneading-tray constructed of sheet metal and composed of a bottom, and rigid front, rear and side walls, the side walls having front tapering terminal portions forming openings and stiffening the bottom thereat, and the said front wall consisting of a roll extending above the bottom and also projecting below the same to form a depending stop for engaging the edge of a table.

810,102. BALING-PRESS BRAKE. WILLIAM S. BRADSHAW, San Jose, Cal. Filed Dec. 6, 1904. Serial No. 235,675.



Claim.—1. The combination with a vertical baling-press, the follower-actuating mechanism thereof and a power-sweep, of a vertical column to which the sweep is fixed and through which the follower-actuating mechanism is operated, a member movable in unison with the column, a brake-shoe, and means for holding said shoe yieldingly in contact with said member for retarding the downward movement of the follower after the release of the sweep.

2. A baling-press having a vertically-movable follower, a vertical column, connections between the column and the follower for raising the latter to compress charges within the press-box, means whereby the column may be rotated, a friction member carried by the column, and a brake-shoe and means whereby it is held in contact with said friction member by an elastic pressure whereby the downward movement of the follower is retarded.

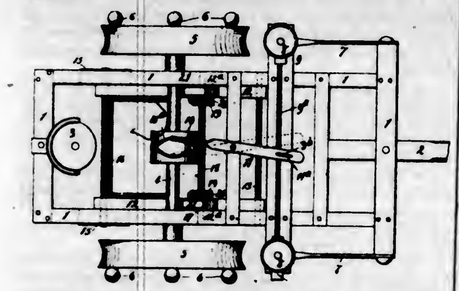
3. In a baling-press, a power mechanism, including a vertical column with a chain-pulley, and a sweep, an eccentric rim fixed to and revoluble with the column, a brake-shoe, a yielding support upon which the shoe is carried, and means by which the brake-shoe is held in contact with the rim by an elastic pressure.

4. A brake mechanism for baling-presses, comprising a follower, a power-sweep, intermediate mechanism through which power is transmitted to raise the follower, and a brake whereby the return movement of the follower is controlled, said brake consisting of an eccentrically-mounted rim, a shoe contacting with said rim, and means for applying pressure to said shoe.

5. A brake mechanism for baling-presses, comprising a follower, a power-sweep, intermediate mechanism through which power is transmitted to raise the follower, and a brake whereby the return movement of the follower is controlled, said brake consisting of a shoe, a swiveled yoke upon which the shoe is mounted, a rim eccentrically mounted upon the sweep-column, and means for applying pressure to force the shoe against the rim.

810,103. CORN-PLANTER. ANDREW J. BROWN, Chicago, Ill. Filed May 25, 1903. Serial No. 159,176.

Claim.—1. In a corn-planter, drive-wheels mounted on a rotatable axle; a main frame mounted on said axle; an auxiliary frame having one end hinged to the main frame, and provided at its opposite end with auxiliary wheels, and having side plates each provided with a concave seat formed in its upper edge; a rocking shaft connected with the main frame; means for partially rotating said shaft; cams secured on said shaft, and adapted to engage the said concave seats in the auxiliary frame; seed-hoppers supported by the main frame; feed-plates arranged in said hoppers; a cam-wheel secured on said axle, and encircled by an endless serpentine groove formed in its circumference, said groove crossing itself three times at equal intervals; a lever fulcrumed on the main frame, and having one of its ends connected with the said feed-plates, and provided at its opposite end with means adapted to travel in the groove in the cam-wheel.

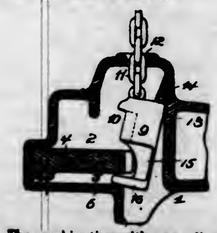


2. In a corn-planter, a main frame mounted on a main axle; an auxiliary frame having one end connected with the main frame, and provided at its opposite end with auxiliary wheels; a U-shaped foot-lever having its opposite sides fulcrumed on the auxiliary frame, and provided at each of its ends with a roller adapted to engage the under side of the main frame; and a cam-wheel mounted on the main axle, and encircled by a serpentine groove crossing itself three times, for the purpose described.

3. In combination with a planter or the like having drive-wheels and a main frame; an auxiliary frame having its front end hinged to the main frame, and provided at its rear end with auxiliary wheels, said auxiliary frame having side plates provided with concave seats formed in their upper edge; a rocking shaft supported by the main frame and provided with a lever for partially rotating same; and cams secured on said rocking shaft and adapted to engage the said concave seats in the auxiliary frame for the purpose described.

4. In combination with a planter or the like having drive-wheels and a main frame; an auxiliary frame having one end hinged to the main frame, and provided at its opposite end with auxiliary wheels; a U-shaped foot-lever having its opposite sides fulcrumed on the auxiliary frame, and provided at each of its ends with a roller adapted to engage the under side of the main frame for the purpose described.

810,104. CAR-COUPLING. SAMUEL P. BUSH, Columbus, Ohio. Filed May 13, 1905. Serial No. 260,263.



Claim.—1. The combination with a coupling-head and a knuckle pivotally supported therein, the tail of the knuckle having a depending shoulder, of a locking-block having a toe, adapted when the block is in a set position to rest on the floor of the coupling-head and in the path of the depending shoulder on the tail of the knuckle.

2. The combination with a coupling-head and a knuckle pivotally supported therein, the tail of the knuckle having a depending projection located near its inner or rear end, of a locking-block having a toe depending from its under side, the said toe adapted, when the block is in its set position, to rest on the floor of the coupling in the path of the projection on the tail of the knuckle and means for tilting the locking-block.

3. The combination with a coupling-head and a knuckle pivotally supported therein and provided with a depending shoulder near the rear end of its tail, of a locking-block having a toe adapted when the block is in a set position, to rest on the floor of the head in the path of the shoulder, and a shoulder in the path of vertical movement of the locking-block for tilting the block laterally, substantially as set forth.

4. The combination with a coupling-head having an opening in its bottom and a depending flange located to one side of said opening, and a knuckle pivoted in said head, the tail of said knuckle being provided with a depending shoulder near its rear end, of a vertically-movable and laterally-swinging locking-block having a toe depending therefrom, the said toe adapted, when the locking-block is in set position to rest on the floor of the coupling-head in the path of the shoulder on the tail of the knuckle, and means for tilting said locking-block.

5. A knuckle for car-coupling provided with a rearwardly-depending tail, the latter having a projecting shoulder located at the rear end of the tail for engaging and dislodging the locking-block.

810,105. CLEANING COMPOUND. JOHN CALLAHAN, Seattle, Washington. Filed May 3, 1905. Serial No. 258,722.

Claim.—1. A cleaning compound having incorporated therein silicate of soda, cutch and glucose.

2. A cleaning compound having incorporated therein a silicate, and an astringent extract and glucose.

3. A cleaning compound having incorporated therein an alkaline silicate, and an astringent.

4. A cleaning compound having incorporated therein a silicate and an astringent extract.

5. A cleaning compound composed of seventy-nine per cent. alkali, ten per cent. cutch, ten per cent. glucose, and one per cent. carmin.

810,106. JAR-CLOSURE FASTENER. FRANK CANFIELD, Denver, Colo., assignor to George W. Skinner, Jr., Denver, Colo. Filed Aug. 3, 1904. Serial No. 219,278.

Claim.—The combination with a jar or receptacle having a cap or closure which is highest in the center and provided with a shallow exterior concavity formed in its highest part, of a bail pivotally mounted on the body of the receptacle and extending upwardly over the cap, and a cam-lever having two sides connected at the top and whose lower edges are separated, the said lever having transverse openings in its sides through which the bail passes, whereby the lever is fulcrumed on the bail, the lever occupying a position crosswise of the bail, with its lower edges engaging the concavity when in the locked position.

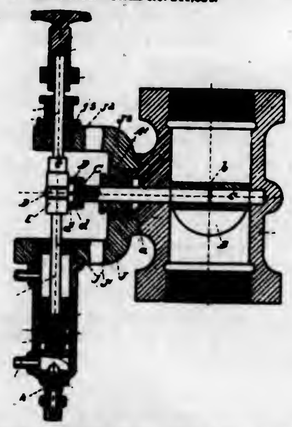
810,107. DISTRIBUTER FOR FINELY-DIVIDED SUBSTANCES. ABRAHAM CORNBROOK, New York, N. Y. Filed Sept. 13, 1905. Serial No. 278,222.

Claim.—1. A cover for a receptacle for finely-divided substances, said cover provided with holes or perforations, a rod passing

through an opening in said cover and adapted to slide in said opening, a lateral extension to the inside of said rod, and pins projecting from said extension in substantially the same direction as said rod, and a spline on the rod engaging with a recess in the cover for keeping the pins in register with the perforations.

2. A cover for a receptacle for finely-divided substances, said cover provided with holes or perforations, a rod passing through an opening in said cover and adapted to slide in said opening, a lateral extension to the inside of said rod, and pins projecting from said extension in substantially the same direction as said rod, and a lateral extension or stop on the outside of said rod, and a tension-spring held between the cover and the inner lateral extension of the rod for keeping said pins away from said perforations unless positively drawn to or through the same against the action of the spring.

810,108. **PRESSURE-GOVERNOR.** RUDOLPH CONRADER, Erie, Pa. Filed June 3, 1904. Serial No. 211,054.



Claim.—1. In a pressure-governor, the combination of a valve-chamber; a butterfly-valve in said chamber; a stem extending from said valve to without the chamber; a pressure device and means for communicating the action of the pressure device to the valve-stem to oscillate the stem, said pressure device and means being arranged to close the valve with an increase of fluid-pressure upon the pressure device, and to open the valve with a decrease in pressure; and an adjustable stop for limiting the opening movement of the valve.

2. In a pressure-governor, the combination of a valve-chamber; a butterfly-valve in said chamber; a stem extending from said valve to without the chamber; a pressure device and means for communicating the action of the pressure device to the valve-stem to oscillate the stem, said pressure device and means being arranged to close the valve with an increase of fluid-pressure upon the pressure device, and to open the valve with a decrease in pressure; and adjustable stops for limiting the closing and opening movements of the valve.

3. In a pressure-governor, the combination of a valve-chamber; a valve in said chamber; a pressure device for controlling said valve, said pressure device comprising the cylinder H, a piston therein; and means connecting the valve; and adjustable stop *h* screwed into the end of the cylinder and adapted to contact the piston.

4. In a pressure-governor, the combination with the valve-chamber; a valve in said chamber; a pressure device for actuating said valve; a frame for supporting said pressure device, said pressure device comprising a cylinder; a piston therein; a stem connecting said piston with the valve-actuating mechanism; a counter-pressure mechanism operating upon said stem; and the adjusting-screw *h*' forming a guide and adjustable stop for the stem for limiting the closing movement of the valve.

5. In a pressure-governor the combination with the valve-chamber; an oscillatory valve therein; a stem extending from said valve to without the chamber; a crank on said stem; and a frame for carrying the pressure device comprising two arms extending each side of the crank; a pressure-cylinder on one of said arms; a yoke engaging said crank; and a stem extending from the pressure-cylinder to the yoke and from the yoke past the second arm on the frame; a spring-yoke on the stem; and springs connecting the spring-yoke to the opposite arm of the frame.

6. In a pressure-governor, the combination of the valve-chamber; an oscillatory valve therein; a stem extending from said valve to without the chamber; a frame J having the arms J' and J² thereon; a crank D on the stem; the yoke E engaging said crank; the stem F extending through the arm J' and the extension F' extending through the arm J²; a pressure device arranged on the arm J and adapted to operate on the stem F; a spring-pressure device adapted to operate upon the extension F' against the pressure device, said stem F being arranged in line with the crank-pin of the crank; and the adjustable stops *h* and *h*' for limiting the opening and closing movements of the valve.

7. In a governor, the combination with the valve-chamber; a butterfly-valve therein; a stem controlling said butterfly-valve; and valve-actuating means adapted to engage the stem for actuating the valve, said means being rotatively mounted relatively to the valve-chamber.

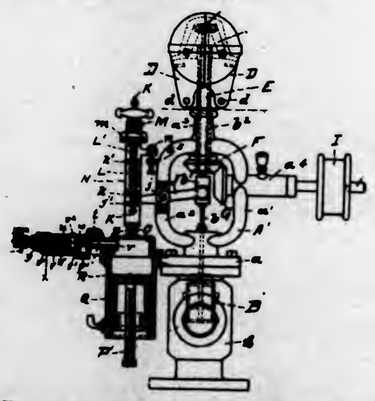
8. In a governor, the combination with the valve-chamber; a butterfly-valve therein; a stem controlling said butterfly-valve; and valve-actuating means adapted to engage the stem for actuating the valve, said means being rotatively mounted relatively to the valve-chamber and concentric to the valve-stem.

9. In a governor, the combination of the valve-chamber; a butterfly-valve therein; a stem controlling said valve; a valve-actuating means adapted to engage said stem and to actuate the valve, said means being rotatively mounted on the valve-chamber; and means for locking the means in adjustment.

10. In a pressure-governor, the combination of a valve-chamber; a butterfly-valve in said chamber; a stem for actuating said valve; a pressure device for actuating said valve through said stem; a frame carrying said pressure device, said frame being rotatively mounted relatively to said valve-chamber.

11. In a pressure-governor, the combination of the valve-chamber, a butterfly-valve therein; a stem extending from said valve to without the chamber; a crank on said stem; means for actuating said crank to actuate the valve; a frame supporting said means, said frame being rotatively mounted relative to said chamber; and means for adjusting the crank on the stem with a change in relation between the frame and the valve-chamber.

810,109. **VACUUM-GOVERNOR.** RUDOLPH CONRADER, Erie, Pa. Filed Jan. 23, 1905. Serial No. 242,280.



Claim.—1. In a vacuum-governor the combination of the centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; and means controlled by the fluid to be pumped for acting upon one of said elements to vary the action of the governor.

2. In a vacuum-governor, the combination of the centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; and means controlled by the fluid to be pumped for acting upon the centripetal element to vary the action of the governor.

3. In a vacuum-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; means actuated by the fluid to be pumped for varying the relative strength of one of the elements within the limits of power exerted by the other element.

4. In a vacuum-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; means actuated by the fluid to be pumped for varying the strength of the centripetal element within the limits of power exerted by the other element.

5. In a vacuum-governor, the combination of a centrifugal element; a spring-actuated centripetal element arranged to act in opposition to said centrifugal element; means actuated by the fluid to be pumped for varying the strength of the spring compriesd in said centripetal element.

6. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element comprising a plurality of springs, said centripetal element being arranged to act in opposition to said centrifugal element; and means actuated by the fluid to be pumped for throwing said springs into and out of action to vary the strength of the centripetal element.

7. In a vacuum pump-governor, the combination of a centrifugal element arranged to tend to move outwardly at the slowest speed at which the governor is designed to operate; a centripetal element arranged to act in opposition to said centrifugal element; means actuated by the fluid to be pumped for automatically varying the strength of one of said elements within the limits of power exerted by the other element.

8. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; a pressure device having one side exposed to a constant pressure of the atmosphere and the opposite side to a pressure controlled by the fluid to be pumped; a counter-pressure device actuated by the fluid to be pumped and against the constant pressure; and means communicating the action of the pressure device to one of said elements of the governor.

9. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; a pressure device having one side exposed to a constant pressure of the atmosphere and the opposite side to a pressure controlled by the fluid to be pumped; a counter-pressure device actuated by the fluid to be pumped and against the constant pressure; and means communicating the action of the pressure device to the centripetal element of the governor.

10. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; a pressure device having one side exposed to a constant pressure of the atmosphere and the opposite side to a pressure controlled by the fluid to be pumped; a counter-pressure device actuated by the fluid to be pumped and against the constant pressure; and means communicating the action of the pressure device to the centripetal element of the governor, to increase the strength of the centripetal element relatively to the centrifugal element when the pressure of fluid to be pumped increases and decreases the strength of the centripetal element relative to the centrifugal element when said pressure decreases.

11. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; a pressure device having one side exposed to a constant pressure of the atmosphere and the opposite side to a pressure controlled by the fluid to be pumped; a counter-pressure device actuated by the fluid to be pumped and against the constant pressure; and means communicating the action of the pressure device to one of said elements of the governor to vary the relative strength of one of said elements within the limits of power exerted by the other element.

12. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to operate in opposition to said centrifugal element; a pressure device having one side exposed to a constant pressure of the atmosphere and the opposite side to a pressure controlled by the fluid to be pumped; a counter-pressure device actuated by the fluid to be pumped and against the constant pressure; and means communicating the action of the pressure device to the centripetal element of the governor to vary the relative strength of said centripetal element relatively to the centrifugal element within the limits of power exerted by the centripetal element.

13. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element comprising a spring arranged to operate in opposition to the centrifugal element; a yoke against which said centripetal element is tensioned; a motor comprising the cylinder R, the pressure in which is below atmospheric pressure and controlled by the fluid to be pumped; the piston Q arranged in the cylinder and exposed to the atmosphere on one side and pressure on the cylinder at the opposite side; means for communicating the action of the piston to the yoke; and the counter-springs S operating against the pressure of the atmosphere on said piston.

14. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means connecting said motor with a fluid-supply, said motor being arranged to act with a change of pressure in the rarefied fluid to be controlled; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in the controlled fluid.

15. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a fluid supply which is below atmospheric pressure, said motor being arranged to act with a change of pressure in the rarefied pressure to be controlled; and means for intensifying the change of pressure in the motor over a change of pressure in the controlled fluid.

16. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a rarefied fluid, the pressure of which is to be controlled, said motor being arranged to act with a change of pressure in said fluid; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in the controlled fluid.

17. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means connecting said motor with a fluid-supply, said motor being arranged to act with a change of pressure in the rarefied fluid to be controlled; means for intensifying the change of fluid-pressure on the motor over a change of pressure in the controlled fluid; and means for controlling said intensifying action to vary the pressure on the motor in a fixed ratio to a change of pressure in the controlled fluid.

18. In a vacuum-governor, the combination of a motor arranged to actuate said governor, having one side exposed to a constant pressure as the atmosphere and the opposite side to fluid-pressure less than that of the atmosphere; a counter-pressure device acting against the constant pressure; means for varying said fluid-pressure as the pressure of the rarefied fluid to be controlled varies; and means for intensifying the change of said fluid-pressure over a change of pressure in the fluid to be controlled.

19. In a vacuum-governor, the combination of a motor arranged to actuate said governor, having an intake and an exhaust opening; means influenced by the fluid to be controlled for varying the capacity of one of said openings for varying the pressure on the motor.

20. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the fluid-supply of which is to be regulated, said motor having an intake-opening and an exhaust-opening into said connection, said motor being arranged to act as fluid is exhausted through said exhaust-opening and connection.

21. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake-opening and an exhaust-opening into said means of connection, and being arranged to act as the fluid is drawn through the exhaust-opening and connection; and means for varying the relative capacities of said intake and exhaust opening.

22. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake-opening and an exhaust-opening into said means of connection, and being arranged to act as the fluid is drawn through the exhaust-opening and connection; and means for varying the capacity of said exhaust-opening.

23. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake-opening and an exhaust-opening into said means of connection, and being arranged to act as the fluid is drawn through the exhaust-opening and connection; and means for automatically varying the relative capacities of the intake and exhaust opening.

24. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake-opening and an exhaust-opening into said means of connection, and being arranged to act as the fluid is drawn through the exhaust-opening and connection; and means influenced by the rarefied fluid to be controlled for automatically varying the relative capacities of said openings.

25. In a vacuum-governor, the combination of a motor for actuating said governor; means for connecting said motor with a vacuum-chamber, the fluid-supply of which is to be controlled, said

motor having an exhaust-opening into said means and an intake-opening; means for automatically varying the relative capacities of said openings with a variation of pressure in said connecting means; mechanism for controlling the extent of variation with a given variation of pressure in said connecting means; means for adjusting said mechanism to change the extent of variation in the relative capacities of the openings with a given variation of pressure in said connecting means.

26. In a vacuum-governor, the combination of a motor arranged to actuate said governor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake and exhaust opening leading to said connection; means for automatically varying the capacity of one of said openings with a variation of the rarefied fluid to be controlled; and means for controlling the extent of variation with a given variation of pressure in the controlled fluid.

27. In a vacuum-governor, the combination of a regulating-valve; a motor arranged to influence the regulating-valve; a counter-pressure mechanism varying in strength with the movement of the motor; means for connecting said motor with a vacuum-chamber, the pressure of which is to be controlled, said motor having an intake-opening and an exhaust-opening, the exhaust-opening leading to said connection; and means for automatically varying the relative capacities of said openings.

28. In a vacuum-governor, the combination of a regulating-valve; a motor arranged to influence the regulating-valve; a controlling-motor; means for connecting said controlling-motor with a vacuum-chamber, the pressure of which is to be controlled; means for applying the fluid-pressure on said regulating-motor to actuate it; and means controlled by said controlling-motor for intensifying the pressure on the regulating-motor over a change of pressure in said connecting means.

29. In a vacuum-governor, the combination of a regulating-valve; a regulating-motor arranged to influence said regulating-valve, said motor being provided with an intake-opening and an exhaust-opening; a controlling-motor; means for connecting said controlling-motor with a vacuum-chamber, the pressure of which is to be regulated; and a valve actuated by the controlling-motor and arranged to vary the relative capacities of said intake and exhaust openings.

30. In a vacuum-governor, the combination of a regulating-valve; a regulating-motor arranged to influence said regulating-valve, said motor being provided with an intake-opening and exhaust-opening; a controlling-motor, one side of which is exposed to the atmosphere and the other to the pressure of the fluid to be controlled; a counter-pressure device in said controlling-motor opposing the atmospheric pressure and assisting the fluid-pressure arranged to increase in strength with the movement of said motor; means for connecting said controlling-motor with a vacuum-chamber, the fluid-pressure of which is to be controlled; and a valve actuated by said controlling-motor and arranged to vary the capacity of one of said openings with a movement of said motor.

31. In a vacuum-governor, the combination of a regulating-valve; a regulating-motor arranged to influence said regulating-valve, said motor being provided with an intake-opening and exhaust-opening; a controlling-motor, one side of which is exposed to the atmosphere and the other to the pressure of the fluid to be controlled; a counter-pressure device in said controlling-motor opposing the atmospheric pressure and assisting the fluid-pressure arranged to increase in strength with the movement of said motor; means for connecting said controlling-motor with a vacuum-chamber, the fluid-pressure of which is to be controlled; and a valve actuated by said controlling-motor and arranged to vary the capacity of one of said openings with a movement of said motor; and means for adjusting the counter-pressure device to vary the movement of the controlling-motor with a given change of pressure in said connecting means.

32. In a vacuum-governor, the combination of a regulating-valve; a regulating-motor arranged to influence said regulating-valve, said motor being provided with an intake-opening and exhaust-opening; a controlling-motor, one side of which is exposed to the atmosphere and the other to the pressure of the fluid to be controlled; a counter-pressure device in said controlling-motor opposing the atmospheric pressure and assisting the fluid-pressure arranged to increase in strength with the movement of said motor; means for connecting said controlling-motor with a vacuum-chamber, the fluid-pressure of which is to be controlled; a valve actuated by said controlling-motor and arranged to vary the relative capacities of said openings with a movement of said motor and to control the exhaust-passage; and means for varying the valve-action in the opening to vary the relative capacities of the openings after the exhaust-passage is open.

33. In a vacuum-governor, the combination of a regulating-valve; a regulating-motor arranged to influence said regulating-valve, said motor being provided with an intake-opening and an exhaust-opening; a controlling-motor; means for connecting said controlling-motor with a vacuum-chamber, the fluid-pressure of which is to be controlled; and a needle-valve actuated by said controlling-motor and arranged in one of said openings.

34. In a vacuum-governor, the combination of a regulating-motor arranged to actuate the governor, said regulating-motor comprising the cylinder R, piston Q in said cylinder, said piston being exposed on one side to the atmosphere and the other side within the cylinder; a counter-pressure device acting against the atmosphere; a connection with the cylinder R having the intake t and exhaust-passage t'; the needle-valve U controlling the exhaust-passage t' and the controlling-motor comprising the cylinder V, piston W in said cylinder, the spring X arranged against the piston W, one side of the piston being exposed to the atmosphere; and a connection V' in communication with the exhaust-passage t' and cylinder V at the opposite side of the piston from its exposure to the atmosphere.

35. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor actuated by the fluid for varying the relative strength of one of said elements; means influenced by the rarefied fluid to be controlled for varying the pressure on said motor as the pressure of the fluid to be controlled varies, and for intensifying the change of fluid-pressure on the motor over a change of pressure in the controlled fluid.

36. In a vacuum pump-governor, the combination of a centrifugal element and a centripetal element arranged to operate in opposition to said centrifugal element; a motor actuated by a fluid for varying the relative strength of one of said elements; means for connecting said motor with a vacuum-chamber, said motor being arranged to act with a change of pressure in a vacuum-chamber; and means for intensifying the change of pressure on the motor over the change of pressure in the chamber.

37. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor actuated by a fluid for varying the relative strength of one of the elements relative to the other; means for connecting said motor with a vacuum-chamber, the fluid-supply of which is to be regulated said motor being arranged to act with a change of pressure in the chamber; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in the chamber.

38. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element acting in opposition to said centrifugal element; a motor actuated by fluid for varying the strength of one of said elements relatively to the other; means for connecting said motor with a fluid-supply, said motor being arranged to act with a change of pressure in a vacuum-chamber; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in the chamber; and means for controlling the extent of said intensifying action.

39. In a vacuum pump-governor, the combination of a centrifugal element and a centripetal element arranged to act in opposition to said centrifugal element; a motor influenced by the fluid to be controlled for varying the strength of the centripetal element; means for connecting said motor with a vacuum-chamber, said motor being arranged to act with a change of pressure in said means of connection, the fluid-pressure of which is to be controlled; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in said means of connection.

40. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a fluid-actuated motor for varying the strength of one of the elements within the limits of power exerted by the other element; means for connecting said motor with a fluid-supply, said motor being arranged to act with a change of pressure in a vacuum-chamber; and means for intensifying the change of fluid-pressure on the motor over a change of pressure in the chamber.

41. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor for varying the relative strength of said elements, said motor having an intake-passage and an exhaust-passage; means for varying the relative capacities of said openings; and mechanism controlled by the fluid-pressure less than atmospheric pressure for actuating said means.

42. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor for varying the relative strength of said elements; means for connecting said motor with a vacuum-chamber, the fluid-supply of which is to be regulated, said motor having an intake-opening and an exhaust-opening leading to said connection.

43. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor arranged to vary the strength of the centripetal element; means for connecting said motor with a fluid-supply, said motor having an intake-opening and an exhaust-opening; means controlled by fluid-pressure less than atmospheric pressure for varying the capacities of said openings.

44. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor arranged to vary the strength of the centripetal element; means for connecting said motor with a vacuum-chamber, the fluid-supply of which is to be regulated, said motor having an intake and exhaust opening to said means of connection.

45. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element, comprising a plurality of springs, said centripetal element being arranged to act in opposition to said centrifugal element; a motor for throwing said springs into and out of action to vary the strength of the centripetal element; means for connecting said motor with a fluid-supply, said motor having an intake and an exhaust opening; mechanism for varying the relative capacities of said openings; and devices controlled by pressure less than atmospheric pressure for influencing said mechanism.

46. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor for varying the relative strength of said elements; a counter-pressure mechanism varying in strength with a movement of the motor, said motor having an intake and an exhaust passage; and devices controlled by pressure less than atmospheric pressure for varying the capacities of said openings.

47. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a motor for varying the relative strength of said elements, said motor being provided with an intake-opening and an exhaust-opening; a controlling-motor; means for connecting said controlling-motor with a vacuum-chamber, the pressure of which is to be controlled; and a valve actuated by the controlling-motor and arranged to vary the relative capacities of said supply and vent openings.

48. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to the centrifugal element; a regulating-motor arranged to regulate the varying strength of said elements, said motor being provided with an intake and exhaust opening; a controlling-motor; a counter-pressure device on said controlling-motor arranged to increase in strength with a movement of said motor; means for connecting said controlling-motor, the pressure of which is to be controlled; a valve arranged to vary the capacity of one of said openings with a movement of said motor.

49. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element; a regulating-motor arranged to vary the relative strength of said elements; a controlling-motor; a counter-pressure device on said controlling-motor arranged to increase in strength with a movement of said controlling-motor; means for connecting said controlling-motor with a vacuum-chamber, the fluid-supply of which is to be regulated; a valve actuated by said controlling-motor and arranged to vary the capacity of one of said openings with a movement of said motor; and means for adjusting the counter-pressure device to vary the movement of the controlling-motor with a given change of pressure in the means of connection.

50. In a vacuum pump-governor, the combination of a centrifugal element; a centripetal element arranged to act in opposition to said centrifugal element, said centripetal element comprising a plurality of springs; a regulating-motor arranged to actuate said centripetal element and to throw said springs into and out of action to vary the strength of the centripetal element relatively to the centrifugal element, said motor being subjected to atmospheric pressure on one side and the opposite side to a pressure less than atmospheric pressure; a counter-pressure device acting against the atmospheric pressure on said motor, said motor having an intake and exhaust opening; means of connection between said exhaust-opening and a vacuum-chamber, the fluid-supply of which is to be regulated; a controlling-motor having one side exposed to the atmosphere and the other to the fluid-pressure of the means of connection; a connection between said controlling-motor and said means of connection; and a counter-pressure device acting against the atmosphere acting on said controlling-motor; a screw adjustment for said counter-pressure device; an indicating-finger on said screw; and a dial in the path of said finger.

810,110. SASH-LOCK. CHARLES M. EVANS, Carmichaels, Pa. Filed Mar. 22, 1905. Serial No. 251,471.

Claim.—In a sash-fastener, the combination of a casing, the two bolts 6 and 9 mounted in said casing and slidable at right angles to each other, the finger-piece 7 projecting upwardly from the bolt 6 through the top of the casing, the casing having a slot therein in which the finger-piece 7 is adapted to slide, the finger-piece 10 at one side of the casing and carried by the outer end of the bolt 9, and the pin 11 projecting upwardly from the bolt 9 between the ends of the latter and arranged within the casing aforesaid, the bolt 6 being arranged adjacent the bolt 9 whereby the bolt 9 may be rotated so as to cause the pin 11 carried thereby to be thrown into a vertical position in engagement with the bolt 6, the pin 11 when in engagement with the bolt 6 preventing sliding movement of the bolt 9, but permitting free sliding movement of the bolt 6.

810,111. STOCK-WATERING APPARATUS. WILLIAM O. GARRETT, Maryville, Mo. Filed May 4, 1905. Serial No. 258,894.

Claim.—1. The combination of a tank, a valve-casing extending upward from the bottom of the tank and provided with a seat, a valve operating within the casing and provided with a stem extending upward from the same, a float having an opening of greater diameter than the valve-casing and resting upon the bottom of the tank when it is at the limit of its downward movement, and means for loosely connecting the stem of the valve with the float.

2. The combination with a tank having a depending flange, a heating-chamber located beneath the tank and fitting within the said flange, whereby it is interlocked with the tank, a heating device, and a supply-pipe piercing the heating-chamber and the tank and retaining the same in their interlocked relation.

3. The combination of a tank, a heating-chamber located beneath the same, a supply-pipe piercing the heating-chamber and rigidly secured to the tank, and adjustable means carried by the supply-pipe and engaging the heating-chamber.

4. The combination of a tank, a heating-chamber located beneath the same, a supply-pipe piercing the bottoms of the tank and the heating-chamber, a valve-casing arranged on the supply-pipe and engaging the upper face of the bottom of the tank, nuts mounted on the supply-pipe and engaging the lower faces of the bottoms of the

tank and the heating-chamber and clamping the said tank and heating-chamber together, and a valve operating in the valve-casing.

5. The combination of a heating-chamber composed of a bottom and upwardly-extending walls, one of the walls having a door, a tank supported by the walls of the heating-chamber and provided with a chimney-tube fixed to the bottom of the tank, a lamp mounted within the heating-chamber and located beneath the chimney-tube, said lamp being provided with an exteriorly-projecting reservoir, a water-supply pipe piercing the heating-chamber and the said tank and retaining the chimney-tube in position above the lamp, and means connected with the exteriorly-projecting portion of the reservoir for supplying the same with oil.

810,112. AUTOMATIC BELL-SIGNAL FOR RAILROAD-TRACK CROSSINGS. LINDSEY GASKINS, Hamilton, Va. Filed Aug. 14, 1905. Serial No. 274,091.

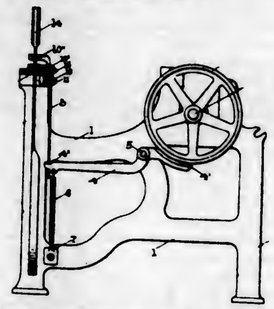
Claim.—1. An automatic railway-signal comprising a push-bar, a tension-spring connected to one end thereof, floating levers pivoted to said bar, a pair of springs connected to the ties and to the lower ends of each lever to maintain their normal floating positions, a crank connected to one end of said push-bar, a frame connected to be swung by said crank, and a bell fixed to the upper end of said swing-frame.

2. An automatic railway-signal comprising a push-bar, a tension-spring connected to one end thereof and a crank connected to the other end of said push-bar, a plurality of floating levers pivoted to said bar, a pair of springs connected to the ties and to the lower ends of each lever to maintain them in their normal floating positions, a swing-frame connected to and rising from said crank and having a yielding or spring function, and a bell fixed to the upper end of said swing spring-frame.

3. An automatic railway-signal consisting of a push-bar arranged upon the ties along the outer side of the rail, a retracting-spring connecting one end of said bar, a bell-carrying frame having a crank connection with the other end of said push-bar, a plurality of floating levers mounted in and movable with said push-bar projecting above and below it, and a pair of coil-springs connected to the lower end of each lever to balance it.

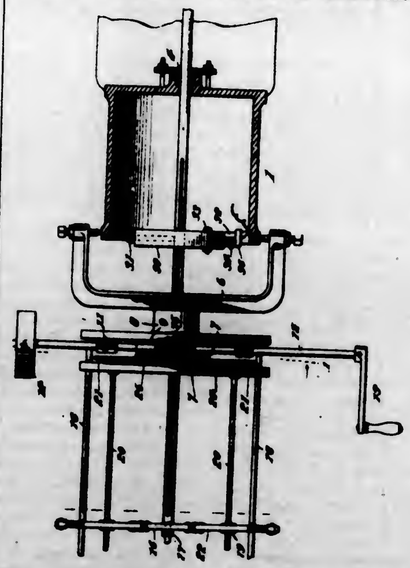
810,113. BRAKE MECHANISM OF LOOMS. ALBERT A. GOSSER, Jr., Worcester, Mass., assignor to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed Feb. 27, 1905. Serial No. 247,417.

Claim.—1. In a loom, mechanism for releasing the brake from the brake-wheel independently of the shipper-lever, said mechanism comprising a pivoted lever connected with the brake-lever, and said brake-lever, an arm carried on said pivoted lever and adapted to engage a stationary part, which part acts to hold said arm from accidental movement, and means for moving said arm to cause it to engage said stationary part, the engagement of said arm with the stationary part causing the movement of the pivoted lever and the release of the brake from the brake-wheel.



2. In a loom, the combination with mechanism for releasing the brake from the brake-wheel independently of the movement of the shipper-lever, said mechanism comprising a pivoted lever connected with the brake-lever, and said brake-lever, a rocking cam-arm carried on said pivoted lever, and having a cam-surface thereon, and adapted to engage a stationary part, which part acts to hold said cam-arm from accidental movement, and means for moving said cam-arm to cause it to engage said stationary part, the engagement of said cam-arm with said stationary part causing the movement of said pivoted lever and the release of the brake from the brake-wheel, of the shipper-lever adapted to engage and move said pivoted lever when said shipper-lever is moved to start the loom, and to hold the brake released from the brake-wheel, and release the cam-arm and allow it to return to its inoperative position.

810,114. CYLINDER-BORING MACHINE. JOSEPH H. GOULDSBERRY, Toutonia, W. Va. Filed Feb. 15, 1905. Serial No. 245,741.



Claim.—1. In combination, a boring-bar, a head adjustable thereon and provided in one side with a recess and in an edge with a threaded opening, means for securing the head to the boring-bar in an adjusted position, a bit seated in the recess of said head and adjustable therein and provided with an offset or shoulder, a set-screw

threaded into the opening extended inward from the edge of the head and adapted to engage with said offset of the bit, and means for securing the bit to the head in an adjusted position.

2. In a tool of the character described, the combination of a framework, guide-rods supported thereby and extended therefrom, feed-screws mounted in said framework, a cross-head slidable upon said guide-rods and comprising movable portions between which said guide-rods and feed-screws are received, feed-nuts coöperating with the feed-screws and confined between the parts of the cross-head, fastening means for securing the parts of the cross-head when closed upon the guide-rods and feed-nuts, a bar rotatably mounted in the framework and cross-head and movable with the latter and slidable in said framework and provided with cutting mechanism, and operating-gearing between said rotatable bar and feed-screws and supported by the said framework.

3. In a machine of the character set forth, a framework comprising spaced members, guide-rods connecting said members and extended therefrom, feed-screws mounted in the framework, a cross-head slidable upon said guide-rods, a bar provided with cutting mechanism and mounted in said cross-head to move therewith and having both rotary and sliding movement in the framework, a driver mounted upon said bar and having a sliding-key connection therewith, pivoted frames mounted coaxially with the feed-screws, and a train of gearing mounted upon each of the pivoted frames and having connection with the respective feed-screws and adapted to be thrown into and out of gear with the aforesaid driver, the pivoted frames, trains of gearing and driver being arranged between the spaced members of the aforementioned framework.

4. A machine of the character described comprising a spider, clamp-screws fitted in the arms of said spider, a framework comprising spaced members, connecting means between said framework and spider, guide-rods connecting the spaced members of the framework and extended therefrom, feed-screws mounted in the framework, a cross-head having movable parts between which are received said guide-rods and feed-screws, feed-nuts confined between the movable parts of the cross-head and receiving the feed-screws, fastening means for securing the movable parts of the cross-head when closed upon the guide-rods and feed-nuts, a boring-bar provided with cutting mechanism mounted in the cross-head and framework and having both rotary and sliding movement with reference to said framework and movable with the cross-head, a driver mounted upon the boring-bar to turn therewith but admitting of said bar having sliding movement therethrough, frames pivoted coaxially with the feed-screws, and trains of gearing supported by said pivoted frames and connected with the respective feed-screws and adapted to be thrown into and out of gear with the said driver, the pivoted frames, trains of gearing and driver being arranged between the spaced members of said framework.

810,115. ABSORBENT BANDAGE AND MATERIAL THEREFOR. WILLARD R. GREEN, Muscatine, Iowa. Filed Feb. 20, 1904. Serial No. 196,729.

Claim.—1. An absorbent material for surgical purposes comprising a plurality of layers, one of which consists of sand or analogous granular material, and means for flushing the same.

2. An absorbent material for surgical purposes, comprising a mass or body of absorbent, a part thereof made up of a granular material treated with a pus solvent.

3. An absorbent material for surgical purposes made up of a body or mass of absorbent comprising fibrous material and a granular material.

4. An absorbent material for surgical purposes made up of a body or mass of absorbent comprising fibrous material and a granular material, the granular material being treated with a pus solvent and the fibrous material with an antiseptic.

5. An absorbent material for surgical purposes comprising a layer of fibrous material, and a layer of granular material intermingled with loose fibers.

6. An absorbent pad comprising a waterproof layer, a granular layer, a fibrous layer between the waterproof layer and the granular layer, an open texture facing for the granular layer, said waterproof layer and facing being drawn together and connected to inclose the granular layer and the fibrous layer.

7. In an absorption-pad, a waterproof layer, a granular layer, a fibrous layer between the waterproof layer and the granular layer, an open texture facing for the granular layer, said waterproof layer and facing being drawn together and fastened to inclose the granular layer and the fibrous layer and flushing means comprising an inlet at one side, and an outlet located at a distance from said inlet.

8. In an absorption-pad of the class specified a receiving and distributing granular member, a receiving and retaining fibrous member, means for connecting and retaining said granular and fibrous members, and means for flushing the interior of the pad while this is in use.

810,116. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,925.

Claim.—1. An absorbent bandage comprising a filling of strands, and a pair of surface layers of different, open-mesh fabric.

2. An absorbent bandage comprising a cover-sheet, a filling of excelsior therein, and a surface formed of a plurality of different, open-mesh fabrics.

3. An absorbent bandage comprising a cover-sheet, an absorbent filling mass therein, and a plurality of surface sheets, one of lesser width than the other.

810,117. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,926.

Claim.—1. In an absorbent bandage, the combination with a mass of absorptive stock, of a side-bracing member having transverse folded portions located within the mass and flexible for permitting the free bending of the bandage while resisting the collapse thereof by sidewise pressure.

2. In an absorbent bandage, the combination with a mass of absorbent material, of a side-bracing member so located as to resist the sidewise compression of the bandage.

3. In an absorbent bandage, the combination with a cover-sheet, of a mass of absorptive material therein, consisting of wood in the form of mingled strands disposed in upper and lower portions, and a flexible side-bracing member located between said portions.

4. In an absorbent bandage, the combination with a relatively compressible absorptive mass, of one or more relatively non-compressible side-brace elements located in the bandage for resisting lateral compression thereof.

5. In an absorbent bandage, the combination with a relatively compressible mass of absorptive material, of a plurality of side-brace elements disposed with their lengthwise dimension located transversely of the bandage, and having flexible connection for combining a series of the side-brace elements into a single member.

6. In an absorbent bandage, the combination with a cover-sheet having a reception-opening, of a relatively compressible absorptive mass in said cover-sheet, and a side-bracing member located

in said mass adjacent to said opening for resisting lateral compression of the mass and the collapse of the said opening.

7. An absorbent bandage comprising an absorbent mass, means for supporting the same, and means for maintaining said mass against sidewise compression and constructed to readily yield in certain directions and to permit the passage of fluid therethrough.

8. An absorbent bandage made up of a mass of absorbent material, a corrugated bracing member located in said bandage, and a cover-sheet.

9. An absorbent comprising a mass of wood in the form of ribbon mingled together and promiscuously arranged forming capillary spaces and chamber-spaces disposed throughout the mass, an inclosure for said mass for retaining the same within bounds, and means for distending said inclosure for preventing the compression of said mass and the collapse of the spaces within the same.

10. An absorbent bandage made up of a body of absorbent material, a corrugated and perforated member located in said bandage, and means for supporting the same.

810,118. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,867.

Claim.—1. An absorbent bandage comprising a cover-sheet and an absorptive mass formed of mingled wood strands.

2. An absorbent bandage comprising a covering, and an absorptive mass of compacted excelsior of different degrees of fineness.

810,119. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,868.

Claim.—1. In an absorbent bandage, the combination with a mass of absorptive material, of a receiving member having therein a series of chambers, and a cellular intermediate member having its cells running all in the same direction, located directly below the said receiving chambered member and between it and the said mass of absorptive material and in engagement one with the other.

2. A bandage comprising a cover-sheet, an absorptive mass therein, a cellular body having its cells running all in the same direction and directly imposed upon such mass and movable relative thereto to scrape the coagulated portions one from the other, a corrugated, perforated body directly imposed upon said cellular body, and an open-mesh fabric upon such corrugated body.

810,120. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,869.

Claim.—In an absorbent bandage, the combination with a cover-sheet, of an absorbent mass contained therein and having the upper portion of such mass formed of relatively coarse woody strands intermingled together and a lower portion of relatively fine fiber, and a chambered, receiving-surface member located above said absorptive mass.

810,121. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,930.

Claim.—1. In a bandage, the combination of a cover-sheet, an open-mesh receiving-sheet, a body of absorbent material within the cover-sheet, a member having throughout it a plurality of cell-spaces opening against such receiving-sheet and against the absorbent, and granular material within said cell spaces and in communication with the receiving-sheet.

2. In a bandage, the combination with a body of absorbent material, of means to maintain the said absorbent material in place and having an opening, a body of sand adjacent to said opening and upon the absorbent material, and means to separate the said body of sand into small portions, each portion lying at such opening.

3. A bandage comprising supporting means, a cellular structure carried thereby, and an absorbent material in each of the cells of said structure.

4. In a bandage, the combination with a sheet having an opening, of a thin open-mesh fabric covering the said opening, absorbent material within the sheet, a body of sand between the absorbent and the opening-cover, and means to distend the said opening and to maintain, at said opening, a surface on the sand of considerable area.

5. In a bandage, the combination with a body of absorbent material, means to hold the same in place, a chambered side-bracing member therein, and sand within and reinforcing the side-bracing member.

6. A bandage comprising supporting means, a body of absorbent material carried thereby, a cellular structure also carried thereby, and a granular absorbent in cells thereof.

7. A bandage comprising supporting means, absorbent material carried thereby, absorbent material of a different kind also carried thereby, and means for separating said last absorbent material into separate bodies or portions one from another.

8. A bandage comprising a cover-sheet, a body of fibrous absorbent material therein arranged to form a chamber-space, and sand or analogous granular material located within said chamber-space.

9. In a bandage, the combination with a body of absorbent material, open-mesh fabric at the opening thereof, means to maintain the fabric at the opening distended, and means carried by said distending means for communicating between such open-mesh fabric and the absorbent material.

10. A bandage comprising an absorbent body, a plurality of organized and separated bodies of sand or analogous granular material therein, and means for carrying the same.

11. A bandage comprising a cover-sheet, an absorbent body therein, a cellular structure thereon, and an open-mesh fabric surrounding such cellular structure.

12. A bandage comprising an absorptive mass, a body having a number of cell-spaces and made up of a number of thin narrow strips arranged to produce cells and adapted for receiving the matter for absorption and for distributing the same to the absorptive mass, and means within said cells for initially absorbing said matter.

13. A member for a bandage comprising a body having a number of cells, said cells being formed by the folding of a strip upon itself, and means to hold the strip in its folded form and to permit longitudinal compression of said member but to prevent longitudinal extension thereof.

810,122. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,931.

Claim.—1. An absorbent bandage, comprising a body of absorbent material having a chamber-space within it, and means for maintaining said chamber-space to permit the passage of fluid therethrough and for preventing the closing of said absorptive material into such chamber-space

2. An absorbent bandage comprising a body of absorbent material substantially tubular in cross-section, means within the tube to maintain the inner walls of such tube from compression, a sheath about said body open at one side, and an open-mesh covering upon said body at the said open side.

3. In a bandage, the combination with a body of loosely-arranged absorbent material, having a chamber within such body, means to prevent the body from being pressed into such chamber, an impervious sheath about the major portion of such body leaving an open side, and a pervious sheath upon the said open side.

4. A bandage comprising a body of absorbent material arranged to form a chamber, an open cage within said chamber, an impervious sheathing covering the sides and body thereof, a pervious sheathing covering the top, and means having cellular passage-ways from such pervious material to the chamber within the cage.

5. In an article of the class described, the combination with a body having a chamber within it and extending longitudinally of such body, an open-mesh receiving-face upon such body and a plurality of passage-ways running from such face to the chamber and transversely disposed relatively thereto.

6. In an absorbent bandage, the combination of a resistant metallic cage, an absorbent about the cage, and a cover-sheet supporting the absorbent.

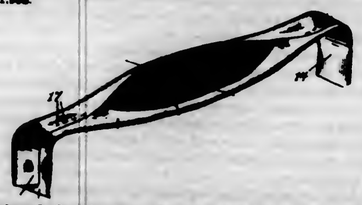
7. In an absorbent bandage, a mass of absorbent material, a chamber-forming cage located interiorly of such mass and having diagonally-disposed ribs affording slight yieldability crosswise of the bandage.

8. A bandage having a body of absorbent material, a chamber-forming cage within the same comprising a member embodying a number of diagonally-disposed crossed ribs, a sinuously-folded ribbon imposed thereon, and means for supporting and holding said elements together.

9. An absorbent bandage comprising a body of absorbent material substantially tubular in cross-section, means within the tube for maintaining the inner walls of the same from compression, and a sheath about said body open at one side.

10. An absorbent bandage comprising a cover having an opening, an absorbent material therein, and a side-bracing member located adjacent to said opening and having a series of perpendicularly-located cells or chambers.

810,123. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,932.



Claim.—1. In a bandage, the combination with a supporting member, of a body of absorbent material therein, a chamber-space-forming cage in the said absorbent material and a body of absorbent material loosely arranged within said cage.

2. In a bandage, the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a coil or helically-formed structure.

3. In a bandage, the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a coil or helically-formed structure, and an absorbent body of material disposed within said structure.

4. In a bandage the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a coil or helically-formed structure having a relatively flat or concaved upper surface.

5. In a bandage the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a plurality of parallelly-located, longitudinally-disposed coil or helically-formed structures.

810,124. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,963.

Claim.—1. A bandage comprising a body of absorptive material, a body of sand or analogous granular material thereon, and a body comprising a number of cells upon such sand body, for passing fluid material to the sand and for preventing sidewise compression of the bandage.

2. A bandage comprising a body of absorbent material, a body of sand or analogous granular material thereon, and means thereon for preventing sidewise compression thereof.

3. A bandage comprising a cover-sheet, a body of fibrous absorbent material therein, a sack or layer of granular material thereon, a side-bracing member on said sack or layer of granular material and having cells, spaces or chambers for the passage of fluid therethrough, and a surface sheet over said side-bracing member.

810,125. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 10, 1904. Serial No. 211,934.

Claim.—1. In an absorbent bandage, the combination of a body of absorbent material, a covering therefor, and an absorbent-retaining and bandage-side-bracing member located between the covering and said absorbent material.

2. An absorbent bandage comprising a cover-sheet, a coil-formed cage located therein, and absorbent material located within said cage, the organization being such that the cage incloses the absorbent material and the cover-sheet incloses the cage.

3. An absorbent bandage comprising a cover-sheet having an opening, a coil or helically-formed cage within said cover-sheet, absorbent material substantially all of which is located within said cage, the upper surface of which cage is of different formation from the under surface, and one or more surface sheets extending across the opening of the cover-sheet.

4. In an absorbent bandage, a retaining member comprising a plurality of flexible coils formed with their upper portions depressed, combined with an absorbent mass all substantially contained within said retaining member, and a surface sheet extending over the retaining member, whereby an open space is normally formed between said surface sheet and said retaining member with the absorbent material therein.

810,126. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 16, 1904. Serial No. 211,993.

Claim.—1. In an absorbent bandage, the combination with a side-bracing member constructed with transversely-disposed spaces, of an absorbent mass formed in a strand and this folded to lie in said spaces, the folds of such absorbent mass forming cushion edges along the side-brace member.

2. In an absorbent bandage, the combination with a side-bracing member constructed with transversely-disposed spaces above and below said member in alternation, of an absorbent mass forming a strand and folded to lie in said spaces and having its folded ends forming cushion edges along the sides of the side-brace member.

3. In an absorbent bandage the combination of a member folded to form transversely-located spaces or channels, and an absorbent material in each of said transverse spaces or channels.

4. In an absorbent bandage, the combination with the chamber-space member, of a mass of absorbent material below said member, a strand of absorbent material disposed in transverse folds and located within the spaces of said chamber member, and supporting means for retaining said members assembled together.

5. In an absorbent bandage, the combination with a containing cover-sheet, of a lower mass of absorptive material contained in and supported by said cover-sheet, and a combined absorptive and transmitting device located above said lower mass and comprising a body of absorptive material and a space member having a series of spaces formed and separated by successive back-and-forth bends of the space member for containing the absorptive material of such combined member and to prevent such absorptive material from being subjected to undue compression.

6. In an absorbent bandage, the combination with a flexible space member consisting of a sheet of relatively resistant material folded to form successive transversely-disposed spaces and having openings communicating between said spaces, of an absorbent mass in the form of an extended strand disposed in said spaces, a mass of absorbent material below said space member, and means for retaining said member and the absorbent material below the same assembled together.

7. In an absorbent bandage the combination of a member having transversely-located spaces or channels, and one or more twisted strands of absorbent material disposed in said transverse spaces.

810,127. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 16, 1904. Serial No. 211,993.

Claim.—1. A bandage comprising an absorbent, a number of members each having a plurality of cell-spaces imposed thereon, and means effective on the movement of the wearer to cause the said members to move one relative to the other and relative to the absorbent.

2. A bandage comprising an absorbent, means to support the same and having securing members, and a number of members having a plurality of cell-spaces and alternately connected to the respective securing member.

3. A bandage comprising an absorbent, means to support the same and having securing members, a series of superimposed members each having a plurality of cell-spaces and some of which are connected to the respective securing members and some of which are not so connected whereby upon movement of the bandage the cell-space members will slip one upon the other.

4. A bandage comprising an absorbent, a cover-sheet to contain the absorbent and having securing members at its ends, a number of members each having a plurality of cell-spaces the cell-spaces being differently located in the respective members, and said members having dissimilarity in width and being connected to the securing members.

5. A bandage comprising an absorbent mass, a cover-sheet surrounding and supporting the same and having a receiving-opening, and side-bracing means within the sheet at such opening to prevent the collapse of the opening and comprising a plurality of perforated plates imposed one upon the other and organized to permit their independent movement incident to change in side pressure upon the bandage.

6. A bandage comprising a body of absorptive material, means to inclose and support the same and provided with an opening, a side-bracing member comprising a plurality of perforated members adapted to move one upon the other and located at said opening and having a portion of the absorptive body between their sides and the casing.

7. A bandage comprising an absorbent body, a cover-sheet therefor having a receiving-opening, and side-bracing means within the sheet to prevent the collapse of the opening or bandage and comprising a plurality of perforated plates or members located in layers, and one or more having a different arrangement or construction from its companion member or members.

810,128. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 16, 1904. Serial No. 211,997.

Claim.—1. A bandage comprising a body of absorptive material, a cover therefor provided with an opening, a member within said opening and provided with a series of cells or chamber-spaces, and absorptive material winding through the same, and presenting portions toward the opening of the bandage and toward the absorptive material respectively.

2. In a bandage, the combination with a cover-sheet, of a body having absorptive material therein, a member comprised of sheet material and bent upon itself to form a series of chamber-spaces, and strands of fibrous absorbent material wound about and through such member whereby some of the said spaces remain open and some of the same are partially filled with such absorbent strands.

3. An absorbent bandage, comprising a cover-sheet having an opening and a cell-spaced member adjacent to said opening, and having three longitudinal zones of cell-spaces, the inner zone of which is open and the cells in the side zones of which are partially closed by absorbent material.

4. A bandage comprising a cover having an opening, a framing member located in said cover, and strands of absorbent material wound from top to bottom around parts of such framing member.

5. A bandage comprising a cover provided with an opening, a framing member having a series of elongated walls forming cells or troughs located in said cover, and strands of absorbent material wound around some or all of the ends of such framing member from top to bottom.

6. A bandage comprising absorptive material, and a folded framing member therein having a series of alternately-located troughs or cells, some or all of which have a part thereof provided with either a bottom or a top wall.

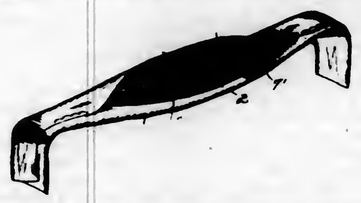
7. A bandage comprising absorptive material, and a folded framing member therein having a series of alternately-located troughs or cells, some or all of which have a part thereof provided with either a bottom or a top wall, and some or all of which portions having a top or bottom wall are also provided with an end wall or walls.

8. A bandage comprising a cover-sheet having an opening, a mass of absorptive material within said cover-sheet, a member between said absorptive material and said opening and having a number of cells or chambers, some closed toward said opening and open toward the absorptive mass, and some open toward said opening and closed toward the absorptive mass, and some also open toward both the said opening and absorptive mass, and fibrous absorptive material traversing some of said cells or chambers.

9. A bandage comprising a cover-sheet, one or more strands of absorbent material located therein and each folded upon itself a relatively large number of times, and means located between the folds of said strands for separating them.

10. A bandage comprising a cover-sheet, a plurality of strands therein, parts of one strand crossing parts of another, and means for separating one strand from another at various points throughout the length thereof.

810,129. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 16, 1904. Serial No. 212,997.



Claim.—1. An absorbent bandage comprising supporting means, and an absorbent material carried thereby and made up of fibers or strands located in layers, substantially all of the fibers or strands of one layer running lengthwise of the bandage and substantially all the fibers or strands of the other layer running crosswise thereof.

2. An absorbent bandage comprising supporting means, and an absorbent material carried thereby and made up of fibers or strands located in layers, substantially all of the fibers or strands of one layer running lengthwise of the bandage and substantially all the fibers or strands of the other layer running crosswise thereof, the fibers or strands of one or both layers being twisted.

3. An absorbent bandage comprising supporting means, and an absorbent material carried thereby and made up of fibers or strands located in layers, substantially all of the fibers or strands of one layer running lengthwise of the bandage and substantially all the fibers or strands of the other layer running crosswise thereof, the fibers or strands of one or both of the layers being folded upon itself a plurality of times.

4. An absorbent bandage comprising supporting means, and an absorbent material carried thereby and made up of fibers or strands located in layers, substantially all of the fibers or strands of one layer running lengthwise of the bandage and substantially all the fibers or strands of the other layer running crosswise thereof, the fibers or strands of one or both layers being twisted and folded upon itself a plurality of times.

5. An absorbent bandage comprising supporting means, and an absorbent material carried thereby and made up of woody or analogous fibers or strands located in layers, substantially all of the fibers or strands of one layer running lengthwise of the bandage and substantially all the fibers or strands of the other layer running crosswise thereof, and the strands or fibers of one or both of the layers being twisted to form a plurality of members located side by side.

6. An absorbent bandage comprising supporting means, and an absorbent fibrous material carried thereby and made up to form a plurality of twisted rope-like members located side by side

7. An absorbent bandage comprising supporting means, and an absorbent fibrous material carried thereby and made up to form a plurality of twisted rope-like members located side by side and disposed transversely of the supporting member.

8. An absorbent bandage comprising supporting means, and a mass of fibrous absorbent material carried thereby and twisted into one or more rope-like members each folded upon itself a plurality of times, one or more of which members is located transversely of the supporting means.

9. A bandage comprising a cover-sheet, an absorbent material located therein in a comparatively loose mass, and an absorbent material twisted and folded into a plurality of rope-like members.

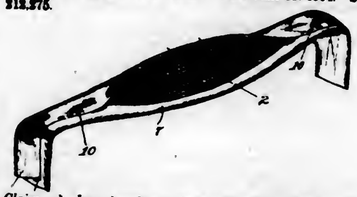
10. A bandage comprising a cover-sheet, an absorbent material located therein in a comparatively loose mass, and an absorbent material twisted and folded into a plurality of rope-like members and running transversely of the cover-sheet.

11. An absorbent bandage comprising supporting means, an absorbent material carried thereby and comprising one or more strands each folded upon itself a plurality of times and running lengthwise of the cover-sheet, and one or more strands each folded upon itself a plurality of times and running crosswise of the cover-sheet.

12. An absorbent bandage comprising a cover-sheet, an absorbent material located therein and twisted and folded upon itself a number of times lengthwise of the cover-sheet, and an absorbent material twisted and folded upon itself a number of times crosswise of the cover-sheet.

13. In a bandage the combination of a body of absorptive material, a cover-sheet therefor having an opening, a plurality of surface sheets extending across said opening, one having its edges extending between the absorptive material and the other having its edges overlying the cover-sheet.

810,130. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,275.



Claim.—1. In a bandage, the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a number of transversely-disposed coils of wire.

2. In a bandage, the combination with a supporting member, of a body of absorbent material therein, and a chamber-space-forming member comprising a number of transversely-disposed coils having greater diameter at the sides than at the center of the bandage.

3. In a bandage, the combination with a supporting member, of an absorptive mass therein, a space-forming member comprising a number of coils transversely disposed, and having a sinuous member resting thereon, and constituting a side brace.

4. An absorbent bandage comprising a supporting member, absorbent material therein, a series of coil-springs to press the same toward the sides and to form a chamber-space therein, and a side-bracing member upon said coil-springs.

5. In a bandage, the combination with a mass of absorptive material, of transversely-located means for supporting the same, a chamber-space-forming member within the absorptive mass, and comprising a number of helically-wound bodies, and a side-bracing member for said bandage.

810,131. ABSORBENT BANDAGE. WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,276.

Claim.—1. An absorbent bandage comprising an absorptive mass, a plurality of members imposed thereon and each provided with chambers or spaces located transversely of the bandage, and a member also having cells or spaces located transversely to the chambers or spaces of its companion members, and separating said first members.

2. An absorbent bandage made up of an absorptive material and a plurality of members having an organized arrangement of cells or chambers, a series of which are located transversely to a series of companion cells or chambers.

3. A bandage comprising a cover-sheet, a body of absorptive material having a chamber-space within it and a corrugated member within such chamber-space having coarse-mesh fabric fastened to its upper side, and a coarse-mesh receiving fabric at the opening of the cover-sheet and adjacent to the fabric upon the corrugated member.

4. In a bandage, the combination with a cover-sheet having an opening, of a mass of absorptive material within the cover-sheet and having a chamber-space located at such opening, a member adapted to brace such opening from sidewise closure and yieldable transversely, a cell-space-forming member beneath the same and readily flexible, and compressible longitudinally and transversely of the bandage, but non-compressible perpendicularly, and a member between such cell-space member and the absorptive material and comprising a folded perforated sheet having transverse troughs, some open directly to such cell-spaces and some open directly to the absorptive material and yieldable upon lines transverse of the bandage.

5. A bandage comprising a supporting member and a mass of material having an organized arrangement of coacting and communicating cells or chambers.

6. A bandage made up of a cover-sheath, an absorptive material so carried therein as to form a chamber, and means located in said chamber and dividing it up into an organized series of cells or spaces.

7. A bandage made up of a cover-sheath, an absorptive material so carried therein as to form a chamber and means located in said chamber and dividing it up into an organized series of cells or spaces, some of which are readily compressible in one direction but not in another, while others of which are readily compressible in a direction different from that in which their companion cells or spaces are compressible.

8. An absorbent bandage comprising a supporting member having within it an absorbent mass of material having unorganized interstices, and a mass of material having an organized series of cells or chambers, a part of such cell or chamber formed mass being so located as to keep the supporting member distended throughout a portion thereof to permit the passage of fluid to the absorbent mass.

9. An absorbent bandage made up of a mass of material having a series of capillary interstices for receiving the more fluid parts of the material for absorption and an organized cell-spaced means having comparatively larger cells for receiving the thicker fluids and chamber-cells for receiving and retaining the coagulative portions, the organization being such that one series of cells or chambers is located transversely to another.

10. In an absorbent bandage, the combination with a lower member consisting of absorptive material, of an upper member having chambers communicating with each other through openings for ventilation and for the passage of fluids and comprising resistance portions disposed transversely thereof for side bracing the bandage, and a flexible cellular and laterally-compressible intermediate member.

11. In a bandage, the combination with a mass of absorptive material, of a cover-sheet to support the same, a receiving-sheet of open-mesh material, a cell-spaced body in such absorptive mass, and a body having transverse corrugations disposed upon such cell-spaced body.

12. In a bandage, the combination with a mass of absorptive material, of a body comprising cells therein, a body comprising transverse passages upon its respective sides and intersected by perforations and resting upon such cellular body, portions of the absorptive mass being disposed at the ends of such chambers.

13. In an absorbent bandage, the combination with a mass of absorptive material, of a member supported thereabove and consisting of a sheet of material shaped to form two series of chambers, one series above and the other series below such sheet.

14. In an absorbent bandage, the combination with a cover-sheet having a receiving-opening, of a lower member therein consisting of a mass of absorptive material, and an upper member situate at said opening and comprising a series of chambers having openings communicating downwardly between said chambers and the absorbent material, and also having openings communicating laterally between successive chambers whereby said chambers serve the purpose of conduits for transmitting fluids downwardly to the lower member and also serve as means for ventilation of the bandage.

15. In a bandage, the combination with a body of absorptive material and a member thereabove comprised of a perforated corrugated sheet having a coarse-mesh fabric secured upon the summits of the corrugations.

810,132. **ABSORBENT BANDAGE.** WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,377.

Claim.—1. In a bandage, the combination with a supporting member, of an absorptive member comprising a rope formed of fibrous absorbent, and a series of troughs about which the rope is folded.

2. In a bandage, the combination with a supporting member, of an absorptive member comprising a rope formed of fibrous absorbent, and a series of perforated troughs about which the rope is folded transversely of the bandage.

3. In a bandage, the combination with a cover-sheet, of a body of absorptive material therein in the form of a rope folded upon itself a number of times, side bracing members in the form of troughs between some or all of the folds of the rope, and a body of absorptive material below such rope and side-bracing members.

4. In a bandage, the combination with a supporting member, of a body therein comprising a rope folded upon itself and trough-like receiving and distributing chamber-space-forming members between the folds, and a similarly-formed body imposed thereon.

5. In a bandage, the combination with a supporting member of a mass of absorbent therein, a rope folded upon itself and lying upon such mass and having trough-like receiving and distributing chamber-space-forming members between the folds and a similarly-formed body imposed thereon, having the absorbent members overlying the chamber-space-forming members in the first-mentioned series.

810,133. **ABSORBENT BANDAGE.** WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,378.

Claim.—1. A bandage comprising a sheet of absorptive material folded upon itself in lines transversely disposed to the length of the bandage, and having its various layers disposed perpendicularly to the bandage.

2. A bandage comprising a sheet of absorptive material folded upon itself in lines transversely disposed to the length of the bandage, and having its various layers disposed perpendicularly to the bandage, and side-bracing members between some or all of the layers.

3. A bandage comprising a sheet of absorptive material folded upon itself in lines transversely disposed to the length of the bandage, and having its various layers disposed perpendicularly to the bandage, and chamber-spaces between some of the folds.

4. An absorptive bandage, having means to support the same, of a body of absorptive material therein, comprising a sheet, one portion of which is made of relatively coarse compacted wood strands, and the other portion of which is made of a relatively fine compacted stock, the sheet being folded upon itself to form a number of folds, the planes of the layers whereof are perpendicularly disposed to the bandage and transversely thereto, and corrugated cell-space members between the folds.

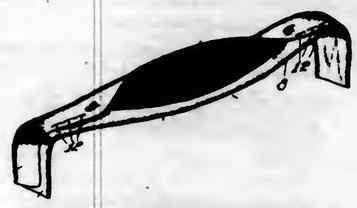
5. In a bandage, the combination with a body of absorptive material, comprising a sheet of woody strands folded upon itself and having corrugated members interposed between the folds at the receiving-face of the bandage.

6. A bandage comprising supporting means, and a sheet or layer of absorbent material folded upon itself with its several layers perpendicularly disposed with relation to said supporting means.

7. A bandage comprising supporting means, a sheet or layer of absorbent material folded upon itself with its several layers perpendicularly disposed with relation to said supporting means, and means for separating some or all of the folds.

8. A bandage comprising a cover-sheet having an opening, and a sheet or layer of absorbent material folded upon itself transversely to the length of the cover-sheet, with its various layers disposed perpendicularly to the cover-sheet and with some of the folds thereof toward the opening of the cover-sheet.

810,134. **ABSORBENT BANDAGE.** WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,379.



Claim.—1. A bandage comprising a supporting cover-sheet, a body of absorbent material therein, and a perforated receiving layer, made up of an absorptive mass of material, upon said body.

2. In a bandage, the combination with a cover-sheet, of a mass of absorptive material therein arranged in the form of folded layers, the lines of the folds running longitudinally of the bandage, and the layers being some of them perforated to produce a number of disconnected chamber-spaces located at various points within the said mass.

3. A bandage comprising a cover-sheet, an absorptive body within said sheet comprised of mingled woody strands and vegetable fiber, and so organized that the major portion of such mass will be composed of coarse stock and the upper or receiving layer or portion of a finer grade of stock.

4. In a bandage, the combination with means for supporting the mass, of a mass of fibrous absorbent material supported thereby and arranged in layers, the upper layer whereof is of a finer stock than the other layers, and some of which layers are provided with perforations making cell-spaces, and a side-bracing member comparatively unyielding transversely of the bandage and imposed between some of said layers and provided with openings.

5. An absorbent material for a bandage, arranged in the form of layers, each made up of a mass of absorptive stock, one or more of such layers having perforations to form a number of chambers or cell-spaces located at various points within the mass.

6. In a bandage, the combination with a cover-sheet having an opening, of an absorptive mass, composed of vegetable fiber and woody strands within said cover-sheet and comprising a perforated receiving layer adjacent to such opening, and a sheet arranged in a series of folds having the folds longitudinally of the bandage and provided with a number of cell-spaces, such sheet being made of a coarser stock than the receiving layer, an open-mesh cover-sheet at the said opening and leaving a chamber-space between it and such receiving layer, and a perforated side-bracing and distributing member below such perforated receiving member.

810,135. **ABSORBENT BANDAGE.** WILLARD R. GREEN, Muscatine, Iowa, assignor to The American Absorbent Fiber Company, Portland, Me., a Corporation of Maine. Filed June 13, 1904. Serial No. 212,380.

Claim.—1. In a bandage, the combination with a supporting member, of an absorbent member comprised of a composite sheet having cell-spaces within it bent upon itself a number of times.

2. A bandage comprising a supporting member, an absorbent member comprising two sheets of absorbent material having a sheet of corrugated material interposed between them, and such composite sheet bent upon itself a number of times.

3. A bandage comprising a supporting cover-sheet, an absorbent member comprising two sheets of absorbent material having a sheet of corrugated material interposed between them, and such composite sheet bent upon itself a number of times and resting edgewise upon the cover-sheet and the cell-spaces formed by the corrugated sheet occupying positions perpendicular to the face of the bandage.

4. An absorbent member for a bandage comprising layers or sheets of absorbent material combined with a corrugated sheet and folded upon itself a number of times, a fastening device at points in the member, whereby the excess of material had at a short fold of one sheet will be compensated for at the long fold of the same sheet.

5. A bandage comprising a plurality of sheets or layers of absorbent material folded upon itself a number of times and fastened at every third fold.

6. An absorbent material for surgical purposes, comprising a composite member made up of a plurality of layers fastened together, one of which is of cellular construction.

7. A bandage comprising a cover-sheet having an opening, and one or more layers of absorbent material folded upon itself a number of times and disposed edgewise in said sheet with one of its free edges toward said opening.

810,136. **ABSORBENT MATERIAL.** WILLARD R. GREEN, Muscatine, Iowa. Filed July 25, 1904. Serial No. 217,069.

Claim.—1. An absorbent material for surgical purposes comprising woody strands, and fiber intermingled therewith.

2. An absorbent material for surgical purposes comprising excelsior, and a vegetable fiber such for instance as cotton or linen fiber intermingled therewith.

3. An absorbent material for surgical purposes composed of two kinds of stock mingled together and consisting one of relatively large and rigid strands of ribbon-like formation, and the other of fiber distributed through the interior of the mass within spaces formed by the relative rigid strands, so that the strands keep open and expanded the fiber component of the mass, the two kinds of stock together forming the capillary and fluid-retaining interstices of the mass.

4. An absorbent material for surgical purposes consisting of a mass of woody or analogous strands intermingled with a mass of vegetable fiber such as cotton or linen fiber, the woody strands acting as a frame to maintain the fiber mass distended and against collapse upon the absorption of moisture.

810,137. **ABSORBENT MATERIAL.** WILLARD R. GREEN, Muscatine, Iowa. Filed July 25, 1904. Serial No. 217,070.

Claim.—1. As an article of manufacture, an absorbent body for surgical purposes consisting of a main portion composed of woody strands and one or more surface layers composed of fiber.

2. As an article of manufacture, an absorbent body for surgical purposes consisting of a main portion composed of a mixture of excelsior and fiber, and one or more surface layers of fiber upon said mass.

3. As an article of manufacture an absorbent mass for surgical purposes consisting of a main portion comprising intermingled woody strands of various sizes, and a surface layer composed of vegetable fiber, such as cotton or linen fiber

4. An absorbent material for surgical purposes consisting of a highly-absorbent mass of mixed strands and fiber, and a surfacing of cementitious fiber upon one side, and a vegetable fiber upon the other side.

5. As an article of manufacture, an absorbent mass for surgical purposes consisting of a body made up of intermingled woody strands or ribbons of various sizes, and a fibrous or filamentous surface layer on one or more faces thereof, the whole arranged in sheet form and partially divided into blocks or sections to permit ready detachment thereof.

810,138. ABSORBENT MATERIAL. WILLARD R. GREEN, Muscatine, Iowa. Filed July 26, 1904. Serial No. 217,971.

Claim.—An absorbent material for surgical purposes comprising commingled excelsior and wood fiber.

810,139. ABSORBENT MATERIAL AND FIBER-STOCK THEREFOR. WILLARD R. GREEN, Muscatine, Iowa. Filed July 26, 1904. Serial No. 217,972.

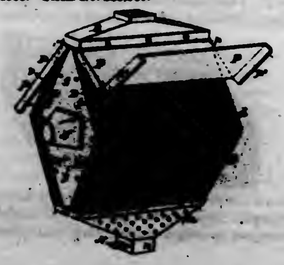
Claim.—1. An absorbent material for surgical purposes comprised of a mass of relatively fine, bent or curved, fibrous-paper clippings.

2. An absorbent material for surgical purposes comprising a mass made up of woody strands intermingled with fibrous-paper fragments or clippings.

3. An absorbent material for surgical purposes comprised of a mass of mixed excelsior and bent or curved fibrous-paper clippings cut from a sheet of material.

4. An absorbent for surgical purposes comprising a body of minute masses of fibrous material each having reversed curved faces to open up to the outside of the interspaces in each mass, mingled with a framework-forming absorbent.

810,140. COPPER-COOLER. HARRY HAHER, Chicago, Ill. Filed Sept. 27, 1905. Serial No. 280,267.

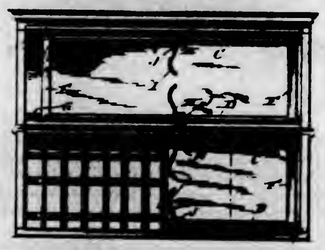


Claim.—1. In an apparatus of the class described, the combination of a leading-in spout and pyramidal funnel with inclined baffle-plates therein, downwardly-divergent and then convergent walls of fine wire-netting to form zigzag passages, a hopper into which said passages lead, the inner walls forming an air-chamber between said zigzag passages, and an air-pipe issuing from the middle portion of one end of said air-chamber, substantially as described.

2. In an apparatus of the class described, the combination of an upper funnel and inclined baffle-plates therein, a bottom hopper and a gate to control it, and between said upper funnel and bottom hopper, the wire-netting walls of two zigzag passages leading downwardly from said funnel into the bottom hopper, the walls of a diamond-shape air-chamber in the center, an air-pipe issuing from one side of said air-chamber, and a door in the opposite side, substantially as described.

3. In an apparatus of the class described, the combination of an upper funnel and inclined baffle-plates therein, a bottom hopper and a gate to control it and between said upper funnel and bottom hopper, the wire-netting walls of two divergent and then convergent passages leading downwardly from said funnel to the bottom hopper and foldable shutters hinged to rest upon the walls of the divergent passages, substantially as described.

810,141. BOOK-SUPPORT. ROBERT B. HALSELL and ALEXANDER B. CAMPBELL, Laurel, Miss. Filed May 5, 1905. Serial No. 259,614.



Claim.—1. In combination with a bookcase, a pair of rods extending longitudinally thereof; means for holding said rods within the case and an adjustable finger mounted upon each rod.

2. In combination with a bookcase, a frame adjustably secured therein and extending longitudinally thereof; and means carried by the frame for bearing against the last book of a series placed within the case.

3. In combination with a bookcase, a frame adjustably secured therein and extending longitudinally thereof; and a pair of fingers extending outwardly from the frame toward the front of the case, said fingers being adjustable longitudinally of the frame.

4. In combination with a bookcase, a pair of rods; a spring for securing each rod in place within the case; and an adjustable finger mounted upon each of said rods.

5. In combination with a bookcase, a frame having two longitudinally-disposed rods; a spring cooating with each rod to hold the frame in place; and a finger mounted upon and adjustable lengthwise of each rod.

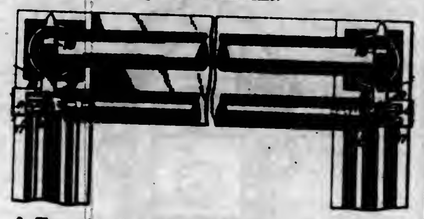
6. In combination with a bookcase, a frame mounted therein, said frame comprising two longitudinally-disposed rods, and members connecting said rods; a pair of springs mounted upon the ends of the rods; and a bearing-finger mounted and longitudinally adjustable upon each of said rods.

7. In combination with a bookcase, a pair of longitudinally-disposed rods; connecting members for said rods; a coiled spring mounted upon one end of each of said rods; and a bearing-finger also mounted upon each of said rods, each finger having a coiled portion which encircles its rod, substantially as described.

8. In combination with a bookcase, means adjustably mounted therein and extending longitudinally thereof for limiting the movement of the books rearwardly within the case; and means adjustably mounted upon said first-mentioned means for holding the books in close contact with each other, substantially as described.

810,142. SHADE-ROLLER AND CURTAIN-POLE SUPPORT. JOSEPH KERR, Gibsonburg, Ohio. Filed Oct. 26, 1905. Serial No. 284,288.

Claim.—1. The combination with frame-embracing clamp members having overlapping slidably-associated shanks, of a pole-supporting bracket located transversely of the overlapped shanks, a roller-supporting bracket having a portion disposed alongside the overlapped shanks and adjustable with respect thereto, and a holding-bolt passing through the overlapped portions of the shanks, the pole-supporting bracket, and the roller-supporting bracket portion and constituting a clamp for all of the same.

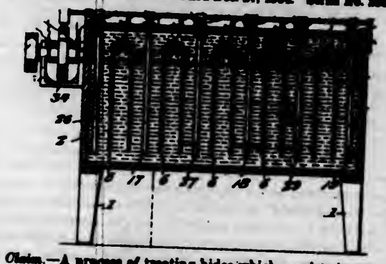


2. The combination with frame-embracing clamp members having overlapping slidably-associated shanks that are provided with longitudinally-disposed slots, of a pole-supporting bracket having an offset lower end disposed transversely of the shanks and provided with a slot, a roller-supporting bracket comprising an outstanding ear having an offset portion disposed longitudinally of the shanks and across the pole-supporting bracket, said offset portion having a slot, a holding-bolt passing through the various slots, and a clamping-nut threaded upon the bolt.

810,143. PHOTOGRAPHIC MASK. PERCY A. HELLBORN, Bushy, Scotland. Filed Apr. 24, 1905. Serial No. 257,262.

Claim.—An envelop or pocket within which bordered photographs may be printed, composed of a combined border-negative and picture-mask and a border-mask with picture-opening attached together in exact register as described.

810,144. PROCESS OF TREATING HIDES. FRANK B. HEMENWAY, Newcastle, Pa., assignor of two-thirds to Joseph M. Flannery and James J. Flannery, Pittsburg, Pa. Filed Dec. 27, 1904. Serial No. 238,264.



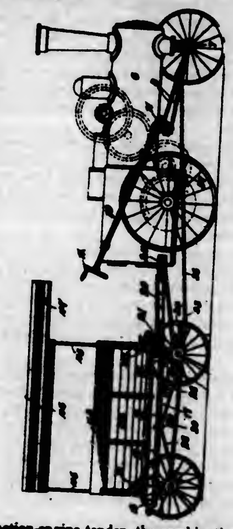
Claim.—A process of treating hides which consists in suspending a plurality of hides between a plurality of electrodes in such manner that each hide is disposed between one pair of electrodes, passing an electric current transversely through each hide, and reversing the direction of the current at suitable intervals.

810,145. TRACTION-ENGINE TENDER. CHARLES T. HITNER, Ringwood, Ohio. Filed June 24, 1905. Serial No. 266,797.

Claim.—1. In a traction-engine tender, the combination with a running-gear including spaced pivoted axles, of a reservoir mounted on the running-gear, and means for connecting both axles to the steering-gear of a traction-engine to effect their pivotal movement.

2. In a traction-engine tender, the combination with a running-gear including spaced pivoted axles, of a reservoir mounted on the running-gear, means for connecting the tender to a traction-engine, and means for effecting a differential turning movement of said axles.

3. In a traction-engine tender, the combination with running-gear including spaced pivoted axles, of means for connecting the running-gear to a traction-engine, and means connected to the axles at different distances from their pivot-caps to effect a differential movement of said axles, said means being attachable to the turning-gear of a traction-engine.



4. In a traction-engine tender, the combination with running-gear including a frame and spaced axles pivoted between their ends to the frame and having walls on opposite sides of their pivot-axes, of steering devices connected to both axles on opposite sides of their pivots, means for connecting said devices to the steering-gear of a traction-engine, and a reservoir mounted on the running-gear.

5. In a traction-engine tender, the combination with running-gear including spaced pivoted axles, of steering-cables connected to both axles on opposite sides of their pivots and connected to each other, and means for connecting said cables to the steering-gear of a traction-engine.

6. In a traction-engine tender, the combination with running-gear including a supporting-frame and spaced axles pivoted thereto, of steering-cables connected to both axles on opposite sides of their pivots, the corresponding cables of said axles being connected, and other cables for connecting said corresponding cables to the steering mechanism of a traction-engine.

7. In a traction-engine tender, the combination with running-gear including a supporting-frame and a plurality of wheeled axles, of spaced draft-links pivoted to the frame and having their front ends spaced apart, and means for pivotally connecting the front spaced ends of said links to the spaced portions of a traction-engine.

8. In a traction-engine tender, the combination with running-gear including a supporting-frame having a bolster, of wheels for supporting said frame, spaced links hinged to the bolster at their rear ends, and means for pivotally connecting the front ends of the links to a traction-engine.

9. In a traction-engine tender, the combination with running-gear including a supporting-frame having a bolster, axles pivoted to the supporting-frame, wheels journaled on the axles, spaced links hinged to the bolster at their rear ends, means for pivotally connecting the front ends of the links to a traction-engine, and means for connecting the said axles to the steering-gear of said engine.

10. In a traction-engine tender, the combination with running-gear including a reach-bar, bolsters mounted transversely on said bar, and axles pivoted to the front and rear ends of the reach-bar, of wheels journaled on the axle, spaced links pivotally connected to the front bolster and having means for attachment to a traction-engine, braces connecting the links, and means attached to both axles for connecting the same to the steering-gear of each engine.

11. In a traction-engine tender, the combination with a reach-bar having bolsters, of a reservoir mounted on the bolsters, axles pivoted to the reach-bar, means for connecting one of the bolsters to a traction-engine, and means for connecting the axles to the steering-gear of a traction-engine.

12. In a traction-engine tender, the combination with a reach-bar having bolsters, of a reservoir mounted on the bolsters, axles having ball-and-socket connections, respectively, with the front and rear ends of the reach-bar, braces connecting the axles and the reach-bar, links for pivotally connecting the front bolster to a traction-engine, and cables attached to both axles and having means for connecting the same with the steering-gear of a traction-engine.

13. In a traction-engine tender, the combination with a wheeled running-gear, of a reservoir mounted thereon, a roof supported over the reservoir and having a hood projecting from one end, and means carried by the end having the hood for connecting the running-gear to a traction-engine.

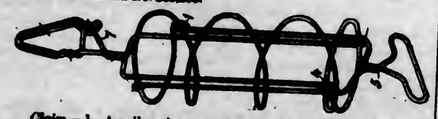
14. In a traction-engine tender, the combination with a wheeled running-gear, of a reservoir mounted thereon, a roof supported over the reservoir and having a hood projecting from one end, spaced links pivotally connected to the end of the running-gear beyond which the hood extends, and means for pivotally connecting the links to a traction-engine.

15. In a traction-engine tender, the combination with running-gear including bolsters, of a reservoir mounted on the bolsters, a roof supported over the reservoir and projecting beyond the front end of the same, means connected to the front bolster for pivotally attaching the same to a traction-engine, axles pivoted to the running-gear, and means for connecting both axles to the steering-gear of a traction-engine.

16. In a traction-engine tender, the combination with running-gear comprising a reach-bar, bolsters mounted thereon, and axles pivoted therebetween, of a reservoir mounted on the bolsters, a roof supported above the reservoir, wheels journaled on the axles, links pivoted to the front bolster and having means for pivotally connecting their front ends to a traction-engine, cables connected to the axles and to each other, and other cables connected to said first-mentioned cables and arranged to be secured to the steering-gear of the traction-engine.

17. In a traction-engine tender, the combination with a supporting-frame, of spaced axles pivoted thereto, means for connecting the frame to a traction-engine, and means for turning the axles, said means comprising devices arranged to be connected to the steering-gear of the engine, said devices being connected to the axles and closer to the pivot-axis of one than to the other to effect a differential turning movement of said axles upon the movement of the steering-gear.

810,146. COIL-SPRING. ELI HOGAN, Portland, Oreg. Filed June 14, 1905. Serial No. 265,266.



Claim.—1. A coil-spring connection device, consisting of a single piece of wire, formed in two looped straining or tension elements, and a coiled compression-spring held by its opposite ends between them.

2. A coil-spring connection device, consisting of a single piece of wire formed into two looped straining or tension elements, and a coiled compression-spring held by its ends between them, the straining or tension elements passing through the compression-spring.

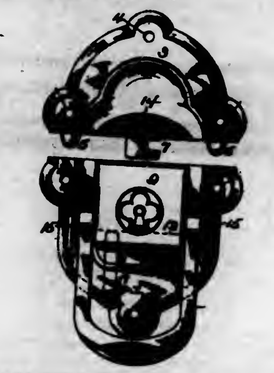
3. A coil-spring connection device, consisting of a single piece of wire formed into two overlapping looped straining or tension elements, and a coiled compression-spring encircling the overlapping portions of the tension elements and held between the inner ends thereof.

810,147. TRUNK-LOCK. JOSEPH A. HOUSE, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, Stamford, Conn. Filed Feb. 28, 1905. Serial No. 247,788.

Claim.—1. In a combined hasp and lock, the combination with a member having a lock thereon, and side walls or bearings on opposite sides of the lock, and a hasp pivotally supported by the lock-case, and supported laterally by said side walls, of a member having a dowel to enter the lock and be engaged by the locking mechanism of the latter, and provided with a keeper to be engaged by the hasp.

2. In a combined hasp and lock, the combination with a member carrying a lock and hasp, and having walls forming lateral supports for the hasp when the latter is closed, of a second member having a dowel to enter the lock-casing and be engaged by the locking mechanism of the latter, and a keeper to be engaged by the hasp.

3. In a combined hasp and lock the combination with a member carrying a lock and a pivoted hasp, and provided with a recessed seat for the latter, of a second member having a dowel to enter the lock-casing and be engaged by the locking mechanism of the latter, and a keeper to be engaged by the hasp.



4. In a combined hasp and lock the combination with a member having a lock and a hasp, of a second member having a dowel to enter the lock and be engaged by the locking mechanism of the latter, side dowels entering seats in said first-mentioned member, and a keeper to be engaged by the hasp.

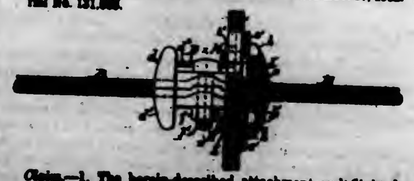
5. In a combined hasp and lock, the combination with a member having a lock thereon, and a hasp operating independently of the lock and pivotally supported by said member, of a second member having a dowel to enter the lock and be engaged by the locking mechanism of the latter, and provided with a keeper to be engaged by the hasp.

810,148. TOY OR EDUCATIONAL DEVICE. FRANK HORNBY, Liverpool, England. Filed July 23, 1901. Serial No. 69,311.

Claim.—1. In combination with a shaft having a groove extending longitudinally thereof; a member mounted upon said shaft and likewise provided with a groove upon its inner face; and an interlocking device formed of a piece of thin metal, said piece being bent or formed with a portion to embrace the shaft and with a laterally-projecting tongue, said tongue passing into the grooves and locking the shaft and member together, while the embracing portion remains without the member, substantially as described.

2. In combination with a shaft having a groove extending longitudinally thereof; a disk provided with a central opening and with a groove extending longitudinally of said opening, said disk being likewise provided with a groove *e* extending around the same and with a flanged tread *f*; and an interlocking device formed of a piece of thin metal, said piece being bent or formed with a portion to embrace the shaft and with a laterally-projecting tongue, said tongue passing into the grooves and locking the shaft and disk together, while the embracing portion remains without said member, substantially as described.

810,149. CONVEYER. GEORGE C. HENRY, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Nov. 17, 1902. Serial No. 131,668.



Claim.—1. The herein-described attachment and flight for a conveyer, it having the clamp or attachment formed in halves adapted to be clamped together and to form a bond of the cable therein, in combination with a detachable scraper or flight, and detachable means for securing the scraper or flight to the attachment, and means independent of the fastening devices for locking the flight against rotation on the attachment, substantially as set forth.

2. The herein-described attachment and flight for a conveyer, it having two separable halves adapted to be clamped to a cable or chain, said halves being formed with the curved-surfaced hub B at the rear end and the disk *d'* in combination with the detachable flight C formed in sections and adapted to be placed around the two parts of the attachment, and means for clamping the flight to the disk *d'* independently of the cable, substantially as set forth.

3. The herein-described attachment and flight for a conveyer, it comprising the clamp D formed in two halves adapted to be clamped to the cable or chain and having the flange *d'* arranged between the ends of the clamp and the two-part flight adapted to be placed around said clamp and to be detachably secured to said flange thereon, substantially as set forth.

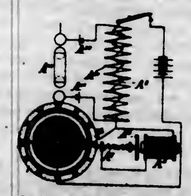
4. The herein-described attachment and flight for a conveyer, it comprising the clamp or attachment formed in halves and adapted to be clamped to the cable or chain, said halves being formed with a flange *c'* and the rear hub part B, the flight formed in sections and adapted to be placed around the attachment and the bolts for detachably securing said flight to the flange *c'*, the hub part B being so shaped as to engage with the heads of the bolts and prevent them from turning when the flight is secured in place, substantially as set forth.

5. In a flight-conveyer, the combination of a two-part attachment adapted to be clamped to the cable or chain said halves being formed with a flange *c'* and one of them having a rib *d'*, and the two-part flight, fitted around said attachment and secured to said flange and having a recess adapted to receive said rib and to lock the flight against rotation independently of its fastening devices, substantially as set forth.

6. The herein-described attachment and flight for a conveyer, it comprising the clamp D formed of two halves adapted to be clamped to the cable or chain and having the enlarged convexly-curved ends for engaging with the teeth of a sprocket-wheel and the flange arranged between said ends, and the flight placed around said clamp and secured to the said flange, substantially as set forth.

7. In a cable conveyer the combination with the flexible cable, and a detachable laterally-extending circular flight or scraper surrounding said cable, of the attachment-clamp formed in two parts separable on a line longitudinally of the cable and detachably connected to the flight or scraper, the clamp having a convexly-faced enlargement or head at one side of the flight or scraper and one on the other side and both adapted to engage with the teeth of a sprocket-wheel irrespective of the axial position of the flight and adapted to relieve the flight or scraper of strains or pressure from the wheel, substantially as set forth.

810,150. WIRELESS TRANSMITTING AND RECEIVING MECHANISM FOR ELECTRIC WAVES. CHRISTIAN HÜLSMEYER, Düsseldorf, Germany. Filed Mar. 14, 1904. Serial No. 198,975.



Claim.—1. In a device of the kind described the combination with an electric-wave transmitter, of an electric-wave receiver, each having synchronously-rotating contact-wheels, for automatically freeing the contact-wheels, means for actuating the receiver mechanism, after a predetermined space of time, means for preventing all other waves arriving at other moments actuating the receiver mechanism, and means for regulating the resistance of the coherer to a determined point, by varying the angle of the coherer, substantially as and for the purpose described.

2. In an electric-wave transmitter, the combination with the primary circuit of the inductorium and a manipulating-key, of an electromagnet inserted in the said circuit and actuating a spring stop-lever, a contact-wheel inserted in the said primary circuit, a stop-lug integral with the contact-wheel and in electrical contact with the said spring-lever when at rest, and completing the primary circuit, a contact-piece contact-piece on a contact-ring surrounding the contact-wheel and connected to the primary circuit, which it completes through the contact-wheel, when the lug of the latter, during the rotating touches the contact-piece of the contact-ring, and means for varying the moment at which the primary circuit is closed during the rotation of the contact-wheel, substantially as and for the purpose described.

3. In an electric-wave transmitter, the combination with the primary circuit of the inductorium and a manipulating-key of an electromagnet, inserted in the said circuit and actuating a spring stop-lever, a contact-wheel inserted in the said primary circuit, a stop-lug integral with the contact-wheel and in electrical contact with the said spring-lever when at rest, and completing the primary circuit, a contact-piece slidable and fixable in circular groove of a contact-ring, surrounding the contact-wheel and connected to the primary circuit, which it completes through the contact-wheel when the lug of the latter during its rotation, touches the contact-piece, the contact-ring being provided with a time-scale, substantially as and for the purpose described.

4. In an electric-wave receiver, the combination with a coherer-circuit of an electromagnet inserted in the coherer-circuit and acting upon a stop-armature, a contact-wheel rotating synchronously with the contact-wheel of the transmitter, and inserted in the coherer-circuit, by means of a stop-lug in contact with the said stop-armature when the contact-wheel is at rest, a movable contact disposed at a place corresponding to that of the contact-piece of the transmitter, and completing the circuit of the receiving apparatus, when the lug of the contact-wheel touches it during the rotation of the wheel, and means for removing the said contact out of the way of the said contact-lug when electric waves arrive at other moments than those corresponding to the closing of the contacts of the transmitter and receiver, substantially as and for the purpose described.

5. In an electric-wave receiver, the combination with a coherer-circuit of an electromagnet inserted in the coherer-circuit and acting upon a stop-armature, a contact-wheel rotating synchronously with the contact-wheel of the transmitter, and inserted in the coherer-circuit by means of the stop-lug in contact with the said stop-armature when the contact-wheel is at rest, a movable contact disposed at a place corresponding to that of the contact-piece of the transmitter and completing the circuit of the receiving apparatus, when the lug of the contact-wheel touches it during the rotation of the wheel, and electrically-connected contact-pieces surrounding the contact-wheel and completing by means of this contact-wheel and its contact-lug, the circuit of an electromagnet, inserted in the coherer-circuit, when electric waves arrive at other moments than those provided for by the adjustment of the apparatus, the said electromagnet by its armature withdrawing the movable contact from the way of the lug of the contact, and a lever, operated by the contact-lug, when the latter has passed the movable contact, substantially as and for the purpose described.

6. In a coherer for electric-wave receivers of the kind described, the combination with a glass vacuum-tube of a fixed piston, a movable piston, a body of coherer-powder located between the pistons, a suspension-spring for the movable piston within the tube, and means for inclining the glass tube to different angles so as to vary the pressure of the movable piston upon the body of coherer-powder, substantially as and for the purpose described.

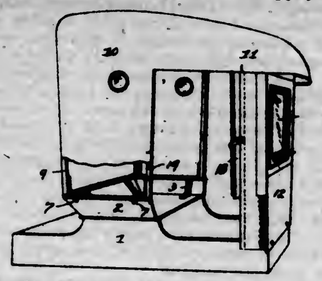
7. In a coherer for electric-wave receivers of the kind described, the combination with a glass vacuum-tube, of a fixed piston and a movable piston containing between them a body of coherer-powder, a suspension-spring for the movable piston, a balancing support-plate, a lever system inclining more or less the said balancing support-plate, a solenoid-armature connected to the said lever system, and a counterweight also connected to the said lever system and counteracting the action of the said solenoid inserted in the circuit of the coherer, substantially as and for the purpose described.

8. In a receiver for wireless electric apparatus comprising a metallic casing, insulating-plates lodged in the recessed side walls of the casing, receiving-wires embedded in the insulating-plates and connected together at the entry-point of the casing, and a base-plate connected to the other end of the coherer and serving as earth-conductors, substantially as and for the purpose described.

810,151. STORM-TOP. WILLIAM A. HUSTIS, Terre Haute, Ind. Filed Mar. 30, 1905. Serial No. 253,262.

Claim.—1. The combination with a vehicle-body having a seat portion, of a rail of substantially the same shape as the edge of the seat portion, lugs on said seat portion downwardly-extending projections on the rail detachably engaging with said lugs upwardly-

extending projections on said rail and a rigid storm-top frame having vertical members bolted to said upwardly-extending projections.

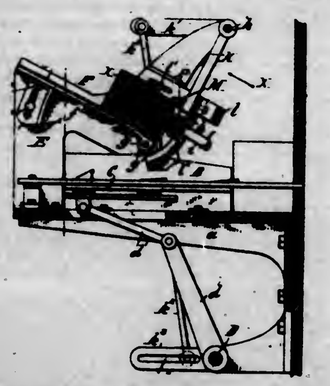


2. The combination with a vehicle-body having a seat portion, a rail of substantially the same shape as the edge of the seat portion, means for detachably securing the rail to the seat portion, a storm-top having its rear portion secured to said rail and having a depending front portion, bolts connecting the bottom part of said depending portion to the front of the vehicle-body, vertical rollers carried by said depending portion, said rollers being under spring tension and side curtains carried by said rollers.

3. The combination with a vehicle-body, of a storm-top and front carried thereby, spring-actuated side curtains for the sides of said top and a strip carried at the edge of each curtain interlocking with a part carried by the storm-top, substantially as described.

4. The combination with a vehicle-body, of a storm-top and front carried thereby, spring-actuated side curtains for the sides of said top, and a V-shaped strip carried at the edge of each curtain designed to receive the correspondingly-shaped frame member, substantially as described.

810,152. FEED MECHANISM FOR METAL SHEETS. OLIVER J. JOHNSON, Wheeling, W. Va. Filed Jan. 27, 1904. Serial No. 190,816.



Claim.—1. The combination of a holder in which the blanks stand on edge, a stationary chute arranged in front of said holder and inclining downwardly toward the latter, a feed-arm arranged between said blank-holder and said chute and hung from above to swing back and forth between the holder and the chute, a feed device on said arm which is pressed against the faces of the blanks and to which the blanks adhere, and means for oscillating said feed-arm, whereby the blanks are removed from said holder and delivered to said chute with their front faces down, substantially as set forth.

2. The combination of an inclined holder in which the blanks stand on edge in an inclined position, a chute arranged in front of said holder and inclining in substantially the same direction as the blanks in the holder, a pivoted feed-arm arranged between said blank-holder and said chute, a feed device on said arm for holding the blanks, and means for oscillating said feed-arm, whereby the blanks are removed from said holder and delivered to said chute with their front faces down, said chute serving to strip the blanks from said feed device, substantially as set forth.

3. The combination of a holder for supporting a pile of blanks on edge, retaining-lips which engage the sides of the foremost blank to retain the blanks in the holder, an oscillating feed device for removing the blanks separately from said holder, and a stationary restraining device past which the blank secured to the feed device is carried by the latter and which bears against the edges only of the blanks to prevent the removal of more than one blank at a time from the holder, substantially as set forth.

4. The combination of a holder for supporting a pile of blanks on edge, a feed device for removing the blanks separately from said holder, and a stationary restraining device past which the blank secured to the feed device is carried and which occupies across the edge of the blank carried by the feed device to hold back succeeding blanks and prevent the removal of more than one blank at a time from the holder, substantially as set forth.

5. The combination of a holder for supporting a pile of blanks on edge, a feed device for removing the blanks separately from said holder, and a stationary restraining device past which the blank secured to the feed device is carried by the latter and which bears against the edges only of succeeding blanks to prevent the removal of more than one blank at a time from the holder, substantially as set forth.

6. The combination of a holder for supporting a pile of blanks on edge, a feed device for removing the blanks separately from said holder, and a yielding restraining-finger past which the blank secured to the feed device is carried by the latter and which bears against the edges only of succeeding blanks to prevent the removal of more than one blank at a time from the holder, substantially as set forth.

7. The combination of a holder for supporting a pile of blanks on edge, an oscillating feed device for removing the blanks separately from said holder, and a yielding restraining-finger past which the blank secured to the feed device is carried by the latter and which bears against the top edges only of succeeding blanks to prevent the removal of more than one blank at a time from the holder, substantially as set forth.

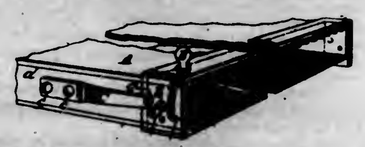
8. The combination of a holder for supporting a pile of blanks on edge, retaining-lips which engage the sides of the foremost blank to retain the blanks in the holder, an oscillating feed device for removing the blanks separately from said holder, and a yielding restraining device past which the blank secured to the feed device is carried by the latter and which bears against the step edges of the succeeding blanks to prevent the removal of more than one blank at a time from the holder, substantially as set forth.

9. The combination of a holder for supporting a pile of blanks on edge, an oscillating feed device for removing the blanks from said holder, an inclined chute to which the blanks are carried by said feed device, and a spring propelling device arranged above the path of the blanks, and which is engaged and deflected by the blank carried by the feed device and which throws the blank quickly down the chute when released from said feed device, substantially as set forth.

10. The combination of a frame, a horizontal supporting-rod, a blank-holder comprising bars mounted for vertical swinging and lateral adjustment on said supporting-rod, and brackets vertically adjustable on said frame, and on which said blank-holder bars are laterally adjustable, substantially as set forth.

11. The combination of a frame, a blank-holder supported thereby, a yoke having arms adjustably secured to said frame, a blank-chute secured to said adjustable yoke in front of said blank-holder, and a feed device arranged between said blank-holder and chute for carrying the blanks from the former to the latter, substantially as set forth.

810,153. LINOTYPE-MACHINE. DAVID S. KENNEDY, Brooklyn, N. Y., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Feb. 3, 1898. Serial No. 668,903.



Claim.—1. The channeled linotype-magazine, in combination with the plate, B, adapted to cover and close the end of the magazine, said plate united to the magazine by sliding and turning end connections, substantially as shown, adapted to confine the plate against the end and also to permit it to lie closely upon the outside of the magazine when open.

2. In combination of a linotype-magazine with a cover-plate having angular ends, each end connected with the edge of the magazine by two slots and studs constructed substantially as shown, to permit the cover to be closed tightly over the end of the magazine or to be opened flatly against its side face.

3. In combination with the channeled magazine, the closing-plate having angular ends extended along the edges of the magazine and connected thereto by studs, substantially as shown, whereby the plate is adapted to fold against the outer surface of the magazine, and also adapted to close its end and to resist the escape of the matrices.

4. A linotype-magazine in combination with a cover-plate having angular ends, studs and slots connecting said parts, and a spring-catch to hold the cover in operative position.

810,154. COMBINED WEEDER AND HARROW. THOMAS J. KING, Richmond, Va. Filed Oct. 17, 1905. Serial No. 283,182.

Claim.—1. In a harrow, the combination of a harrow-frame, an oscillatory frame disposed longitudinally of the harrow-frame and fulcrumed at an intermediate point, harrow-teeth carried by the rear portion of the oscillatory frame, and an operating-bar connected with the oscillatory frame in advance and in rear of the pivotal point thereof for raising and lowering the harrow-teeth.

2. In a harrow, the combination of a harrow-frame, an oscillatory frame provided with a pair of levers disposed longitudinally of the harrow-frame and pivoted to the same at an intermediate point, a tooth-carrying bar connecting the rear portions of the levers, and a longitudinally-disposed operating-bar arranged at an inclination and connected with the front portions of the levers and with the tooth-carrying bar.

3. In a harrow, the combination of a harrow-frame, an oscillatory frame provided with longitudinal levers, and a front cross-bar connecting the levers, the latter being pivoted at an intermediate point, a tooth-carrying bar connecting the rear ends of the levers, an inclined operating-bar secured at its front end to the said cross-bar, and means for connecting the rear portion of the operating-bar with the tooth-carrying bar.

4. In a harrow, the combination of a harrow-frame provided with runners, an oscillatory frame having a front cross-bar and provided with side levers fulcrumed at an intermediate point on the sides of the harrow-frame, an inclined operating-bar disposed longitudinally of the harrow and secured at its front end to the said cross-bar, inclined rods or bars connecting the rear portion of the operating-bar with the tooth-carrying bar, and a pivoted supporting-bar mounted on the harrow-frame and arranged to engage the inclined bar for holding the latter in an elevated position.

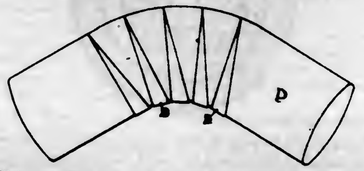
5. In a harrow, the combination of a harrow-frame, an oscillatory tooth-carrying frame, and a foot mounted on the oscillatory frame and arranged to support the harrow to permit the same to be readily turned at the end of a row.

6. In a harrow, the combination of a harrow-frame, an oscillatory frame fulcrumed at an intermediate point, harrow-teeth carried by the rear portion of the frame, and a foot arranged on the front portion of the frame for supporting a harrow to permit the same to be turned at the end of a row.

7. In a harrow, the combination of a harrow-frame, an oscillatory frame fulcrumed at an intermediate point and provided at the back with harrow-teeth, a pivotally-mounted foot carried by the front portion of the oscillatory frame, and operating means connected with the oscillatory frame.

8. In a harrow, the combination of a harrow-frame, an oscillatory frame fulcrumed at an intermediate point and provided at the back with harrow-teeth, a pivotally-mounted foot carried by the front portion of the oscillatory frame, and an operating-lever connected with the oscillatory frame.

810,155. PROCESS FOR THE MANUFACTURE OF SHEET-METAL ELBOWS. WILLIAM H. KLAMER, Dubuque, Iowa. Filed Feb. 1, 1905. Serial No. 243,044.



Claim.—1. The process of manufacturing sheet-metal elbows which consists of first forming flat plaits in a sheet-metal blank, forming the blank thus plaited into a tube, and then drawing out certain portions of the flat plaits to form the curve of the elbow leaving the undrawn-out portions of the plaits flat when the elbow is finished.

2. The process of making sheet-metal elbows which consists in cutting out a rectangular blank from the sheet of metal, plaiting or folding the blank crosswise with each plait of uniform width throughout its length, bending the plaited blank into a tube and then drawing out the plaits at such portions as desired to form the curve of the elbow and leaving the folds of the plaits flat and in contact with each other, the one outside and the other inside of the central sheet of the plait.

3. The process of manufacturing sheet-metal elbows, which consists of cutting out the blank, then forming flat plaits or folds crosswise of the blank, turning the blank into a tube with the plaits therein, and then drawing out part of the plaits at certain portions of the plaits and other plaits at different portions to form different elbows in the same tube.

4. The process of manufacturing sheet-metal elbows, which consists in cutting out a blank, plaiting the blank with flat plaits of threefold thickness or sheets, forming the blank into a tube with one thickness or sheet of the metal upon the outside and one upon the inside of the central sheet of the plait, then partially drawing out certain portions of the plaits to form the curve of the elbow.

5. The process of manufacturing corrugated sheet-metal elbows, which consists in cutting out a blank, forming threefold flat plaits therein, forming the plaited blank into a corrugated tube, and then drawing out certain portions of the flat plaits to form the curve of the elbow.

810,156. GUN-SIGHT. JOHN KLEINSCHMIDT, Kipling, Mich. Filed Jan. 9, 1905. Serial No. 240,266.

Claim.—1. In combination with a gun embodying a movable breech-block, a sight therefor comprising an attaching-plate secured to the rear end of the breech-block, a plate swivelly connected with the attaching-plate aforesaid, and a sight member adjustable upon the swiveled plate.

2. A sight comprising an attaching-plate adapted to be secured

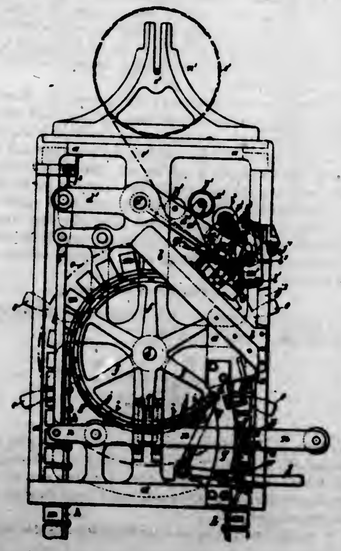
to a gun, a plate swiveled to the attaching-plate, spaced lugs projected from the last-mentioned plate, an exteriorly-threaded sight-pin mounted in said spaced lugs and provided with a peep at one end, a nut arranged between the lugs and mounted upon the sight-pin for adjustment thereof, the sight-pin being longitudinally grooved, and a screw threaded into one of the lugs aforesaid and having one end thereof projected into the groove of the sight-pin so as to prevent rotation of the same on adjustment thereof.

3. A sight for guns comprising an attaching-plate, a plate swiveled to said attaching-plate, and a sight member adjustable upon the last-mentioned plate, the swiveled plate admitting of lateral adjustment of the sight as set forth.

810,157. SELF-LUBRICATING TROLLEY-WHEEL. ARTHUR R. KRAMER and OSCAR P. DUFF, Uniontown, Pa. Filed June 17, 1905. Serial No. 265,706.

Claim.—A cast wheel having a tubular hub, an integral oil-chamber between the hub and the rim of the wheel, an integral web within the chamber and extending between the inner and outer ends thereof, said web having a longitudinal passage closed at its outer end and extending through the hub into communication with the interior thereof, there being a lateral entrance-opening piercing the web into communication with the passage, one side of the chamber being provided with an opening adjacent the entrance-opening of the passage of the web, said opening serving for the removal of the core from the chamber, to permit filling of the chamber and to give access to the entrance-opening for removing obstructions therefrom, and a removable closure for the opening.

810,158. MACHINE FOR PRODUCING PRINTED RAILWAY-TICKETS. GABRIEL LAPOZE, Paris, France. Filed Apr. 12, 1901. Serial No. 55,302.



Claim.—1. A machine of the character described, comprising in combination a supporting-frame, a printing-table, two dies fixed parallel to each other on said table, an endless chain carrying a series of printing-blocks suitable for different stations arranged side by side and in two parallel series, which blocks when placed in the proper position relatively to the fixed dies compose the complete text of the ticket, a notched drum over which the said chain passes, means for turning the drum, two operating-levers, two printing-beams, means intermediate the said levers and the beams, whereby the latter may be operated by said levers, mechanism operated by the said beams for advancing strips of card the length of the width of a ticket in order that they may receive the impression from the fixed dies and block temporarily opposite to them, cutting devices and means intermediate said cutting devices and the beams whereby the tickets are cut off in the manner and for the purpose specified.

2. A machine of the character described, comprising in combination a supporting-frame, a printing-table, two dies fixed parallel to each other on said table, an endless chain carrying a series of printing-blocks suitable for different stations, arranged side by side in two parallel series, which blocks when placed in the proper position relatively to the fixed dies compose the complete text of the ticket, a notched drum over which the chain passes, means for turning the drum, two operating-levers, two printing-beams, means intermediate the levers and beams, whereby the latter may be operated by said levers, mechanism operated by said beams for advancing strips of card the length of the width of a ticket, cutting devices, means intermediate said cutting devices and the beams whereby the tickets are cut off, inking devices and means intermediate the beams and said inking devices whereby the latter will ink the blocks and dies after each cutting operation.

3. A machine of the character described, comprising in combination a supporting-frame, a printing-table, two dies fixed parallel to each other on said table, an endless chain carrying a series of printing-blocks suitable for different stations arranged side by side in two parallel series, a notched drum over which the chain passes, means for turning the drum, two operating-levers, two printing-beams, means intermediate the levers and beams, whereby the latter may be operated by the levers, two parallel ratchet-plates having their teeth reversed, said plates being secured to the supporting-frame and printing-table, as described, pawls on the operating-levers adapted to engage with the teeth of the ratchet-plate, as described, and stops arranged at both ends of the ratchet-plates and adapted to operate on the pawls in the manner set forth.

4. A machine of the character described, comprising in combination a supporting-frame, a printing-table, a die on said table, an endless chain carrying a series of printing-blocks, a notched drum over which the chain passes, means for turning the drum, an operating-lever, a printing-beam, means intermediate the lever and beam whereby the latter may be operated by the lever, mechanism operated by said beam for advancing a strip of card, cutting devices, and means intermediate said cutting devices and the beam whereby the tickets are cut off in the manner specified.

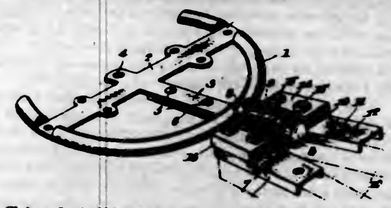
5. The combination of two fixed dies or blocks, a chain of blocks, means for operating the latter, two printing-beams, operating-levers, mechanism intermediate the latter and the beams, whereby the beams may be operated, and mechanisms operated by the beams to feed and cut a card strip and feed a record-strip in the manner and for the purpose set forth.

810,159. METHOD OF MANUFACTURING ARTIFICIAL TAILS FROM FUR. SIMON LEWIN, Schöneberg, near Berlin, and ADOLF BLUMENTHAL, Berlin, Germany. Filed June 21, 1905. Serial No. 266,268.

Claim.—1. The method of manufacturing artificial tails from fur consisting in removing the hide or skin from the hairs, connecting the latter with each other by a cementing medium so as to turn them into feathers and winding the thus produced feathers around a cord so as thereby to obtain the artificial tail desired, substantially as described.

2. The method of manufacturing artificial tails from fur consisting in removing the hide or skin from the hairs of two kinds of fur, connecting the hairs of each kind separately by means of a cementing medium, so as to turn them into feathers and winding the thus produced feathers alternately around a cord, in such a manner that a feather of one kind is located between two feathers of the other kind, substantially and for the purpose as described.

810,160. RUNNING-GEAR. FRANK D. LEMMENTHEIER, Patrick, Wyo. Filed July 19, 1905. Serial No. 270,419.



Claim.—1. A fifth-wheel having a cross-bar and a longitudinally-disposed radial bar, the latter being perforated at its forward extremity for the passage of a draw-bolt, in combination with a spindle member extending rearwardly from and in alinement with the radial bar and provided with a plurality of collars, two of said collars being disposed at the ends of the spindle member and one intermediate between the ends; a boxing for said spindle abutting upon the terminal collars and annularly grooved for engagement with the intermediate collar; and a reach member connected with said boxing.

2. A fifth-wheel having a cross-bar and a longitudinally-disposed radial bar, the latter being perforated at its forward extremity for the passage of a draw-bolt; in combination with a bar bolted upon the radial bar and having a rearwardly-extending spindle member provided with a plurality of collars; a boxing engaging said spindle member; and a reach member connected with said boxing.

810,161. CARTRIDGE-CLIP. ORESTES M. LEREAK, Westpoint, N. Y. Filed Feb. 11, 1905. Serial No. 245,199.

Claim.—1. A cartridge-clip, comprising a body and inserted spring and a flexible tongue projecting at each end thereof adapted to be bent into a groove in the cartridge-head.

2. In combination, a cartridge-clip, comprising a body and inserted spring, and a flexible tongue projecting at each end thereof, a plurality of cartridges, having grooved heads, in said clip, the tongues being bent into a groove in the head of the cartridge.

3. A cartridge-clip comprising a body and inserted spring, a tongue, projecting from each end of said spring, adapted to be bent into a groove in the cartridge-head.

4. A cartridge-clip comprising a body and inserted spring, and a tongue of flexible material, projecting from each end of said spring, adapted to be bent into a groove in the cartridge-head.

5. A cartridge-clip comprising a body and a soft-metal inserted spring, and a tongue of flexible material, projecting from each end of the spring, adapted to be bent into a groove in the cartridge-head.

6. A cartridge-clip comprising a body and inserted spring, the end of the body and spring being rounded.

7. A cartridge-clip comprising a body and inserted spring, the ends of the body being rounded, and a projecting tongue of flexible material at each end of the clip.

8. A cartridge-clip comprising a body and inserted spring, the ends of the spring being rounded, and a projecting tongue of flexible material at each end of the spring.

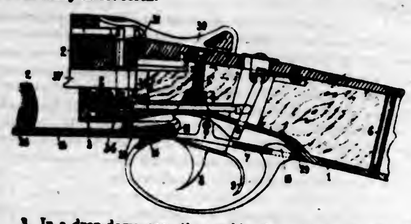
9. A cartridge-clip comprising a body and inserted spring, the end of the body and spring being rounded, and a projecting tongue of flexible material at each end of the clip.

10. In combination, a clip having a body portion and inserted spring and projecting tongues, of a plurality of cartridges having grooved heads inserted therein, each tongue being bent into the groove of the cartridge-head adjacent thereto.

810,162. HAMMERLESS DROP-DOWN GUN. CARL LOSSE, Liège, Belgium. Filed Apr. 1, 1905. Serial No. 253,570.

Claim.—1. In a drop-down gun, the combination with the breech and the stock, of a stock-connecting piece, removably secured to said breech and stock, a trigger and breech cover-plate made of a single piece, a trigger-guard, means for removably attaching the latter to said trigger-plate, vertically-projecting plates on said cover-plate, pivot-pins on said vertically-projecting plates for the reception of the several lock parts, and means for locking the barrels on the breech, substantially as set forth.

2. In a drop-down gun, the combination with the breech and the stock, of a stock-connecting piece removably secured to said breech and stock, a suitable recess provided in said stock-connecting piece, a trigger-plate arranged within the recess of said stock-connecting piece together with the triggers, sears and springs, a trigger-guard removably attached to said trigger-plate, a breech-covering plate made of a single piece with the trigger-plate, upwardly-extending projections on said cover-plate and made one with the latter, pivot-pins on said projections for the reception of the several lock parts, and means for locking the barrels of the gun on the breech, substantially as set forth.

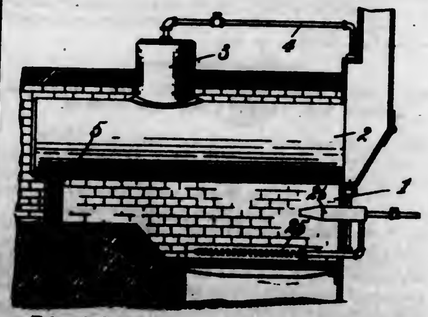


3. In a drop-down gun, the combination with the breech and the stock, a connecting-piece between the same, and a suitable recess in said connecting-piece, of a trigger and breech cover-plate made of a single piece, said trigger and breech cover-plate carrying the several parts of the lock housed partially within the recessed stock-connecting piece and partially within the forward end of the breech, substantially as set forth.

4. In a drop-down gun, the combination with the breech and stock, a suitably-shaped connecting-piece between the same, a trigger and breech cover-plate made of a single piece and carrying all the parts of the gun-locks; of the thumb-lever of the locking system, the downwardly-projecting pivot-pin of the same, an upper projection on the thumb-lever, engaging the upper locking-bolt, a lower projection engaging the lower locking-bolt arranged over the barrel-fastening, a rearward extension on the latter engaged by said lower locking-bolt, and means for preventing the lateral movements of the barrels in any case, substantially as set forth.

5. In a drop-down gun, the combination with the breech and stock, a suitably-shaped connecting-piece between the same, a trigger and breech cover-plate made of a single piece and carrying all the parts of the gun-locks; of the thumb-lever of the locking system, the downwardly-projecting pivot-pin of the same, an upper projection on the thumb-lever, engaging the upper locking-bolt, a lower projection engaging the lower locking-bolt arranged over the barrel-fastening, a rearward extension on the latter engaged by said lower locking-bolt, rearward extensions on both sides of the barrels, and corresponding recesses, on the sides of the breech, adapted to be engaged by said extensions when the gun is in the locked position, substantially as set forth.

810,163. APPARATUS FOR PRODUCING PERFECT COMBUSTION IN FURNACES. HARRY LOCKENBACH, San Francisco, Cal., assignor to William H. Kelly, San Francisco, Cal. Filed Dec. 8, 1904. Serial No. 236,668.

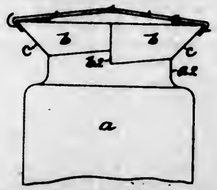


Claim.—1. In an apparatus of the character described, the combination with a furnace, and an oil-burner arranged to direct the flames into said furnace, of a coil of pipe, a pipe for supplying steam

to said coil, and a pipe for supplying steam from said coil to the burner, of a cast-iron casing for said coil formed in two sections one of said sections having a tortuous channel to receive said coil, corresponding in general form and dimensions with said coil, but sufficiently larger than the coil to permit the latter to expand freely therein, when subjected to a high degree of heat, said casing being placed in proximity to, but to one side of, and out of direct contact with, the flames from the burner, the whole of the coil of pipe between the entrance of the supply-pipe and the egress of the pipe to the burner being inclosed within said casing, substantially as described.

2. In an apparatus of the character described, the combination with a furnace, and an oil-burner arranged to direct the flames into said furnace, of a coil of pipe, a pipe for supplying steam to said coil, and a pipe for supplying steam from said coil to the burner, of a cast-iron casing for said coil formed in two sections each of said sections having a tortuous channel to receive said coil, corresponding in general form and dimensions with said coil, but sufficiently larger than the coil to permit the latter to expand freely therein, when subjected to a high degree of heat, said casing being placed in proximity to, but to each side of, and out of direct contact with, the flames from the burner, the whole of the coil of pipe between the entrance of the supply-pipe and the egress of the pipe to the burner being inclosed within said casing, substantially as described.

810,164. CLOSURE DEVICE FOR BOTTLES, JARS, AND SIMILAR VESSELS. EDWARD A. MATTHIAS, Liverpool, England. Filed Dec. 27, 1904. Serial No. 238,415.



Claim.—A jar or similar vessel provided with a neck the top portion of which is inclined outwardly both inside and outside and provided at the bottom of the incline on the inner side with an annular shoulder and at the top of the incline on the outer side with segmental flanges or ribs on the opposite sides of the neck, the transverse width of which increases from one end thereof to the other and in opposite directions; and closure devices consisting of a packing-ring placed on said annular shoulder, a cap the perimeter of which is inclined inwardly and downwardly and provided at the bottom of the inclination with an annular recess adapted to receive said packing-ring, the diameter of the cap at the top and of the inwardly-inclined portion of the neck being such as to form a narrow annular space between the said cap and neck when the cap is in position, and a locking plate or strip placed transversely of the cap and adapted to turn thereon, said plate or strip being provided at its opposite ends with inwardly and downwardly directed tongues or projections adapted to engage the flanges or ribs at the top of the neck, and adjacent to the ends with downwardly and inwardly directed tongues or projections adapted to engage the edges of the cap and to enter the annular space between the cap and the top portion of the neck, substantially as shown and described.

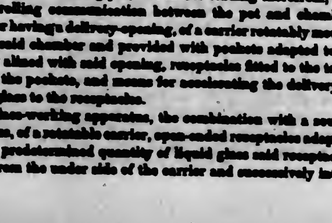
810,165. SELF-DUMPING SCRAPER. JOHN F. MEDDERSALL, Springville, Utah. Filed Nov. 8, 1905. Serial No. 286,266.

Claim.—1. In a self-dumping scraper, the combination with a scraper-pan or scoop, of a dump-bar having a portion journaled to the pan and substantially straight arms extending forwardly at the sides of the pan which are provided with free ends to engage the ground, and a latch adapted to engage the dump-bar to hold the forwardly-extending arms raised and in substantially horizontal position, together with means for releasing said latch.

2. In a self-dumping scraper, the combination with a scraper-pan or scoop, of a dump-bar of substantially U shape having a crosspiece journaled to the back of the scraper-pan or scoop and substantially straight arms extending forwardly at the sides of the pan or scoop which are provided with free ends to engage the ground, a latch on the side of the pan or scoop adapted to engage one of said arms and hold the forwardly-extending arms raised and in substantially horizontal position, and means for releasing said latch.

3. In a self-dumping scraper, the combination with a scraper-pan or scoop, of a dump-bar having a portion journaled to the pan and arms extending forwardly at the sides of the pan which are provided with free ends to engage the ground, a spring latch-bar secured to the side of the pan and extending in a general up-and-down direction having a free portion provided with a latching-head adapted to engage and support the arm of the dump-bar, and means for releasing said latch-bar.

810,166. IRONING-BOARD. DANIEL NIMMER, Rochester, N. Y., assignor of one-half to George McElhatry, Rochester, N. Y. Filed May 5, 1904. Serial No. 206,606.



Claim.—1. The combination of a main ironing-board; a supplemental bosom and sleeve board; a U-shaped bracket having parallel sides, one above the other, one of which sides is adapted to lie upon the main board and the other to support the supplemental board; means for pivotally attaching the bracket to the main board near one of its ends, with the open end of the bracket directed toward said end of the main board, whereby said bracket is adapted to straddle the edge of said board; and means for pivotally attaching said supplemental board upon said bracket; substantially as shown and described.

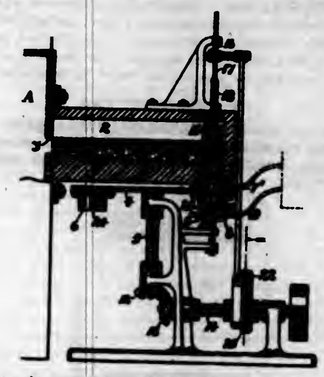
2. The combination of a main ironing-board; a supplemental bosom and sleeve board; a bracket comprising two U-shaped members rigidly connected together, each having two corresponding parallel sides, one above the other, which are, respectively, adapted to lie upon the main board and to support the supplemental board; means for pivotally attaching the bracket to the main board near one of its ends, with the open end of the bracket directed toward said end of said main board, whereby said bracket is adapted to straddle the edge of said board; and means for pivotally attaching said supplemental board upon said bracket; substantially as shown and described.

3. The combination of a main ironing-board; a supplemental bosom and sleeve board; a bracket comprising the arms 9, 9 adapted to lie upon the main board, the connecting part 8 between said arms, adapted to act as a bearing for the bracket, the upright stems 10, 10, the arms 11, 11 above and parallel with the arms 9, 9, respectively, and adapted to support said supplemental board, and a bearing between said arms 11 11; means for attaching the bracket to the main board by the connecting part 8 whereby said bracket is adapted to turn over the edge of said board; and means for pivotally attaching said supplemental board to said bearing; substantially as shown and described.

810,167. MACHINE FOR AUTOMATICALLY SEGREGATING, MEASURING, AND DELIVERING MOLTEN GLASS. WALKER D. HOMMEDIEU, San Francisco, Cal. Filed Feb. 16, 1901. Serial No. 183,773.

Claim.—1. In a glass measuring and delivering apparatus, the combination with a melting-pot, a chamber leading therefrom, and means controlling communication between the pot and chamber, said chamber having a delivery-opening, of a carrier rotatably mounted beneath said chamber and provided with pockets adapted to be successively aligned with said opening, receptacles fitted to the table in line with the pockets, and means for accelerating the delivery of the molten glass to the receptacles.

2. In glass-working apparatus, the combination with a source of liquid glass, of a rotatable carrier, open-ended receptacles adapted to contain a predetermined quantity of liquid glass said receptacles depending from the under side of the carrier and successively interposed in the course of liquid-supply, and a closure for the bottom of said receptacles, said closure yieldingly supported independent of the carrier.



3. In a glass measuring and delivering apparatus, the combination with a source of liquid-glass supply of a perforated rotary table, means for giving said table a step-by-step movement and open-ended measuring-receptacles removably secured to, and depending from, the under side of said table in line with the perforations therein and interposable in the path of the liquid, and a depressible bottom closure supported independent of the table for said receptacles.

4. In a glass measuring and delivering apparatus, the combination with a source of liquid-glass supply having a delivery-aperture, of a rotary carrier, means for giving said carrier a step-by-step movement, open-ended measuring-receptacles depending from the under side of the carrier and aligned with pockets therein, said receptacles adapted to be successively brought into the path of the liquid, and a bottom closure for and supported relative to the path of the receptacles and independent of the carrier.

5. In a glass measuring and delivery apparatus, the combination with a source of liquid-glass supply, of a rotatable carrier having radially-disposed pockets, open-ended measuring-receptacles removably fitted to and depending from the under side of the carrier in line with the pockets, means for rotating the carrier to bring the receptacles successively in line with the liquid-outlet, and a closure yieldingly supported in line with the liquid-outlet and adapted to serve as a bottom for successive receptacles.

6. In a glass-measuring and delivery apparatus, the combination with a source of liquid-glass supply, of a rotatable carrier open-ended measuring-receptacles depending from the under side of the carrier and means whereby they are brought successively in the path of liquid-supply, and bottom closure means for said receptacles relative to the path thereof, said closure means including a yieldingly-supported plate.

7. In a glass measuring and delivering apparatus, the combination with a melting-pot and a chambered extension thereof adapted to contain molten glass and having a discharge-orifice, a rotatable carrier journaled beneath said extension, receptacles on said carrier registrable successively with said orifice, means within the chamber and operating through said discharge-orifice for aiding the feed to said receptacle, and means independent of said last-named feed-aiding means governing the discharge from the chamber.

8. In glass measuring and delivering apparatus, the combination with a melting-pot and a chambered extension thereof adapted to contain molten glass and having a discharge-orifice, a rotatable carrier, open-ended receptacles on said carrier registrable with said orifice, said carrier arranged to cooperate with the walls of said orifice as a slide-valve to control the flow of the liquid, and a part suitably supported relative to said orifice and arranged to cover and uncover the bottom of the receptacles in the rotation of the carrier.

9. In a glass measuring and delivering apparatus, the combination with a melting-pot and a glass-containing-chamber extension thereof having a discharge-orifice, of a table rotatable relative to said orifice, open-ended receptacles removably secured to the under side of said table and successively registrable with said orifice, a hollow perforated face-plate intermediate the chamber and table and registering with said orifice, connections between the interior of said face-plate and a source of cooling fluid-supply and a yieldingly-supported closure for the receptacles arranged relative to the path of movement of the latter and serving to cover the bottom of a receptacle during one step movement of the carrier and to uncover said receptacle during a succeeding step movement of said carrier.

10. In apparatus of the class described, the combination with a glass-containing chamber having a discharge-orifice and a rotatable table and means for imparting to the same a step-by-step movement, of an open-ended receptacle registrable with said orifice, a yieldingly-supported bottom closure for said receptacle located relative to said orifice said closure having a length approximately equal to the length of one step movement of the table, and means for causing said receptacle to traverse the space intermediate of the discharge end of said orifice and said closure.

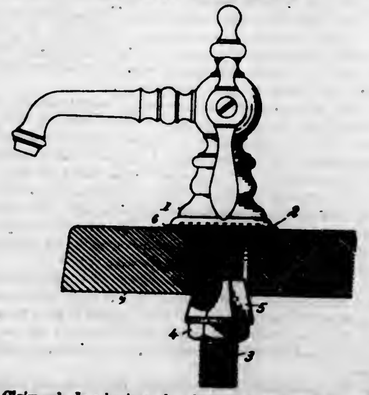
11. In apparatus of the class described, the combination with a melting-pot, and a glass-containing chamber extending therefrom and having a discharge-orifice, of a rotatable carrier journaled beneath said extension, measuring-receptacles thereon registrable successively with said orifice, means for controlling the flow through the latter, and mechanical means for assisting in the filling of said receptacles.

12. In apparatus of the class described, the combination with a melting-pot, and a glass-containing chamber extending therefrom and having a discharge-orifice, of a rotatable carrier journaled beneath said extension, measuring-receptacles thereon registrable successively with said orifice, and mechanical means including a reciprocating plunger for assisting in the filling of said receptacles.

13. In apparatus of the class described, the combination with a glass-containing chamber having a discharge-orifice, of a rotatable carrier, measuring-receptacles thereon registrable successively with said orifice, and cooperating with the mouth of said orifice to control the flow through the latter, and mechanical means including a reciprocating plunger for assisting in the filling of said receptacles, and means for giving said plunger and carrier a coördinate movement.

14. In apparatus of the class described, the combination with a glass-containing chamber having a discharge-orifice a rotatable carrier, measuring-receptacles thereon registrable successively with said orifice, a plunger reciprocal in said orifice and means for giving said plunger and carrier a coördinate movement.

810,168. BASIN-COCK. PHILIP MUELLER, Decatur, Ill., assignor to H. Mueller Manufacturing Company, Decatur, Ill., a Corporation of Illinois. Filed May 20, 1905. Serial No. 261,097.



Claim.—1. In a basin-cock, a base to sit on the slab, a circular fluted extension to pass through a hole in the slab, a threaded end for the fluted extension, a fluted washer adapted to slide on the fluted extension, and a nut for the threaded end.

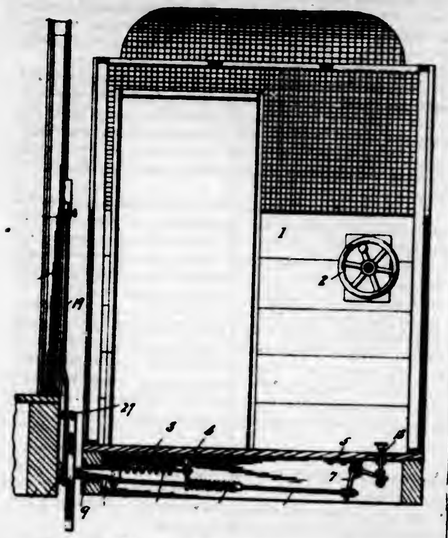
2. In a basin-cock, a base to sit on the slab, a circular fluted extension to extend through a hole in the slab, a threaded end for the fluted extension, an internally-fluted and externally-tapered washer adapted to slide on the fluted extension, and a nut for the threaded end.

3. In a basin-cock, a base to sit on the slab, a fluted extension to pass through the slab, a threaded end for the fluted extension, an internally-fluted and externally-tapered polygonal washer adapted to slide on the fluted extension, and a nut for the threaded end.

4. In a basin-cock, a base to sit on the slab, a fluted extension to

pass through the slab, a threaded end for the fluted extension, an internally-fluted and externally-tapered octagonal washer adapted to slide on the fluted extension, and a nut for the threaded end.

810,169. ELEVATOR-CAGE-DOOR OPENER. SUSSEX MURRAY and WILLIAM B. MURRAY, Washington, D. C. Filed May 31, 1905. Serial No. 262,094.



Claim.—1. The combination with an elevator-car, of a laterally-movable member with a cam-groove and flanges projecting over the same; a door to the elevator-well; and means operating to open said door adapted to be engaged by the cam-groove, and held from lateral disengagement by the flanges.

2. The combination with an elevator-car of a movable cam carried thereby; a well-door, a lever having a fixed fulcrum connected to the door in the path of movement of the cam to be engaged thereby, means for preventing accidental disengagement of the members, and means for operating said cam.

3. The combination with an elevator-car, of a laterally-movable member having a cam-groove therein, of a lever having a fixed fulcrum and provided with a member to engage said groove, means for preventing accidental disengagement of the parts, door-releasing means operated by the lever, and means for operating the cam.

4. The combination with an elevator-car, of a well-door and a pivoted latch thereon, a rod connected to said latch, and a slotted link connected to the rod, a pin in the door located in the slot, an operating-lever connected to the link, and means on the car adapted to engage said lever to release and open the door.

5. The combination with an elevator-car, of a well-door and a pivoted latch thereon, a rod connected to said latch, and a slotted link connected to the rod, a pin in the door located in the slot, an operating-lever connected to the link; a cam member on the car and means on the operating-lever to engage said cam to release and open the door.

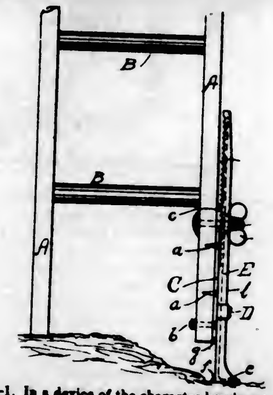
6. The combination with a well-door and a lever connected to open the same, of an elevator-car and a laterally-movable member to engage said lever, an angular plunger integral with said member having bearings in the car-frame, a connecting-rod attached to the plunger, and means to operate said rod.

7. The combination with a well-door and a lever connected to release and open the same, of an elevator-car and a laterally-movable member to engage said lever, an angular plunger integral with said member having bearings in the car-frame, a connecting-rod attached to the plunger, a connecting-rod, a bell-crank lever, and a depressible foot-plunger.

8. The combination with a well-door and a lever connected to release and open the same, a roller on the lever; an elevator-car and a laterally-movable member having a cam-groove therein to engage said roller, a plunger integral with said member having bearings in the car-frame, a connecting-rod attached to the plunger, and means to operate said rod.

9. The combination with a well-door, of a lever connected to release and open the same, a flanged roller on the lever, a laterally-movable member adapted to engage said roller, said member having a cam-groove formed therein, flanges overhanging said groove, a plunger on the member having bearings in the car-frame, a connecting-rod attached to the plunger, and means for operating said rod.

810,170. ADJUSTABLE APPLIANCE FOR LADDERS. MORGAN POTTER, Fishkill-on-the-Hudson, N. Y., assignor to The Morgan Potter Company, Fishkill-on-the-Hudson, N. Y. Filed Sept. 21, 1904. Serial No. 225,209.

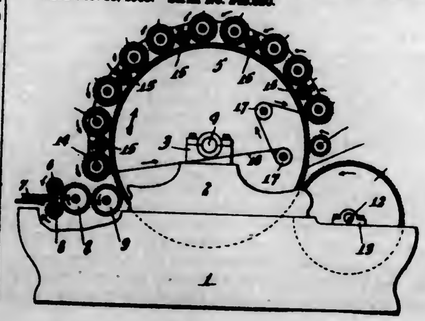


Claim.—1. In a device of the character herein set forth, a sliding piece slotted at its upper part and having serrations on its back and smooth at its lower part, a metallic bed-plate having serrations on its front at its upper part and smooth at its lower part, and having a bridge for crossing the lower portion of the sliding piece, a bolt passing through the serrated part of the bed-plate and through the slot in the sliding piece, the bolt being located above the cross-bridge, and a nut on the bolt, the parts being combined and arranged substantially as shown and described.

2. In a device of the character herein set forth, the combination with the metallic bed-plate, of rearwardly-extending side lugs for bearing on the rounded surface of a ladder-rail, substantially as and for the purposes set forth.

3. The combination with the metallic bed-plate having its outer face serrated at its upper part and smooth at its lower part; of the sliding piece having its inner face serrated at its upper part and smooth at its lower part and its body slotted longitudinally through the serrations, a locking-bolt passing through said slot and through the bed-plate, a thumb-nut on the bolt, longitudinal marginal ribs on the outer face of the sliding piece throughout its lower portion, and a cross-bridge on the bed-plate embracing said sliding piece and into whose angles said marginal ribs bear at points below the bolt.

810,171. CARDING-MACHINE. JAMES J. RAE, Cherry Valley, Mass., assignor of one-half to Channing Smith, Cherry Valley, Mass. Filed Feb. 10, 1905. Serial No. 245,602.

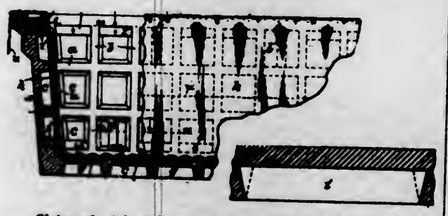


Claim.—1. In a carding-machine, the combination with the main cylinder, of the worker-rolls arranged in pairs, each one of a pair in engagement with the main cylinder, and the stripper-rolls, a stripper-roll for each pair of worker-rolls, and in engagement with each one of the pair, and also in engagement with the main cylinder, and means for rotating the workers and strippers in the same direction and opposite to the direction of rotation of the main cylinder, substantially as shown and described.

2. In a carding-machine, the combination with the main cylinder, of two worker-rolls in engagement therewith, and a stripper-roll in engagement with each of the worker-rolls, and also in engagement with the main cylinder, and means for rotating the workers and the strippers in the same direction and opposite to the direction of rotation of the main cylinder, substantially as shown and described.

3. In a carding-machine, the main cylinder, a worker-roll in engagement therewith and adapted to receive the material therefrom, a second worker-roll in engagement with the main cylinder, and adapted to receive the material therefrom, a stripper-roll in engagement with both worker-rolls, and adapted to receive the material therefrom, and also in engagement with the main cylinder, and adapted to transfer the material from both worker-rolls onto the main cylinder, and means for rotating the workers and strippers in the same direction and opposite to the direction of rotation of the main cylinder, substantially as shown and described.

810,172. BURIAL-CASE. LEWIS V. RATHBUN, Rochester, N. Y. Filed Mar. 18, 1905. Serial No. 250,627.



Claim.—1. A burial-case having a hollow body and a lid or cover therefor both made of cement, upholstery for the interior of the body with flaps loosely overhanging the rim of the body a cloth covering secured to the outer surfaces of said body and the lid, the cloth covering of said lid or cover extending in a loose mantle to cover the joint between the hollow body and its cover.

2. A burial-case comprising a hollow body or receptacle and a cover therefor, the interior of said hollow body being upholstered, and mantles connected with said upholstery within the body and adapted to be turned outward to overhang the hollow body or inward to overhang the said upholstery and a flexible-cloth covering secured to the cover and having a loose depending mantle to cover the joint between the body and cover.

3. A casket-body cover formed with internal intersecting ribs with tapered openings therein, at the points of intersection, conical pins in said openings at the intersection of the ribs, and upholstery secured to said pins and bearing against said pins and ribs.

810,173. LINOTYPE-MACHINE. JOSEPH R. SAFFERT, Brooklyn, N. Y., assignor to Manufacturers' Linotype Company, a Corporation of New York. Filed Oct. 24, 1905. Serial No. 284,179.

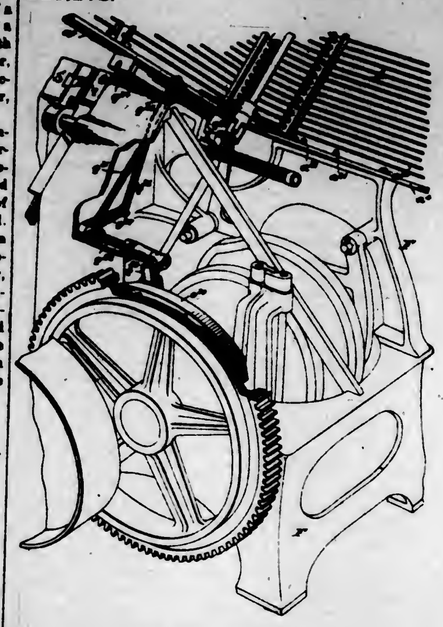
Claim.—1. In a linotype-machine a series of guides and matrices suspended therefrom in combination with an aligning-rib to engage the matrices and automatic means for changing the distance between the guides and the rib.

2. In a linotype-machine the combination of endless guides, notched matrices suspended therefrom, an aligning-surface to engage the matrices, automatic means for changing the distance between the guides and the aligning-surface and means for moving the matrices into forcible engagement with the rib.

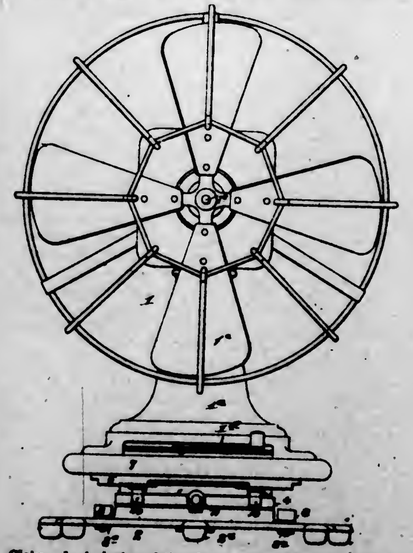
3. In a linotype-machine the base-frame and the aligning-rib and aligning-slide thereon in combination with the top frame containing the matrix-guides, the pendent matrices adapted to engage the aligning-rib, and means for raising the top frame.

4. In combination, the base-frame with means to align the matrices, the vertically-movable top frame with its matrix-guides, the matrices, the eccentric to raise the top frame and automatic means for actuating the eccentric.

810,173.



810,174. OSCILLATING ELECTRIC FAN. GUSTAV SITTHAHN, Brooklyn, N. Y., assignor to Herbert Stanley Brown, New York, N. Y. Filed June 11, 1903. Serial No. 111,094.



Claim.—1. A device of the character described comprising a movable member, a fan and its motor pivotally connected therewith at one side of the axis of said member, and stops to cause said member and fan to oscillate, substantially as described.

2. A device of the character described comprising a pivoted member, means to control its swinging movements, and a fan and its motor pivotally connected with said member at one side of the pivot of

the latter, whereby the stoppage of said member will cause said fan and motor to swing on its pivot, substantially as described.

3. The combination of a base, a member pivotally connected therewith, a fan and its motor pivotally connected with said member at a point eccentric to the pivot of the member, and stops to cause said member to swing on its pivot, substantially as described.

4. In a device of the character described the combination of a base, a member pivotally carried thereby, stops to limit the oscillations of said member, a fan and its motor pivotally carried by said member at a point eccentric to the pivot of the latter, and stops to cause said fan and motor to oscillate, substantially as described.

5. The combination of a base, a member pivotally connected therewith, stops connected with said base on opposite sides of said pivot to limit the oscillations of said member, a support for a fan and motor pivotally carried by said member at a point eccentric to the pivot thereof, and stops to control the oscillations of said support, substantially as described.

6. The combination of a base, a member pivotally carried thereby, stops adjustably carried by said base to be engaged by an abutment on said member, a support for a fan and its motor pivotally carried by said member at a point eccentric to the pivot of the latter stops adjustably connected with said support, and a buffer or abutment on said member to coact with said stops, substantially as described.

7. In a device of the character described the combination of a base and a fan and its motor, with a pair of pivots interposed between said base and motor, means for connecting the fan and motor with one of said pivots, said pivots being disposed eccentrically to each other whereby the fan and motor may oscillate on its vertical axis with relation to one pivot and may oscillate bodily on an arc described around the other pivot, and stops for causing such movements of the fan to occur, substantially as described.

8. An electric fan and its motor provided with supporting devices comprising an oscillatory member pivotally supported, a pivotal support alined with the vertical axis of the fan and mounted on said member eccentrically of the axis of the latter, and stops to coact with said member and pivotal support, whereby the fan and motor will be caused to oscillate or move from side to side through the medium of the back pressure of the air-currents propelled from the fan, substantially as described.

9. A device of the character described comprising a movable member, a fan-support pivotally connected therewith, an arm pivotally connected with said member, means to retard the movements of said arm, and stops connected with said fan to be stopped by said arm, substantially as described.

10. A device of the character described comprising a base, a member pivotally connected with said base, stops connected with the latter, an arm pivotally connected with said member, means to retard the movements of said arm, a fan-support pivotally connected with said member, and stops connected with said fan to encounter said arm to cause the fan to swing on its axis, substantially as described.

11. In a fan for agitating the air, a movable member and a fan and its motor pivotally connected therewith at one side of the movable support of said member, whereby the resistance of the outside air to the fan caused by the current produced by the fan-vanes will be in a line to one side of the connection of said member with its base, and cause said member, fan-support and fan to turn.

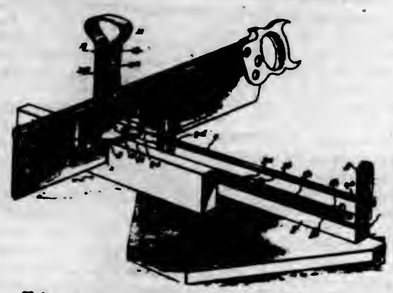
12. In a device of the character described the combination of two parallel pivots, one hinged upon the other, a motor and its fan supported to oscillate as a unit on one of said pivots, and means for limiting the extent of angular movement of each pivot.

13. An oscillating device for a motor-driven fan consisting of the combination of a hinged or pivoted support in two parts or sections, one of which is connected to the other by a hinge or pivot, a motor and fan located upon one section, and means for automatically limiting the extent of the movement of each part or section.

14. An oscillating device for a motor-driven fan consisting of a support in two sections, a ball-bearing pivot for the first section, a ball-bearing pivot for the second section parallel to the pivot for the first section, a motor and fan located on the second section and means for limiting the extent of the movement of each section.

15. A device of the character described, comprising a member mounted for movement in a horizontal plane, a fan and motor connected with said member and capable of movement in a horizontal plane in common with said member under actuation of the air proceeding from the fan and also capable of movement relatively to said member, and means for causing the relative movement of said movably-mounted member and said fan and fan-carrier to vary the direction of the said common movement of the same.

810,175. MITER-BOX AND SAW-GUIDE. JAMES H. SMITH, Wenger, Ont. Filed Aug. 2, 1905. Serial No. 272,202.



Claim.—1. An apparatus of the class described, comprising a base, a straight-edge block secured thereto, a supporting-frame adjustably secured to said block, a rod adjustably supported in said frame, and a saw-guide universally adjustably secured to said rod, substantially as shown and described.

2. In an apparatus of the class described, the combination with a base, and a straight-edge block secured thereto, of a supporting-frame adjustably secured to said block, a rod adjustably supported in said frame, and a saw-guide adjustably secured to said rod.

3. In an apparatus of the class described, a base and a straight-edge block secured thereto, a supporting-frame adjustably secured to said block, a rod adjustably supported in said frame, a saw-guide comprising a pair of saw-engaging members, means for adjustably connecting said saw-engaging members together, and means for adjustably connecting one of said saw-engaging members to said rod.

4. In an apparatus of the class described, a base, a straight-edge block secured thereto, a supporting-frame comprising a U-shaped member having a slotted base portion and slotted standards at each end of said base portion, bolts passing through said straight-edge block and said base portion of the U-shaped supporting-frame to adjustably secure the frame to the block, a rod passing through the slotted standards of said supporting-frame and adjustably secured thereto, a saw-guide comprising a pair of saw-engaging members each consisting of a sheet-metal plate, a block carried by each of said sheet-metal plates for engaging the saw, a pair of semicircular guides disposed at right angles to each other and pivotally secured to one of said plates, said semicircular guides passing through apertures in said rod, and means for securing said guides to said rods in their various adjusted positions and means for securing said saw-engaging members together substantially as shown and described.

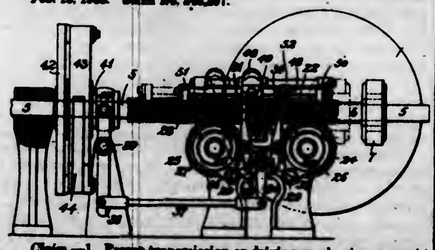
5. In an apparatus of the class described, a base, a straight-edge block secured thereto, a supporting-frame comprising a U-shaped member having a slotted base portion and slotted standards at each end of said base portion, bolts passing through said straight-edge block and said base portion of the U-shaped supporting-frame to adjustably secure the frame to the block, a rod passing through the slotted standards of said supporting-frame and adjustably secured thereto, a saw-guide comprising a pair of saw-engaging members each consisting of a sheet-metal plate, a block carried by each of said sheet-metal plates for engaging the saw, a pair of semicircular guides disposed at right angles to each other and pivotally secured to one of said plates, said semicircular guides passing through apertures in said rod, and means for securing said guides to said rods in their various adjusted positions and means for securing said saw-engaging members together, said last-named means comprising a bow-spring secured to said plates.

6. In an apparatus of the class described, a base, a straight-edge block secured thereto, a supporting-frame comprising a U-shaped member having a slotted base portion and slotted standards at each end of said base portion, bolts passing through said straight-edge block and said base portion of the U-shaped supporting-frame to adjustably secure the frame to the block, a rod passing through the slotted standards of said supporting-frame and adjustably secured thereto, a saw-guide comprising a pair of saw-engaging members each consisting of a sheet-metal plate, a block carried by each of said sheet-metal plates for engaging the saw, a pair of semicircular guides disposed at right angles to each other and pivotally secured to one of said plates, said semicircular guides passing through apertures in said rod, and means for securing said guides to said rods in their various adjusted positions and means for securing said saw-engaging members together, said last-named means comprising a bow-spring secured to said plates, and means for adjusting said saw-engaging members toward each other.

7. An apparatus of the class described, comprising a base, a straight-edge elongated block secured at the rear edge of said base, a supporting-frame consisting of an elongated slotted base portion secured to said elongated straight-edge block, bolts passing through said block and said slotted base portion of the supporting-frame for adjustably securing the same to the block, said supporting-frame also comprising slotted end standards, an elongated rod adjustably held in said slotted end standards, means on said rod for holding the same in position on said standards, said rod having one end provided with a vertical and a horizontal slot, a saw-guide consisting of a pair of sheet-metal plates dovetailed in cross-section, a pair of saw-engaging blocks having dovetailed portions held by said plates, a bow-spring secured to said plates to hold the saw-engaging members in position, an adjusting-bolt carried by said bow-spring for adjusting the saw-engaging members toward each other, one of said plates having a pair of ears stamped therefrom and arranged in parallel vertical planes, a semicircular arcuate member pivotally secured to said ears and passing through the horizontal slot of the rod, said last-named plate having a pair of ears stamped therefrom and arranged in horizontal planes midway between the first-mentioned ears, a second semicircular arcuate member pivotally secured to said last-named ears and passing through the vertical slot of the rod and set-screws carried by said rod for coöperating with said semicircular arcuate members to lock them in their adjusted positions all being arranged substantially as shown and described.

8. An apparatus of the class described, comprising a base, a straight-edge elongated block secured at the rear edge of said base, a supporting-frame consisting of an elongated slotted base portion secured to said elongated straight-edge block, bolts passing through said block and said slotted base portion of the supporting-frame for adjustably securing the same to the block, said supporting-frame also comprising slotted end standards, an elongated rod adjustably held in said slotted end standards, means on said rod for holding the same in position on said standards, said rod having one end provided with a vertical and a horizontal slot, a saw-guide consisting of a pair of sheet-metal plates dovetailed in cross-section, a pair of saw-engaging blocks having dovetailed portions held by said plates, a bow-spring secured to said plates to hold the saw-engaging members in position, an adjusting-bolt carried by said bow-spring for adjusting the saw-engaging members toward each other, one of said plates having a pair of ears stamped therefrom and arranged in parallel vertical planes, a semicircular arcuate member pivotally secured to said ears, and passing through the horizontal slot of the rod, said last-named plate having a pair of ears stamped therefrom and arranged in horizontal planes midway between the first-mentioned ears, a second semicircular arcuate member pivotally secured to said last-named ears and passing through the vertical slot of the rod and set-screws carried by said rod for coöperating with said semicircular arcuate members to lock them in their adjusted positions, said saw-engaging blocks having upwardly-extending edges for coöperating with the rib of a stiff-back saw to form guides therefor, all being arranged substantially as shown and described.

810,176. POWER-TRANSMISSION MECHANISM. JOHN H. TRAUERNICHT, Charleston, W. Va., assignor to Universal Electric Equipment Company, Birmingham, Ala., a Corporation of Alabama. Filed Feb. 13, 1905. Serial No. 245,267.



Claim.—1. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft having a friction-wheel and having right-hand and left-hand screws, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, means for engaging one screw or the other to shift the friction-wheel toward and from the center of the friction-disk, and actuating mechanism governed by the speed of one shaft for automatically operating said means to compensate for variations in rate of speed of the driving-shaft.

2. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft, a friction-wheel carried thereby right-hand and left-hand screws on the driven shaft, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, idle worm-wheels engaging said screws, and means automatically controlled by the speed of the driven shaft for checking rotation of either worm-wheel to shift said sleeve and thereby adjust the position of said friction-wheel with relation to said friction-disk to compensate for variations in the rate of rotation of the driving-shaft.

3. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a slidable sleeve or hollow shaft splined thereon having oppositely-threaded screws and a friction-gear also carried thereby, a coactive driving friction-disk or face-wheel, idle worm-wheels in mesh with said screws, brake-bands or friction-rings associated with the hubs or flanges of said worm-wheels, an interposed brake-actuating lever connected with said brake-bands for applying or tightening one or the other, and actuating mechanism therefor automatically governed by the speed of rotation of the shaft.

4. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a slidable sleeve or hollow shaft splined thereon having oppositely-threaded screws and a friction-gear also carried thereby, a coactive driving friction-disk or face-wheel, idle worm-wheels in mesh with said screws, brake-bands or friction-rings associated with the hubs or flanges of said worm-wheels, brake-trips pivoted to the free ends of said bands and spring-forced apart, an interposed, brake-actuating lever having opposite arms engaging said trips and adapted to apply one brake or the other when said lever is rocked, automatic actuating mechanism for said lever, and trippets carried by said sleeve adapted to engage said brake-trips and disengage them from the brake-actuating lever to release the brakes.

5. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft having a friction-wheel and having right-hand and left-hand screws, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, means for engaging one screw or the other to shift the friction-wheel toward and from the center of the friction-disk, and actuating mechanism governed by the speed of one shaft for automatically operating said means to compensate for variations in rate of speed of the driving-shaft, said actuating mechanism comprising a centrifugal governor on the driven shaft and operative connections between the same and said screw-engaging devices.

6. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft having a friction-wheel and having a right-hand and left-hand screws, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, idle worm-wheels engaging said screws, and means automatically controlled by the speed of the driven shaft for checking rotation of either worm-wheel to shift said sleeve and thereby adjust the position of said friction-wheel with relation to said friction-disk to compensate for variations in the rate of rotation of the driving-shaft, and means carried by said slidable sleeve for positively releasing the breaking of the worm-wheels as the friction-wheel is moved to one or the other of its extreme positions.

7. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a friction-wheel on said driven shaft, coactive friction-disks or face-wheels driven by said driving-shaft and arranged at opposite sides of said friction-wheel, and means for moving one of said disks or face-wheels into driving contact with said friction-wheel when the driving-shaft rotates in one direction and the other when said driving-shaft rotates in the opposite direction.

8. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a friction-wheel carried thereby, and driving friction-disks or face-wheels at opposite sides of the periphery of said friction-wheel, said driving-wheels having parallel threaded hubs, and power-applying pulleys engaging said hubs, said pulleys being internally threaded.

9. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a friction-wheel carried thereby, and confronting driving face-wheels or friction-disks at opposite sides of the periphery of said friction-wheel, each face-wheel having a limited movement longitudinally of its axis and having a threaded hub.

internally-threaded pulleys engaging said hubs, said pulleys being confined against lateral movement, and the threads of both hubs being substantially parallel or in the same direction.

10. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft, a friction-wheel carried thereby right-hand and left-hand screws on said driven shaft, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, and automatic means for engaging one screw or the other to shift the friction-wheel toward and from the center of the friction-disk to compensate for variations in rate of speed of the driving-shaft.

11. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft, a friction-wheel carried thereby right-hand and left-hand screws on said driven shaft, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, idle worm-wheels engaging said screws, and means automatically controlled by the speed of one of said shafts for checking rotation of the worm-wheels to shift said sleeve and thereby adjust the position of said friction-wheel with relation to said friction-disk to compensate for variations in the rate of rotation of the driving-shaft.

12. Power-transmission or driving mechanism comprising, in combination, a friction-disk or face-wheel, a slidable shaft having oppositely-threaded screws and having a friction-gear coactive with said friction-disk or face-wheel, and automatic means for engaging the screws to shift said shaft.

13. Power-transmission or driving mechanism comprising, in combination, a friction-disk or face-wheel, a slidable shaft provided with oppositely-threaded screws and a friction-gear carried by said shaft and coactive with said friction-disk or face-wheel, idle worm-wheels in mesh with said screws, and an automatic brake adapted to check rotation of the brake-wheels.

14. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a slidable sleeve or hollow shaft splined thereon having oppositely-threaded screws and a friction-gear also carried by said sleeve, a coactive driving friction-disk or face-wheel, idle worm-wheels in mesh with said screws, brake-bands or friction-rings associated with the hubs or flanges of said worm-wheels, an interposed T-shaped lever having opposite arms connected with said brake-bands, and actuating mechanism connected with the medial arm of said T-shaped lever.

15. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a slidable sleeve or hollow shaft splined thereon having a friction-wheel and oppositely-threaded screws, a driving friction-disk or face-wheel coactive with said friction-wheel, automatic screw-engaging devices adapted for shifting the position of the friction-wheel with respect to the driving friction-disk, and automatic screw-releasing devices for preventing shifting of said friction-wheel beyond certain limits.

16. Power-transmission or driving mechanism comprising, in combination, a driven shaft, a slidable sleeve or hollow shaft splined thereon having oppositely-threaded screws and a friction-gear also carried thereby, a driving friction-disk or face-wheel coactive with said friction-gear, idle worm-wheels in mesh with said screws, spring brake-bands surrounding the hubs or flanges of said worm-wheels, each brake-band having a fixed end, brake-trips pivoted to the free ends of said bands and spring-forced apart, an interposed T-shaped lever having opposite arms engaging said trips and adapted thereby to apply one brake or the other, a centrifugal governor on the shaft and operative connections between the same and the medial arm of said T-shaped lever, and trippets carried by said sleeve adapted to engage said brake-trips and thereby disengage them from said T-shaped lever to release the brakes.

17. Power-transmission or driving mechanism comprising, in combination, driving and driven shafts, a slidable sleeve or hollow shaft splined on the driven shaft having a friction-wheel and having right-hand and left-hand screws, a friction-disk or face-wheel driven by the driving-shaft and coactive with said friction-wheel, speed-controlled means for engaging said screws for shifting said sleeve to adjust the position of said friction-wheel with relation to said friction-disk, and means carried by said sleeve for disengaging or releasing said screw-engaging means as the friction-wheel is moved to one or the other of the extreme positions.

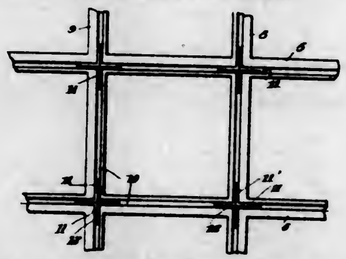
810,177. TRIGGER MECHANISM FOR SMALL-ARMS. SAMUEL JOHN TAUSSIG, Trieste, Austria-Hungary. Filed June 13, 1903. Serial No. 161,233.

Claim.—1. In a trigger mechanism of the character described, the combination with the trigger, of two coacting elements operated from the trigger comprising a striker having a head, and a sear, two bearing-points formed on one of the coacting surfaces of the said two coacting elements, said bearing-points operating to give an interval of rest after the disengagement of one of the coacting elements from the first bearing-point on the other element and before it is released from the second bearing-point.

2. In a trigger mechanism of the character described the combination with the trigger of two coacting elements operable from the trigger comprising a striker having a head and a sear, and a series of bearing-points formed on one of the coacting elements, said bearing-points operating to give a series of intervals of rest after the disengagement of one of the coacting elements from the first bearing-point on the other element and before it is released from the final bearing-point for the purpose specified.

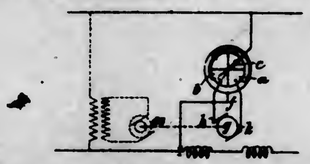
3. The combination with a trigger *f*, of a sear *d*, operated by the trigger, a striker having a head *b*, and two bearing-points formed on the head operating to give an interval of rest after the disengagement of the sear from the first bearing-point of the striker-head and before it is released from the second bearing-point.

810,178. RAILWAY-CROSSING. RICHARD H. WALTON, Los Angeles, Cal. Filed Sept. 13, 1905. Serial No. 278,343.



Claim.—A bridge for railway-rail crossings comprising a body having a plurality of resilient tapered arms adapted to fit into the flange-channels of the railway-rail crossing at their intersection, said body being raised slightly above the bottom of the flange-channels, and the ends of the arms resting upon the bottom of the flange-channels and having central grooves in the top of the arms and body.

810,179. APPARATUS FOR MEASURING WATTS IN ELECTRICAL CIRCUITS. HERBERT WILSON, London, England. Filed Dec. 17, 1904. Serial No. 237,275.



Claim.—1. Apparatus for measuring the watts in electrical systems comprising, in combination with the primary conductors, a secondary electric system, means for producing between two points in the secondary system a potential which varies with the current in the work-circuit and is always proportional thereto, an electrometer, means connecting the pairs of quadrants of said electrometer to the said two points in the secondary system, and means connecting the case and the needle of the electrometer to the points between which the watts are to be measured.

2. Apparatus for measuring the watts in electrical systems comprising, in combination with the primary conductors, a secondary electric system, means for producing between two points in the secondary system a potential which varies directly with the current in the work-circuit, an electrometer, means connecting the pairs of quadrants of said electrometer to said two points in the secondary system, means connecting the case and the needle of the electrometer to the points between which the watts are to be measured, and means connecting one of the pairs of quadrants to the case.

3. Apparatus for measuring the watts in electrical systems comprising, in combination with a plurality of primary conductors, a plurality of secondary electrical systems, means for producing between two points in each such a system a potential which varies directly with the current in one of the primary conductors, a plurality of electrometers, means connecting the pairs of quadrants in each electrometer to the two points in one of the secondary systems, and means connecting the cases and needles of the electrometers to the points between which the watts are to be measured.

4. Apparatus for measuring the watts in electrical systems comprising, in combination with a plurality of primary conductors, a plurality of secondary electric systems, means for producing between two points in each such system a potential which varies directly with the current in one of the primary conductors, a plurality of electrometers and insulating means connecting the spindles of their needles together, means connecting the pairs of quadrants in each electrometer to the two points in one of the secondary systems, and means connecting the cases and needles of the electrometers to the points between which the watts are to be measured.

5. Apparatus for measuring the watts in electrical systems comprising, in combination with a plurality of primary conductors, a plurality of secondary electric systems, means for producing between two points in each such system a potential which varies directly with the current in one of the primary conductors, a plurality of electrometers, means connecting the pairs of quadrants in each of said electrometers to the two points in one of the secondary systems, means connecting the cases and needles of the electrometers to the points between which the watts are to be measured, and means connecting one pair of quadrants in each electrometer to the case.

6. Apparatus for measuring the watts in electrical systems comprising, in combination with the primary conductors, a dynamo-electric machine the field of which is produced by the current in the work-circuit, means for driving the armature of said machine at constant speed, a secondary electric system connected to the brushes of the machine, an electrometer, the pairs of quadrants of which are in the secondary system, and means connecting the case and needle of the electrometer to the points between which the watts are to be measured.

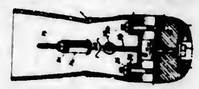
7. Apparatus for measuring the watts in electrical systems comprising, in combination with a plurality of primary conductors, a plurality of dynamo-electric machines through the field-coils of each of which the primary current of one of said conductors is taken, means for driving the armature of each machine at constant speed, a plurality of secondary electric systems each connected to the brushes of one of the machines, a plurality of electrometers the pairs of quadrants of which are in the respective secondary systems, and means connecting the cases and needles of said electrometers to the points between which the watts are to be measured.

8. Apparatus for measuring the watts in electrical systems comprising, in combination with a plurality of primary conductors, a plurality of dynamo-electric machines through the field-coils of each of which the primary current of one of said conductors is taken, means for driving the armature of each machine at constant speed, a plurality of secondary electric systems each connected to the brushes of one of the machines, a plurality of electrometers and insulating means connecting their spindles, the pairs of quadrants in each electrometer being connected in one of the secondary systems, and means connecting the cases and needles of the electrometers to the points between which the watts are to be measured.

9. Apparatus for measuring the watts in alternating-current systems comprising, in combination with two primary conductors carrying working currents of different phases and two other primary conductors each earthed at one point and connected to one end of a phase-winding in the generating-station, two dynamo-electric machines the field-coil of each of which is connected in one of the earthed primary conductors, means for driving the armatures of said machines at constant speed, two electrometers and insulating means connecting the spindles of their needles, means connecting the pairs of quadrants in each electrometer each to one of the brushes of the dynamo-electric machines, and connections between the cases of the electrometers and earth, and between the needles of the electrometers and the respective primary conductors carrying the working currents.

10. Apparatus for measuring the watts in alternating-current systems comprising, in combination with two primary conductors carrying working currents of different phases and two other primary conductors each earthed at one point and connected to one end of a phase-winding in the generating-station, two dynamo-electric machines the field-coil of each of which is connected in one of the earthed primary conductors, means for driving the armatures of said machines at constant speed, two electrometers and insulating means connecting the spindles of their needles, means connecting the pairs of quadrants in each electrometer each to one of the brushes of the dynamo-electric machines, and connections between the cases of the electrometers and earth between the cases and one pair of quadrants in each, and between the needles of the electrometers and the respective primary conductors carrying the working currents.

810,180. ARTIFICIAL LIMB. HARRIS C. WHITEHURST, Kansas City, Mo. Filed May 2, 1905. Serial No. 258,455.



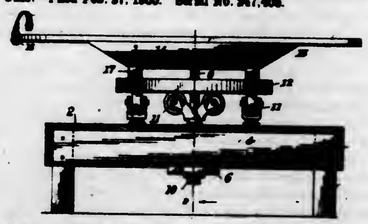
Claim.—1. In a device of the class described, a hollow ankle, a suitable foot carrying an ankle-joint, lugs 34 integral with and projecting into said ankle, and means carried by said lugs for supporting said ankle-joint.

2. In a device of the class described, a hollow ankle and suitable foot, a pair of lugs integral with and projecting into said ankle at opposite sides thereof, a pin carried by said lugs, and a heel-cord carried by said pin and connected with said foot.

3. In a device of the class described, in combination with a hollow ankle, a foot portion pivotally connected with said ankle, a pair of brackets projecting from opposite sides from the rear of said ankle, a pin mounted in said brackets, a sleeve 37 on said pin, and a heel-cord supported on the sleeve on said pin, substantially as and for the purpose set forth.

4. In a device of the class described, in combination with a suitable foot, a hollow ankle pivotally connected with said foot, a pair of brackets 23 projecting inwardly from the rear of said ankle, a pin extending through said brackets having a head at one end and a threaded pocket in the other end, a screw adapted to fit within said pocket, the heads of said pin and said screw being countersunk in said ankle, and a heel-cord carried by said pin and anchored in the heel of said foot.

810,181. SHEEP-SHEARING TABLE. ALBERT BARTH, Pawpaw, Ill., assignor to S. A. John, Pawpaw, Ill., and J. L. Kratz, Columbus, Ohio. Filed Feb. 27, 1905. Serial No. 247,406.

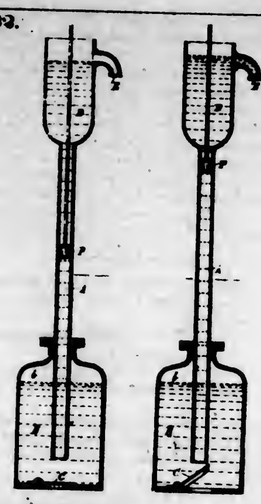


Claim.—A sheep-shearing table, comprising a stationary table and the revolving table rotatably mounted thereon, caster-wheels rigidly secured on the top of the stationary table, a bearing-plate underneath the revolving table and resting on said caster-wheels, a pivot-bolt rigidly secured to the stationary table, an aperture intermediate of the bearing-plate through which said pivot-bolt passes, allowing the revolving table to rotate upon the stationary table, substantially as described.

810,182. PUMP. HENRI BRAU, Paris, France. Filed June 27, 1903. Serial No. 163,534.

Claim.—The combination with a lower reservoir and an inwardly-opening valve arranged in the bottom thereof, of an upper reservoir, a tube leading from the latter down within the lower reservoir to a point somewhat below the upper end of the lower reservoir whereby when water is within the latter an air-space will be formed above the surface of the water as described, and a piston fitting loosely within the tube, all arranged as and for the purpose set forth.

810,182.



810,183. BRACELET. ANTHONY H. BLAIR, North Attleboro, Mass. Filed Sept. 13, 1905. Serial No. 278,296.

Claim.—1. In a device of the class described, the combination of a pair of curved members and a link slidably connecting adjacent ends thereof, said link being curved in an opposite direction to said members.

2. In a device of the class described, the combination of a pair of curved members and an oppositely-curved link seated in and slidably connecting adjacent ends thereof, and yielding means for holding one end of said link in one of said ends.

3. In a device of the class described, the combination of a pair of curved tubular members, disks located in adjacent ends of said members, a slot in each of said disks, a link passing through the slot in each disk, and yielding means for holding one end of said link in one of said members.

4. In a device of the class described, the combination of a pair of members having perforated end disks, a link passing through said perforations and terminating at one end within one member in a head, and yielding means in the other of said members for holding the other end of said link.

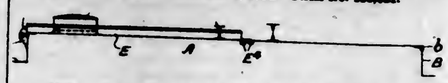
5. In a device of the class described, the combination of a pair of adjacent ends, a disk having a perforation located in each of said ends, a fastening passing through one of said perforations and forming a spring-catch at its outer end, and a hook at its inner end, substantially as and for the purpose specified.

6. In a device of the class described, the combination of a pair of members, one of said members being tubular, a link located in and slidably connecting one pair of adjacent ends, a fastening for the other pair of adjacent ends and located in the said tubular member, said fastening forming a catch on its external end, and a hook on its internal end, and a spring fastened at one end to said hook and at the other end to the end of the said link located in said tubular member, substantially as and for the purpose specified.

810,184. CARVED GUM-FORM. WILLIAM BRADBURY, Salt Lake City, Utah. Filed July 6, 1905. Serial No. 268,968.

Claim.—A section-rim shaped to fit between the teeth and cheeks of the face, carrying a carved gum-form, shaped similar to the natural gums, with the lower part cut to fit over the artificial teeth, that are attached to the foundation-cast of a model for a denture.

810,185. COVER FOR SHIPS' HATCHWAYS. HENRY BURRELL, Glasgow, Scotland. Filed Jan. 7, 1904. Serial No. 188,621.



Claim.—1. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, compressible material interposed between the coaming and the cover for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, substantially as shown and described.

2. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, a gasket for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, substantialy as shown and described.

3. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, a rope-gasket for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, substantially as shown and described.

4. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, compressible material interposed between the coaming and the cover for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, said wedges being so secured in the sockets as to be incapable of accidental absolute removal from such sockets, substantially as shown and described.

5. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, a gasket for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, said wedges being so secured in the sockets as to be incapable of accidental absolute removal from such sockets, substantially as shown and described.

6. In a closure for ships' hatchways the combination with the cover comprising a door proper having a plain bottom surface, of an outside beam, stiffening-bars at right angles connected with said beam, a coaming, a stiffening-bar for said coaming, a rope-gasket for making a tight joint between the same, bars pivoted on said coaming having wedge-sockets, and wedges located in said sockets for securing the cover in position when driven home, said wedges being so secured in the sockets as to be incapable of accidental absolute removal from said sockets, substantially as shown and described.

810,186. SMOKING ATTACHMENT FOR HARVESTER-BINDERS. JAMES GALBRA, Hamilton, Canada, assignor of one-half to George Skelton Hughson, Hamilton, Canada. Filed July 9, 1903. Serial No. 164,963.

Claim.—1. In a machine of the class described, the combination with the binder-deck, of a bar extending lengthwise thereof, a knotter-shaft located parallel therewith and carrying ejector-arms, arms extending from said bar to the opposite side of the knotter-shaft, a supplemental shaft journaled in said arms with means for operating it, and supplemental ejector-arms carried by said supplemental shaft, substantially as described.

2. In a machine of the class described, the combination with the binder-deck, and the knotter-shaft carrying ejector-arms, of a bar extending lengthwise of the binder-deck on one side of the knotter-shaft, arms extending from said bar to the opposite side of the knotter-shaft, bearings in the ends of the arms, a supplemental shaft journaled in said bearings; supplemental ejector-arms on said supplemental shaft, a crank-arm on the supplemental shaft, and a pitman connected to said crank-arm with means for operating the pitman, substantially as described.

3. In a machine of the class described, the combination with the binder-deck and the knotter-shaft carrying ejector-arms, of a bar extending lengthwise of the binder-deck on one side of the knotter-shaft, arms extending from said bar to the opposite side of the knotter-shaft, bearings in the ends of the arms, a supplemental shaft journaled in said bearings, supplemental ejector-arms on said supplemental shaft, a crank-arm on the supplemental shaft, and a pitman connected to said crank-arm, a spindle located above the knotter-shaft having an end crank connected to said pitman and means for driving said spindle, substantially as described.

4. In a machine of the class described, the combination with the binder-deck and the knotter-shaft carrying ejector-arms, of a bar extending lengthwise of the binder-deck on one side of the knotter-shaft, arms extending from said bar to the opposite side of the knotter-shaft, a supplemental shaft journaled in bearings in said arms, supplemental ejector-arms carried by said supplemental shaft, a crank-arm on said supplemental shaft, a spindle located above the knotter-shaft having a crank-arm, a rod or pitman connecting said crank-arm with the arm on the supplemental shaft, and means for driving said spindle, substantially as described.

5. In a machine of the class described, the combination with the binder-deck and the knotter-shaft carrying ejector-arms, of a bar extending lengthwise of the binder-deck on one side of the knotter-shaft, arms extending from said bar to the opposite side of the knotter-shaft, a supplemental shaft journaled in bearings in said arms, supplemental ejector-arms carried by said supplemental shaft, a crank-arm on said supplemental shaft, a spindle located above the knotter-shaft having a crank-arm, a rod or pitman connecting said crank-arm with the arm on the supplemental shaft, and means for driving said spindle, comprising a sprocket-wheel on the end of the spindle, a pusher-shaft, a sprocket-wheel on the end thereof, and a sprocket-chain connecting said sprocket-wheels, substantially as described.

6. In a device of the class described, the combination with the binder-deck, of a knotter-shaft above the deck, ejector-arms carried by said knotter-shaft, a supplemental shaft arranged parallel with the knotter-shaft with means for supporting it, supplemental ejector arms carried thereby a crank-arm on the supplemental shaft, a spindle provided with a crank-arm, a rod connecting said crank-arms, a gear-wheel for rotating the spindle and means for controlling the movement of said spindle, substantially as described.

7. In a device of the class described, the combination with the binder-deck, of a knotter-shaft above the deck, ejector-arms carried by said knotter-shaft, a supplemental shaft arranged parallel with the knotter-shaft with means for supporting it, a crank-arm on the supplemental shaft, a spindle provided with a crank-arm, a rod connecting said crank-arms, a sprocket-wheel on the end of the spindle, a pusher-shaft, a sprocket-wheel thereon, and a sprocket-chain connecting said sprocket-wheels, substantially as described.

8. In a machine of the class described, the combination with the binder-deck and knotter-shaft carrying the ejector-arms, of a supplemental shaft carrying supplemental ejector-arms with means for oscillating said shaft, and retaining-arms pivoted on said supplemental shaft, a spring tending normally to depress said arms and means for holding said arms elevated against the tension of the spring, substantially as described.

9. In a machine of the class described, the combination with the binder-deck and knotter-shaft carrying ejector-arms, of a supplemental shaft carrying supplemental ejector-arms, means for oscillating said shaft, sheaf-retaining arms pivotally supported on said supplemental shaft, a spring tending to normally depress said arms, and manually-controlled means for holding said retaining-arms elevated against the tension of the spring, substantially as described.

10. In a machine of the class described, the combination with the binder-deck and knotter-shaft carrying ejector-arms, of a supplemental shaft carrying supplemental ejector-arms, means for oscillating said shaft, sheaf-retaining arms pivotally supported on said supplemental shaft, a spring tending normally to depress said arms, and manually-controlled means for holding said retaining-arms elevated against the tension of the spring, said means including a crank-arm connected with one of the arms and a cord connected to said crank-arm and extending into reach of the operator, substantially as described.

11. In a machine of the class described, the combination with the binder-deck and knotter-shaft, of a supplemental shaft located above the deck and parallel with the knotter-shaft with means for operating it, ejector-arms carried by said supplemental shaft for ejecting the sheaves, retaining-arms connected to move in unison and pivotally mounted on said supplemental shaft, an arm pivoted on the shaft and connected to one of the retaining-arms, a spring acting on said arm and tending to depress the retaining-arms, and manually-controlled means for normally holding said retaining-arms elevated against the tension of the spring, substantially as described.

12. In a machine of the class described, the combination with the binder-deck and knotter-shaft, of a supplemental shaft located above the deck and parallel with the knotter-shaft with means for operating it, ejecting-arms carried by said supplemental shaft for ejecting the sheaves, retaining-arms connected to move in unison and pivotally mounted on said supplemental shaft, an arm pivoted on the shaft and connected to one of the retaining-arms, a pin on said arm, a spring acting on said pin and tending to depress the retaining-arms, a cord connected to the said arm, and means for holding the end of the cord, substantially as described.

13. In a machine of the class described, the combination with the binder-deck and knotter-shaft, of a supplemental shaft located above the deck and parallel with the knotter-shaft with means for operating it, ejecting-arms carried by said supplemental shaft for ejecting the sheaves, retaining-arms connected to move in unison and pivotally mounted on said supplemental shaft, an arm pivoted on the shaft and connected to one of the retaining-arms, a pin on said arm, a spring acting on said pin and tending to depress the retaining-arms, a cord connected to the said arm, and means for holding the end of the cord, said means comprising a forked arm on the frame and stop on the cord for engaging said fork, substantially as described.

14. In a machine of the class described, the combination with the binder-deck, of an apron angular in cross-section having one edge secured to the lower edge of the binder-deck, and having slots to permit operating mechanism to project therethrough, substantially as described.

15. In a machine of the class described, the combination with the binder-deck, of an apron angular in cross-section having one edge secured to the lower edge of the binder-deck and having slots to permit operating mechanism to project therethrough, and a second apron secured to the outer edge of said first-named apron, substantially as described.

16. In a machine of the class described, the combination with the binder-deck, of an apron angular in cross-section having one edge secured to the edge of the binder-deck and forming a continuation thereof, said apron having slots, a second apron secured to the opposite edge of said apron, a vertically-disposed apron secured to the

angular apron at one end, and an additional vertical apron carried by the frame and in the place of said first vertical apron, substantially as described.

17. In a machine of the class described, the combination with the binder-deck and sheaf binding and ejecting mechanism, of a horizontally-disposed receiving-apron secured to the lower edge of the binding-deck, a second apron secured to the outer edge of said receiving-apron, vertically-disposed aprons at the end of said receiving and said second aprons, and shock-binding mechanism, substantially as described.

18. In a machine of the class described, the combination with the binder-deck and sheaf binding and ejecting mechanism, of a horizontally-disposed receiving-apron secured to the lower edge of the binding-deck, a second apron secured to the outer edge of said receiving-apron, vertically-disposed aprons at the end of said receiving and said second aprons, means for compressing and binding the grain and a suitable shock-carrier, substantially as described.

19. In a shocker, the combination with the counter-shaft and knotter-shaft and arms located on the counter-shaft outside of the knotter-shaft and the spindle and driving connections between the spindle and countershaft, of the sprocket-wheel on the spindle, a clutch mechanism connecting said sprocket-wheel and said spindle and provided with a dog a packer-shaft and driving connection between such sprocket-wheel and the packer-shaft, a lever suitably pivoted in the frame and having one end designed to engage with said dog and means for tilting such lever, so as to free the dog and allow the sprocket-wheel and mechanism driven therefrom to operate and deliver the sheaf as and for the purpose specified.

20. In a shocker, the combination with the counter-shaft knotter-shaft and packer-shaft and arms located on the counter-shaft outside of the knotter-shaft and the spindle and driving connections between the spindle and counter-shaft, of the sprocket-wheel on the spindle, a clutch mechanism between said sprocket-wheel and said spindle and driving connection between such sprocket-wheel and the packer-shaft, a lever suitably pivoted in the frame a dog on the clutch mechanism designed to be engaged by one end of said lever, a rod supported on the binder-deck and extending longitudinally thereof and an arm on the front end of the rod and a rod connecting such arm with the lever aforesaid and means for oscillating the rod by the delivery of the sheaf as and for the purpose specified.

21. In a shocker, the combination with the counter-shaft knotter-shaft and packer-shaft and arms located on the counter-shaft outside of the knotter-shaft and the spindle and driving connections between the spindle and counter-shaft, of the sprocket-wheel on the spindle, a clutch mechanism between said sprocket-wheel and said spindle a dog on said clutch mechanism and driving connection between such sprocket-wheel and the packer-shaft, a lever suitably pivoted in the frame and having one end designed to engage with said dog, a rod supported on the binder-deck and extending longitudinally thereof and an arm on the front end of the rod and a rod connecting such arm with the lever aforesaid, an arm on the opposite end of the longitudinally-supported rod and means for depressing such arm operated by the delivery of the sheaf as and for the purpose specified.

22. In a shocker, the combination with the counter-shaft knotter-shaft and packer-shaft and arms located on the counter-shaft outside of the knotter-shaft and the spindle and driving connections between the spindle and counter-shaft, of the sprocket-wheel on the spindle, a clutch thereon having a dog, and driving connections between such sprocket-wheel and the packer-shaft, a lever suitably pivoted in the frame and having one end designed to engage with said dog, a rod supported on the binder-deck and extending longitudinally thereof and an arm on the front end of the rod and a rod connecting such arm with the lever aforesaid, an arm on the opposite end of the longitudinally-supported rod, for the purpose specified.

23. In a shocker, the combination with the bar I' suitably pivoted in the binder-deck and the double arm or dog pivotally secured on the outer end thereof and spring-held, of a counter-wheel suitably journaled and having ratchet-teeth engaged by the dog and the ejecter-arm arranged in proximity to the upper arm of said dog and means for moving the ejecter-arm to cause it to engage said upper arm and to throw the dog downwardly and move the ratchet-wheel the space of one teeth upon the delivery of every sheaf, substantially as described.

24. In a shocker, the combination with the sheck knotter-shaft supported on the binder-deck and the sprocket-wheel loosely supported on the shaft and provided with a collar having a series of teeth in its periphery, of an internal collar provided with an arm spring-held and a dog pivoted on the end of the arm, such arm being normally out of the path of the teeth, a counter-wheel, means for rotating such counter-wheel, a face-tooth extending laterally from the counter-wheel, a bar supported in suitable guideways in the frame and designed to normally extend underneath the dog supported on the arm pivoted in the collar aforesaid, said bar having a bent end, a lever pivoted on the frame and secured to the bent end of the bar, a spring for normally holding the bent end of the bar to the frame, the said lever being designed to be thrown outwardly by the tooth on the face of the counter-wheel on said counter-wheel completing its revolution, so as to release the dog and bind the sprocket-wheel to the shaft as and for the purpose specified.

25. In a sheaf-compressor, the combination with the compressor-arm supported on a suitable shaft and suitably operated, of a bar normally held in proximity to the compressor-arm and means for throwing such bar underneath the compressor-arm when the shock is being bound as and for the purpose specified.

26. In a sheaf-compressor, the combination with the compressor-arm supported on a suitable shaft and suitably operated, of a bar located in proximity to the compressor-arm and provided with a bent end and roller, a supporting-bracket for the same a pin on the bar, a spiral spring encircling the bar and extending between the pin on the same and the bracket, a knotter-shaft, and a cam-wheel thereon provided with a face-cam and designed to coact with the roller on the end of the bar as and for the purpose specified.

27. In a shocker, the combination with the binder-deck, of a shock-knotter and shaft, means for driving the same from the binder mechanism, a rectangular extension-frame located at the front of the machine and swung on the knotter-shaft, a brace supporting the same, a needle-arm journaled on the outer edge of said frame, crank-arms on said needle-arm and said knotter-shaft and a link connecting said arms, substantially as described.

28. In a machine of the class described, the combination with the shock-carrier and means for delivering sheaves thereto, of a rocking shaft in proximity to the shock-carrier, a sleeve forming a bearing for said shaft, said sleeve being capable of a lateral swinging motion, a plurality of compressor-arms extending upward from said shaft, a needle-arm, and connections for rocking said shaft as the needle-arm moves forward, as and for the purpose specified.

29. In a shocker, the combination with the shock-carrier suitably supported on the frame, of the compressor-arms, the shaft carrying the same, the needle-arm, a suitable support for the compressor-arms shaft, means operated from the needle-arm for throwing the compressor-arms on the shock when the needle-arm moves forwardly and a spiral spring connecting the needle-arm with the compressor-arm shaft as and for the purpose specified.

30. In a shocker, the combination with the shock-carrier suitably supported on the frame, of the compressor-arms, the shaft carrying the same, the needle-arm, a suitable support for the compressor-arms shaft, arms on the compressor-arms shaft and rods connecting the arms to the needle-arm for moving the compressor-arms downwardly upon the inward movement of the needle as and for the purpose specified.

31. In a shocker, the combination with the main frame, the extension-frame located at the front of the machine and the shock-carrier, of the needle-arm journaled on the outer end of the extension-frame, the braces extending outwardly and downwardly from the extension-frame, a journal supported thereby at the outside of the shock-carrier, a rock-shaft mounted to rock in said journal, compressor-arms suitably secured to said shaft and means for imparting a rocking motion to said shaft when the needle-arm is caused to move inwardly, substantially as described.

32. In a shocker, the combination with the main frame, the extension-frame located at the front of the machine and the shock-carrier, of the needle-arm journaled on the outer end of the extension-frame, the braces extending outwardly from the extension-frame, a journal supported thereby at the outside of the shock-carrier, a rock-shaft mounted to oscillate in said journal, compressor crank-arms suitably secured to the compressor-arms shaft, arms on the compressor-arms shaft, a rod connecting one of the crank-arms to the needle-arm, an arm on the end of the needle-arm and a rod connecting the second crank-arm to such latter arm as and for the purpose specified.

33. In a device of the character described, a shock-carrier, means for delivering sheaves thereto to form a shock, and means for moving said shock-carrier longitudinally and elevating it to deliver the shock and for folding it, substantially as described.

34. In a device of the character described, a shock-carrier comprising a folding-frame, suitable means for supporting the same, means for delivering sheaves thereto, and means for moving said frame longitudinally and tilting and folding it, substantially as described.

35. In a shocker, a main frame, longitudinal rails supported thereby, trucks adapted to travel on said rails, a longitudinal bar connected to said trucks, bars extending horizontally from said longitudinal bar and a plurality of longitudinal shock-supporting bars secured to said horizontal bars, substantially as described.

36. In a shocker, a shock-carrier comprising the inner side bar, the laterally-extending bars, pivotal connections between the laterally-extending bars and the inner bar, the longitudinal bars pivotally connected to the laterally-extending bars, the extension-arm secured to the rearmost laterally-extending bar and means for throwing such arm down, so as to tilt the laterally-extending bars to lie substantially parallel with the inner side bar when the inner side bar is raised to the substantially vertical position and means for swinging said inner side bar to a vertical position as and for the purpose specified.

37. In a shocker, a shock-carrier comprising the inner side bar, the laterally-extending bars, pivotal connections between the laterally-extending bars and the inner bar, the longitudinal bars pivotally connected to the laterally-extending bars, the extension-arm secured to the rearmost laterally-extending bar, a bar pivotally connected to the extension-arm of the laterally-extending bar, suitable guideways in the carrier-frame for the same and means for operating the aforesaid bar, so as to fold the shocker as and for the purpose specified.

38. In a shocker, a shock-carrier comprising the inner side bar, the laterally-extending bars, pivotal connections between the laterally-extending bars and the inner bar, the longitudinal bars pivotally connected to the laterally-extending bars, the extension-arm secured to the rearmost laterally-extending bar, a bar having one end bent at an angle and the opposite end pivotally connected to the extension-arm of the lateral bar, suitable guides in the carrier-frame for the same, the operating-shaft suitably journaled on brackets on the frame, and the arm on the end of the operating-shaft provided with a notch as shown and for the purpose specified.

39. In a shocker, a shock-carrier comprising the inner side bar, the laterally-exteading bars, pivotal connections between the laterally-extending bars and the inner bar, the longitudinal bars pivotally connected to the laterally-extending bars, the extension-arm secured to the rearmost laterally-extending bar, a bar having one end bent at an angle and its opposite end pivotally connected to the extension of the lateral arm, suitable guides in the carrier-frame for the same, the operating-shaft suitably supported, the arm on the end of the operating-shaft provided with a notch and a guide on the inner side bar of the shock-carrier as and for the purpose specified.

40. In a shocker, the combination with the shock-carrier and supporting-rails suitably supported, of a carriage for supporting the front end of the shock-carrier on the rails, an operating-shaft provided with a suitable crank, a counter-shaft provided with an arm at one end, a pitman connecting such arm with the crank on the operating-shaft, an arm on the outer end of the counter-shaft and a pitman or rod connecting such arm to said carriage as and for the purpose specified.

41. In a shocker, the combination with a suitable carriage and a shock-carrier pivotally connected to the carriage at one end, of means for throwing the carriage rearwardly, an operating-shaft a frame suitably supported on the operating-shaft and provided at the end with a crank-arm pivotally connected to the center of the shock-carrier as and for the purpose specified.

42. In a shocker, the combination with the shock-carrier and the carriage supporting the front end thereof at the inside, of the operating-shaft, the frame supported thereon, the crank-arm having a pivotal connection to the side of the shock-carrier frame and the end of the frame supported on the operating-shaft as and for the purpose specified.

43. In a shocker, the combination with the shock-carrier and means for supporting and elevating the same and causing it to recede rearwardly, of the operating-shaft and a brake-shoe secured thereon and a band with which each brake-shoe comes in contact as and for the purpose specified.

44. In a shocker, the combination with the shock-carrier, the driving-shaft therefor and the knotter-shaft, of a sprocket drive-wheel loose on the shaft, clutch mechanism coacting therewith and provided with a releasing-dog, a trip-spindle, means connected to the knotter-shaft for driving the same, a face-wheel on said trip-spindle, a tooth on said face-wheel, and a bell-crank having one end adapted to normally engage said dog and the opposite end adapted to be engaged by the tooth on said face-wheel and to release the dog on said clutch mechanism, substantially as described.

45. In a shocker, the combination with the shock-carrier and drive-shaft, of a sprocket drive-wheel loose on the shaft, clutch mechanism coacting therewith and provided with a releasing-dog, a bell-crank designed to coact with the dog and spring-held, the shock knotter-shaft, a spindle located thereunder driving means between the knotter-shaft and the spindle and a face-wheel on the spindle provided with a tooth designed to come in contact with the end of the bell-crank as and for the purpose specified.

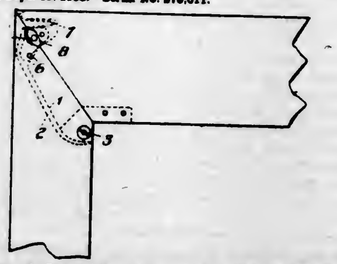
810,187. **PROTECTING-SLEEVE FOR SCREW-PROPELLER SHAFTS.** CARL W. CEDERVALL, Gothenburg, Sweden, administrator of Frans Reinhold Cedervall, deceased. Filed Apr. 3, 1904. Serial No. 201,199.

Claim.—1. A protecting-sleeve for screw-propeller shafts adapted to protect the part of the latter outside of the bushing in the stern-post and comprising rings adjustable in relation to each other, a piston-like ring fitted into an annular opening in one of said rings, and springs adapted to press the said piston-like ring outwardly from its seat, substantially as and for the purpose set forth.

2. A protecting-sleeve for screw-propeller shafts comprising two rings provided on the shaft and serving to protect that part of the same which is outside of the bushing in the stern-post, one of said rings fitted into the other and adjustable thereon; a piston-like ring fitted into an annular opening in the larger ring; and springs interposed between the piston-like ring and its seat on the larger ring to press the former outwardly from the latter, substantially as described and shown.

3. A protecting-sleeve for screw-propeller shafts comprising two rings provided on the shaft and serving to protect that part of the same which is outside of the bushing in the stern-post, one of said rings fitted by screw-threaded connection into the other and adjustable thereon; a piston-like ring fitted into an annular opening in the larger ring; springs interposed between the piston-like ring and its seat on the larger ring to press the former outwardly from the latter; an outer ring provided with an inwardly-extending flange and grooves and surrounding said larger ring, the larger ring being provided with a shoulder and pins which coöperate with the flange and grooves of the outer ring, substantially as and for the purpose described and shown.

810,188. **FOLDING SQUARE.** EDWARD L. COOK, Brattleboro, Vt. Filed Sept. 11, 1905. Serial No. 278,011.



Claim.—1. In a folding square, the members pivoted together with a miter-joint, a tongue on one member entering a groove in the other member, a catch pivoted at the a pexof the joint, a spring keeping the hook end of the catch pressed upon the edge of the tongue, and a pin with which the catch is automatically caused to engage in closing the members.

2. In a folding square, the members pivoted together with a miter-joint, a spring-pressed catch pivoted at the apex of the joint on one member, a pin on the other member for the engagement by the catch, and an adjusting-screw in one member with its head within the joint at its apex for the purpose stated.

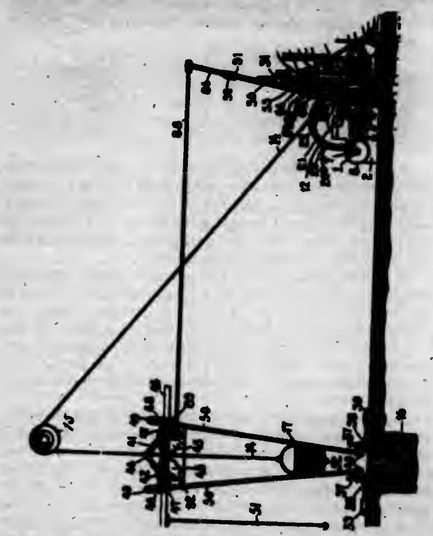
3. In a folding square, the members pivoted together with a miter-joint, a spring-pressed catch having a hook end pivoted at the apex of the joint on one member, a pin on the other member for engagement by the catch, and an adjusting-screw in the hook end of the catch for the purpose stated.

4. In a folding square, the members pivoted together with a miter-joint, a spring-pressed catch having a hook end pivoted at the

spool of the joint on one member, a pin on the other member for engagement by the catch, an adjusting-screw in one member with its head within the joint at its open, and an adjusting-screw in the hook end of the catch substantially as described for the purpose specified.

810,189. SAFETY DEVICE FOR HOISTING MECHANISMS.

WILLIAM COOPER, Denver, Colo. Filed May 5, 1904. Serial No. 206,422.



Claim.—1. In hoists, hoisting mechanism, a device for controlling said hoisting mechanism, a hoisting-receptacle operated by said hoisting mechanism, doors pivoted so as to extend substantially across the path of said hoisting-receptacle so that the ascension of said hoisting-receptacle beyond a predetermined point swings said doors upwardly and outwardly, operative connection between said doors and other operative connection between said doors and said controlling device so that the engagement of said doors by said receptacle actuates said controlling device.

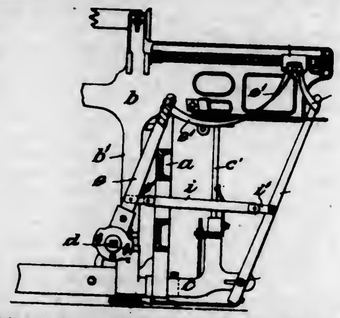
2. In hoists, hoisting mechanism, a device for stopping said hoisting mechanism, a hoisting-receptacle operated by said hoisting mechanism, swing-doors pivoted on opposite sides of the path of said hoisting-receptacle and normally projecting into said path so that the ascension of said receptacle beyond a predetermined point swings said doors outwardly and upwardly, segmental gears rigidly carried by said doors and intermeshing and operative connection between said doors and said stopping device so that the engagement of said doors by said receptacle actuates said stopping mechanism.

3. In hoists, hoisting mechanism, a device for stopping said hoisting mechanism, a hoisting-receptacle operated by said hoisting mechanism, a pair of swing-doors pivoted at opposite sides of the path of said hoisting-receptacle and normally extending substantially across the same so that the ascension of said receptacle beyond a predetermined point swings said doors upwardly and outwardly, a cone-shaped guide adapted to leave said receptacle into proper engagement with said doors, intermeshing segmental gears rigidly attached to said doors and operative connection between said doors and said stopping device so that the engagement of said doors by said receptacle operates said stopping device.

810,190. URINE. WILLIAM COOPER, Providence, R. I. Filed Mar. 10, 1905. Serial No. 249,592.

Claim.—A union for pipes comprising an exteriorly-threaded male member having an annular, tapered rib on its inner end, a female member having an annular, tapered socket in its inner end and the annular orifice b^4, of even width throughout, extending beyond the bottom of the tapered socket and adapted to permit the metal of the rib to flow, and also having an exterior shoulder on the outer wall of said socket, and a collar interiorly threaded to engage the thread of the male member and having an inwardly-extending flange arranged to engage the exterior shoulder of the female member.

810,191. PICKING-MOTION FOR LOOMS. JOSEPH D. CROWTHER and ALFRED STEER, Huddersfield, England, assignors to Edward Hollingworth, Deberam, England. Filed May 26, 1905. Serial No. 262,112.

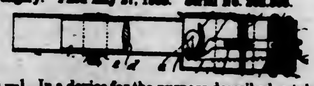


Claim.—1. In a picking-motion of a loom, the combination with a picking-stick, and a pulling-back stick, both connected with the picker, of a connection between said picking-stick, and pulling-back stick, said connection independent of the picker and its connecting-straps.

2. In a picking-motion of a loom, the combination with a picking-stick, and a pulling-back stick, both connected with the picker, of a flexible connection between said picking-stick, and pulling-back stick, said connection independent of the picker and its connecting-straps.

3. In a loom picking-motion of the class described, a picking-stick, and a pulling-back stick, and a connection intermediate said picking-stick and said pulling-back stick, said connection independent of the picker.

810,192. SMALL-ARM. GOTTFRIED DANNER, Przmyel, Austria-Hungary. Filed May 27, 1905. Serial No. 262,553.



Claim.—1. In a device for the purpose described, a tube mounted parallel with the barrel of the weapon, a source of light within said tube, a reflector, a support for said reflector and source of light mounted for movement vertically and horizontally and a convex lens interposed between the reflector and the outer end of the tube, whereby the rays from said source of light are thrown upon the mark by the lens and the image of the light properly placed upon the mark relatively to the line of sight.

2. In a device for the purpose described, a tube mounted parallel with the barrel of the weapon, a lens in the fore part of said tube, a holder adjustable horizontally and vertically in the rear part of said tube, a reflector supported in said holder, and an electric lamp in front of said reflector.

3. In a device for the purpose described, a tube mounted parallel with the barrel of the weapon, a lens in the fore part of said tube, a holder adjustable horizontally and vertically in the rear part of said tube, a reflector supported in said holder, and an electric lamp in front of said reflector and springs bearing in different directions on said holder.

4. In a device for the purpose described, a tube mounted parallel with the barrel of the weapon, a lens in the fore part of said tube, a holder adjustable horizontally and vertically in the rear part of said tube, a reflector supported in said holder, and an electric lamp in front of said reflector, screws disposed at right angles to each other and passed through said holder, and springs surrounding said screws for adjustment of said holder.

810,193. SOAP-MOLDING MACHINE. FELIX DAHL, Hahn, Germany. Filed June 4, 1904. Serial No. 211,857.

Claim.—1. In a machine for effecting the solidification of liquid soap, in molds the combination of a revolving drum with recesses formed at the periphery thereof and constituting molds for the soap, a tank for receiving the liquid soap and supplying it to the molds, a jacket including the tank, partially surrounding the drum, and means for cooling the sides and bottoms of the molds during their revolution, substantially as described.

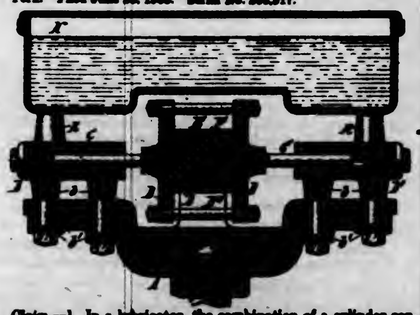
2. In a machine for effecting the solidification of liquid soap in molds the combination of a revolving drum with recesses formed at the periphery thereof and constituting molds for the soap, a tank for receiving the liquid soap and supplying it to the molds as they pass under it, a jacket including the tank, partially surrounding the drum, and means for cooling the sides and bottoms of the molds during their revolution, substantially as described.

3. In a machine for effecting the solidification of liquid soap in molds the combination of a revolving drum with recesses formed at the periphery thereof and constituting molds for the soap, a tank for receiving the liquid soap and supplying it to the molds as they pass under it and cooling devices for the molds applied to the interior and exterior of the drum, substantially as described.

4. In a machine for effecting the solidification of liquid soap in molds the combination of a revolving drum with recesses formed at the periphery thereof and constituting molds for the soap, a tank for receiving the liquid soap and supplying it to the molds, a jacket including the tank, partially surrounding the drum, means for cooling the sides and bottoms of the molds during their revolution, and means for mechanically removing the solidified soap from the machine, substantially as described.

5. In a machine for effecting the solidification of liquid soap in molds the combination of a revolving drum and recesses formed at the periphery thereof and constituting molds for the soap, a tank for receiving the liquid soap and supplying it to the molds as they pass under it, a cooling device for the molds applied to the interior of the drum, and a cooling-jacket arranged around the drum and open at one side for the purpose of removing the solidified soap, substantially as described.

810,194. LUBRICATOR. ERNEST DEHN, Buffalo, N. Y., assignor to Pearl Manufacturing Company, Buffalo, N. Y., a Corporation of New York. Filed June 20, 1905. Serial No. 266,017.



Claim.—1. In a lubricator, the combination of a cylinder containing a piston and having inlet and outlet chambers, valves arranged in said chambers and controlling the passages between the same and the cylinder, springs for closing said valves, and positive opening means for the valves constructed to operate the same alternately, substantially as set forth.

2. In a lubricator, the combination of a cylinder containing a piston and having inlet and outlet chambers connected therewith, valves arranged in said chambers and controlling the passages between the same and the cylinder, springs for closing said valves, and rotary cams arranged to alternately open said valves, substantially as set forth.

3. In a lubricator, the combination of a cylinder containing a piston and having inlet and outlet chambers connected therewith, valves arranged in said chambers and controlling the passages between the same and the cylinder, springs for closing said valves, a rotary shaft extending across the cylinder, cams mounted on said shaft, and thrust-rods interposed between said cams and said valves, substantially as set forth.

4. In a lubricator, the combination of a cylinder containing a piston and having inlet and outlet chambers connected therewith, and each provided in its rear end with a removable plug, valves arranged in said chambers and controlling the passages between the same and the cylinder, springs for closing said valves, and rotary cams arranged to alternately open the valves, substantially as set forth.

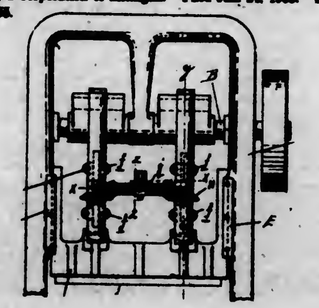
5. In a lubricator, the combination of a pair of opposing cylinders each provided with an inlet and an outlet chamber and inlet and outlet ports connecting each cylinder with its corresponding chambers, check-valves arranged in said chambers and controlling said inlet and outlet ports, pistons arranged in the cylinders, and an actuating-shaft arranged between the cylinders and carrying an eccentric which reciprocates said pistons and cams which operate said valves, substantially as set forth.

6. In a lubricator, the combination of a pair of opposing cylinders each provided on opposite sides with an inlet and an outlet chamber, inlet and outlet ports connecting each cylinder with its corresponding chambers, check-valves arranged in said chambers and controlling said inlet and outlet ports, springs for closing said valves, pistons arranged in said cylinders, and an actuating-shaft arranged between the cylinders and carrying an eccentric which reciprocates said pistons and cams which open said valves, substantially as set forth.

7. In a lubricator, the combination of a pair of opposing cylinders each provided on opposite sides with an inlet and an outlet chamber, corresponding chambers of the cylinders being arranged opposite or in line with each other, inlet and outlet ports connecting each cylinder with its corresponding chambers, check-valves arranged in said chambers and controlling said ports, springs for closing said valves, a shaft arranged transversely between said cylinders and provided in line with said inlet and outlet chambers with oppositely-arranged cams, the one adapted to open the inlet-valves alternately and the other to open the outlet-valves alternately, pistons arranged in said cylinders and means for actuating the pistons, substantially as set forth.

8. In a lubricator, the combination of a pair of opposing cylinders each provided on opposite sides with an inlet and an outlet chamber, inlet and outlet ports connecting each cylinder with its corresponding chambers, check-valves arranged in said chambers and controlling said inlet and outlet ports, springs for closing said valves, pistons arranged in said cylinders, a yoke connecting the pistons, an actuating-shaft arranged transversely between the cylinders and carrying an eccentric which reciprocates said yoke, oppositely-arranged cams mounted on said shaft in line with the check-valves of said inlet and outlet chambers, respectively, and thrust-rods interposed between said cams and said check-valves, substantially as set forth.

810,195. POWER-PRESS. JOHN H. DOMAN, Ypsilanti, Mich., assignor to Michigan Machinery Manufacturing Company, Ypsilanti, Mich., a Corporation of Michigan. Filed Jan. 24, 1905. Serial No. 242,503.



Claim.—1. In a press, the combination with the crank and movable platen, of an adjustable connecting-rod between said crank and platen comprising a plurality of sections, and a threaded shank adjustably connecting said sections, the adjacent ends of said sections forming square shoulders adapted to abut against each other and to be parallel when separated, and a shim or washer for insertion between said shoulders to receive the compression stress and to relieve the stress on the threads of the shank.

2. In a press, the combination with the crank and the movable platen, of a rod connecting said crank and platen, formed in a plurality of sections, a threaded shank of lesser cross-section than said sections of the rod, engaging central threaded apertures therein and forming a means of connecting and adjusting said sections toward or from each other, the adjacent faces of said sections being perpendicular to the axis of said shank and rod to form square shoulders parallel with each other and variable-spacing shims or washers for insertion between said shoulders to receive the compression stress and relieve the same from the threads of said shank.

3. In a press, the combination with the crank-shaft and movable platen, of a plurality of rods connecting the cranks and said platen, each rod comprising a plurality of sections and a central threaded shank adjustably connecting said sctions, a rotary shaft extending between said rods perpendicular thereto and having bearings in the central sections of said rods, bevel gear-wheels connecting said shaft and the threaded shanks of said rods and a ratchet connection to said shaft for rotating the same to simultaneously adjust said shanks and correspondingly lengthen or shorten said rods.

4. In a press, the combination with the crank-shaft and movable platen, of a plurality of rods connecting the cranks and platen, each comprising a plurality of sections having square abutting shoulders and a central threaded shank adjustably connecting said sections, the central sections of said rods projecting laterally toward each other, a shaft perpendicular to said rods journaled in bearings in said extensions of the central members, bevel gear-wheels on said shaft in recesses in said lateral extensions, bevel gear-wheels on said shanks intermeshing with said gear-wheels on said shaft and a ratchet connection to said shaft intermediate said lateral extensions for simultaneously rotating said shanks and correspondingly lengthening or shortening said rods.

5. In a press, the combination with the crank-shaft and movable platen, of a plurality of rods connecting the cranks and said platen, each rod comprising three sections, having square abutting shoulders and a threaded shank of lesser cross-section centrally connecting said sections, the central section of each rod being in a longitudinally-fixed position thereon and being provided with a lateral extension, a shaft perpendicular to said rods journaled in said lateral extensions of the central sections thereof, bevel gear-wheels fixed upon said shanks adjacent to said central sections and having a hub portion formed with square shoulders for abutting against said sections, bevel gear-wheels fixed upon said shaft and located in recesses in said lateral extensions and intermeshing with said bevel gear-wheels on said shanks, the threads on the opposite ends of said shanks being right and left and engaging correspondingly-threaded sockets in the end sections of said rods, said sockets being split and means for clamping said split sockets upon said threaded shanks.

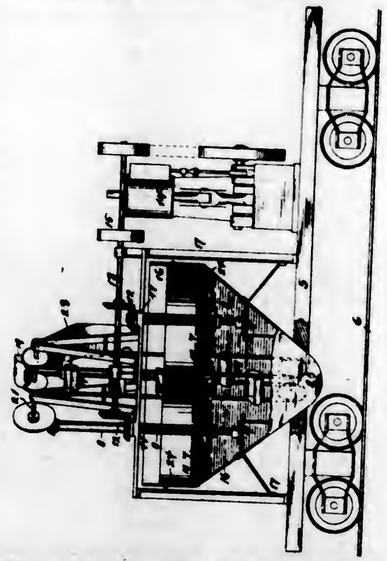
6. In a press, the combination with the crank-shaft and movable platen, of a plurality of rods connecting the cranks and platen, each rod comprising three sections centrally connected by a threaded shank of lesser cross-section, the central section of said rod being sleeved upon said shank in a longitudinally-fixed position thereon and the end sections of said rod having respectively right and left threaded sockets for engaging corresponding threads on said shank, a bevel gear-wheel fixed on said shank adjacent to said central section and having square shoulders abutting thereagainst and against the adjacent end section, a rotary shaft perpendicular to said rods and journaled in bearings in said central sections and bevel gear-wheels on said shaft engaging with said bevel gear-wheels on said shanks, whereby the rotation of said shaft will adjust the end sections of said rods, to be equally spaced from the shoulders of said central section, and gear-wheel.

7. In a press, the combination with the crank-shaft and movable platen, of a rod connecting said crank and the platen formed in three sections, a shank of lesser cross-section centrally connecting said section having a right and left threaded engagement respectively with the end sections and being in longitudinally-fixed relation to said central section, said three sections having square shoulders for abutting with each other and maintaining a full cross-section of the rod at all points therein when said shoulders abut and shims for insertion between said shoulders when separated from each other to receive the compression stress and relieve the same from the threads of said shank.

8. In a press, the combination with the crank-shaft and movable platen, of a plurality of adjustable rods connecting the cranks and said platen, a shaft extending between said rods perpendicular thereto having a geared connection therewith and a ratchet-lever connected with said shaft for rotating the same to simultaneously and correspondingly adjust said rods both above and below said geared connecting-shaft.

9. In a press, the combination with a crank-shaft and movable platen, of a plurality of adjustable rods connecting said platen and the cranks, a shaft extending between said rods perpendicular to and having a gear connection therewith, a ratchet-wheel on said shaft and a ratchet-lever having a reversible pawl, whereby said shaft may be rotated in either direction by said lever to correspondingly and simultaneously adjust said rods both above and below said geared connecting-shaft.

810,196. ORE-WASHING PLANT. FREDERICK BOSSERT, Cincinnati, Ohio. Filed Apr. 6, 1905. Serial No. 254,089.



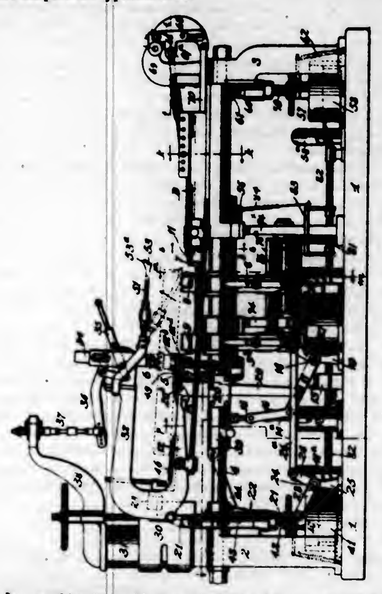
Claim.—1. In an ore-washing plant, the combination of a common water-tank, a group of circular ore-separators arranged therein, means to rotate them and stationary partitions in the upper part of the tank which surround each separator to confine the effect of the operation of the same to the space so surrounded.

2. In an ore-washing plant, the combination of a water-tank terminating below into a central conical pocket, circular ore-separators grouped therein around this pocket and each equidistant therefrom, means to operate them, a bucket elevator arranged in the central space surrounded by these separators and dipping into the pocket below, of the tank, to remove therefrom the waste material and a railway-car upon which all these parts are mounted.

810,197. MACHINE FOR MAKING METAL WHEELS. EMIL REINFELDT, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Filed Oct. 28, 1904. Serial No. 230,228.

Claim.—1. In a machine for making metal wheels the combination with the spoke-fastening means, of a hub-support adapted to sustain the hub on end, and cranked arms projecting laterally from said hub-support and adjustable around their longitudinal axes and adapted to sustain the rim; whereby the rim-support is adjustable vertically with reference to the hub-support.

2. In a machine for making metal wheels and in combination with spoke-fastening means, a flat frame, means for moving said frame bodily relatively to the spoke-fastening means and in the direction of the axis of the hub, an extension on the end of said frame adjustable in the direction of the axis of the spoke and adapted to give support to the hub, and arms extending laterally from said extension and adapted to support the rim.



3. In a machine for making metal wheels, the combination of a support for the hub and rim, movable bodily in the direction of the longitudinal axis of the spoke, mechanism for fastening the inner end of the spoke to the hub, mechanism for fastening the outer end of the spoke to the rim, said latter mechanism comprising a spoke-clamp and a header movable relatively to the clamp toward the hub, and operative connections between said header and the hub and rim-support; whereby when the header advances to perform its functions it will move the hub and rim-support in the direction of the longitudinal axis of the spoke.

4. In a machine for making metal wheels, the combination of a support for the rim adapted to allow the rim to move in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the rim, mechanism for fastening the spoke to the rim, a rest adapted to bear against the outer face of the rim and movable in the direction of the longitudinal axis of the spoke, and connections between the rest and spoke-fastening means, constructed to advance the rest and rim, and maintain the rest in contact with the advancing rim while the spoke is being fastened to the rim.

5. In a machine for making metal wheels, the combination with a support for the rim adapted to allow the rim to move in the direction of the longitudinal axis of the spoke, of means for fixedly sustaining the spoke in relation to the rim to be fastened thereto, a heading device for the outer end of the spoke adapted when advanced to form a head thereon, a rest in position to bear against the outer face of the rim while the head is being formed and movable in the direction of the axis of the spoke, and means controlled by the advance of the heading device for moving said rest relatively to the header and in the direction of the axis of the spoke.

6. In a machine for making metal wheels, the combination with means for sustaining the rim in such manner that it may move bodily in the direction of the axis of the spoke, of means for sustaining the spoke in operative relation thereto, a heading device adapted when advanced to form a head on the outer end of the spoke, means for advancing said heading device, a rest in position to bear on the outer side of the rim adjacent the heading device, and means for moving said rest simultaneously with the heading device, in the direction of the same, but at less speed.

7. In a machine for making metal wheels, the combination of a support for the rim and hub adapted to allow the rim to move in the direction of the axis of the spoke, means for fixedly sustaining the spoke in operative relation to the hub and rim, means for fastening the spoke to the hub, a header adapted when advanced to form a head on the outer end of the spoke, a rest in position to bear against the outer face of the rim while the head is being formed, and means controlled by the movement of the header for moving the rest in the direction of the spoke-axis and relatively to the header in the direction of its heading movement.

8. In a machine for making metal wheels, the combination of a support for the rim and hub movable in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the hub and rim, means for fastening the spoke to the hub, a header adapted when advanced to form a head on the outer end of the spoke, a rest in position to bear against the outer face of the rim, means controlled by the movement of the header for moving the rest in the direction of the spoke-axis, and operative connections between said rest and the supporting device, adapted to move the support in the same direction as that imparted to the rest.

9. In a machine for making metal wheels, the combination of a hub-support adapted to sustain the hub on end and movable transversely of its longitudinal axis, means for supporting the rim in operative relation thereto, means for sustaining the spoke in operative relation to said hub and rim, means for fastening the inner end of the spoke to the hub, a header adapted by its advance to head the outer end of the spoke, a rest in position to bear against the outer face of the rim, and movable in the direction of the axis of the spoke, means for moving said rest, and operative connections between the rest and the hub-support, adapted to move the support in the same direction as that imparted to the rest.

10. In a machine for making metal wheels, the combination with a spoke-clamp adapted to grasp the spoke adjacent the inner face of the rim and formed to permit the spoke to be moved endwise relatively, a supporting device for the hub and rim adapted to hold said parts in operative relation to the spoke and movable in the direction of the axis of the spoke, means for fastening the inner end of the spoke to the hub, a heading device adapted when advanced to upset the outer end of the spoke, a rest in position to bear against the outer face of the rim, means for moving said rest simultaneously with, in the same direction of, but at less speed than the heading device, and means for moving the supporting device simultaneously with and at the same speed of the rest.

11. In a machine for making metal wheels, the combination of a support for the rim, means for sustaining the spoke, a clamp adapted to grasp the spoke near the inner face of the rim, means for moving the spoke and rim relatively to said clamp in the direction of the axis of the spoke, and an abutment independent of the clamp and adapted to bear firmly against the inner face of the rim as the latter approaches the clamp.

12. In a machine for making metal wheels, the combination of means for supporting the rim so that it may be moved in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the same, a heading device adapted by its advance to upset the outer end of the spoke, a rest in position to bear against the outer face of the rim and movable in the direction of the axis of the spoke, and an abutment in position to bear against the inner face of the rim and movable with the rest.

13. In a machine for making metal wheels, the combination with a support for the hub adapted to sustain the same on end, a relatively fixed arm above the support, hub-clamping mechanism sustained by the arm, means for supporting the rim on edge around the hub, an arm mounted on the first-named arm and formed with an abutment to bear against the inner face of the rim, means for sustaining the spoke in operative relation to the rim and hub, and means for fastening the spoke to the rim and hub.

14. In a machine for making metal wheels, the combinaton of means for supporting the rim and spoke in operative relations to be fastened together, mechanism for fastening the spoke to the rim, a sustaining device on which the lower edge of the rim is adapted to rest, and a finger adapted to bear on the upper edge of the rim.

15. In a machine for making metal wheels, the combination with a support for the rim, of means for sustaining the spoke in operative relation to the same, a rest in position to bear against the outer face of the rim, an abutment adapted to bear against the inner face of the rim, a sustaining device on which the lower edge of the rim is adapted to rest, and a finger adapted to bear on the upper edge of the rim.

16. In a machine for making metal wheels, the combination of a rim-support, means for sustaining the spoke in operative relation to the rim, a rest adapted to bear against the outer face of the rim, and a sustaining device on which the lower edge of the rim is adapted to rest, said sustaining device being carried by the rest.

17. In a machine for making metal wheels, the combination of a

hub-support movable in the direction of the axis of the spoke, means for sustaining the rim around the hub, means for holding the spoke in operative relation to said parts, a movable header for the outer end of the spoke, a sliding cap-plate operatively connected with the header, a rim-rest on the cap-plate, and links connecting said cap-plate operatively with the hub-support.

18. In a machine for making metal wheels, the combination with a horizontal vertically-movable hub-holding frame, of a rim-support carried by said frame, an actuating device for moving the frame vertically, vertical bars connected to the frame at one end of the same, vertical links connected with the frame at its other end, and operative connections between the bars and links and the actuating device.

19. In a machine for making metal wheels, the combination with the frame having a vertical standard formed with a vertical open guideway, of a hub-holding frame adapted to be moved in a direction longitudinally of the spoke, and formed with a guide-lug sliding in the guideway, means for moving said frame vertically, means for sustaining the hub and rim in operative relations to the spoke and means for fastening the spoke to the hub and rim.

20. In a machine for making metal wheels, the combination with a horizontal vertically-movable hub-holding frame, of a rim-support carried thereby, an actuating device for moving the frame vertically, and means for adjusting the ends of said frame independently and with relation to the actuating mechanism.

21. In a machine for making metal wheels, the combination of two spoke-clamps adapted to act respectively at opposite ends of the spoke, and each comprising opposing jaws pivoted between their ends on parallel axes and provided on one side of said axes with spoke-grasping surfaces, a longitudinally-extending rocking member formed on opposite sides with cam-surfaces adapted to engage the inner sides of the jaws of both clamps, and adapted to close the jaws on the spoke, an actuating cylinder and piston, and operative connections between the piston and said rocking member; whereby the rocking member serves to operate both clamps in unison.

22. In a machine for making metal wheels, the combination with means for supporting the hub and rim in operative relations, said supporting means being movable in the direction of the axis of the spoke to be secured, of a spoke-clamp adapted to grasp the spoke adjacent the hub and acting to permit a movement of the spoke endwise toward the hub only, a second spoke-clamp adapted to grasp the spoke adjacent the rim and acting to permit the spoke to be moved endwise, a heading device for the hub end of the spoke adapted to upset the spoke within the hub and against the holding action of the first-named clamp, a heading device for the opposite end of the spoke adapted when advanced toward the hub to upset the end of the spoke outside the rim, means controlled by the advance of this header for moving the rim and connected spoke and hub in the direction of the axis of the spoke and with relation to the clamp, and means for forming a shoulder on the spoke at the inner face of the rim when the spoke is moved endwise.

23. In a machine for making metal wheels, the combination of a support for the hub and rim movable vertically and horizontally, a cylinder 13, a piston therein operatively connected with said support, spoke-clamps, a cylinder 79, a piston therein operatively connected with said clamps, a hub-header, a cylinder 41, a piston therein operatively connected with the hub-header, a rim-header, a cylinder 56, a piston therein operatively connected with the rim-header, valves for the respective cylinders controlling the admission to and exit of fluid under pressure from the same, a common operating means for said controlling-valves, and connections between said operating means and the respective valves, said valves and connections being so formed and related that when the common operating means is actuated, cylinder 13 will be first opened to the exhaust, then pressure admitted to cylinder 79, then this cylinder opened to the exhaust, then pressure admitted to cylinder 56 and this cylinder opened to the exhaust, then cylinder 79 opened to the exhaust, and finally pressure admitted to cylinder 13.

810,198. METHOD OF MAKING METAL WHEELS. BERT. BUSHNELL, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Original application filed Oct. 20, 1904, Serial No. 229,332. Divided and this application filed Mar. 13, 1905. Renewed Dec. 8, 1905. Serial No. 290,609.

Claim.—1. The method of making metal wheels in which the spokes are secured to the hub in two ranks, which method consists in fastening all the spokes of one rank to the members of the wheel and then fastening the spokes of the other rank while hot, the rim being closed at any time prior to the fastening of the second rank.

2. The method of making metal wheels in which the spokes are secured to the hub in two ranks, which method consists in fastening together the hub, rim and spokes of one rank in such relations that the hub will occupy a position in a longitudinal direction beyond that it will occupy in the completed wheel, then fastening all the spokes of the other rank to the hub and closed rim while said spokes are hot; whereby the contraction of the spokes from cooling will draw the hub to the proper position and will place all the spokes under tension.

3. The method of making metal wheels in which the spokes are fastened to the hub in two rows or ranks, which consists in providing a hub with two rows of holes therearound, and a rim with holes spaced therearound at intervals, fastening all the spokes of one rank in place with their inner ends in the holes of one rank in the hub and their outer ends in every alternate hole in the rim, then fastening all the spokes of the other rank in place while hot with their inner ends in the holes of the second rank in the hub and their outer ends in the holes in the rim, the rim being closed at any time prior to the fastening of the second rank.

4. The method of making staggered wheels, which consists in fastening one rank of spokes to the hub and rim while the spokes are hot, allowing the secured spokes to contract, and then fastening the spokes of the other rank while hot, to the members of the wheel, the rim being closed at any time prior to the fastening of the second rank.

5. The method of making staggered wheels, which consists in providing a hub with two series of holes therearound, a closed rim, and spokes, fastening all the spokes of one rank to the hub and rim respectively, and then securing the spokes of the other rank while hot to the hub and rim.

810,199. VEHICLE-STEP. JOSEPH BERRY, Cleveland, Ohio. Filed May 15, 1905. Serial No. 260,630.

Claim.—The combination of a step-shank having an upwardly-recessed arch-shaped head, adapted to span the upper portion of an axle, and a separate clip extending through the recess and embracing said head and axle and arranged to secure the step-shank in place on a support.

810,200. RAILWAY-TIE. ELI T. FORRESTER, Hot Springs, S. D. Filed Oct. 17, 1903. Serial No. 177,163.

Claim.—1. A railway-tie made up of a series of alternating metallic and fibrous layers with metal layers at the top and bottom of the tie, and binding elements piercing the layers of the tie.

2. A railway-tie made up of a series of alternating metallic and fibrous layers with metal layers at the top and bottom of the tie, binding elements piercing the tie, each end portion of the tie being provided with a pair of spaced vertical openings, and track-fastening elements for said openings and provided with non-circular heads fitted in similarly-shaped seats in the bottom metallic layer of the tie.

3. A railway-tie pierced by a vertical opening, a bolt extending through the opening with its head at the under side of the tie, and a flanged rail-engaging element fitted to the upper end of the bolt to overlap the base of the rail and provided with a hub portion entering the opening in the tie.

4. A railway-tie pierced by a vertical opening having enlarged non-circular top and bottom portions constituting seats, a bolt extending through the opening with its head snugly fitted in the lower seat, and a flanged rail-engaging element fitted to the top of the bolt with its flange adapted to overhang and engage the base of the rail and provided with a hub portion entering the seat at the top of the opening in the tie.

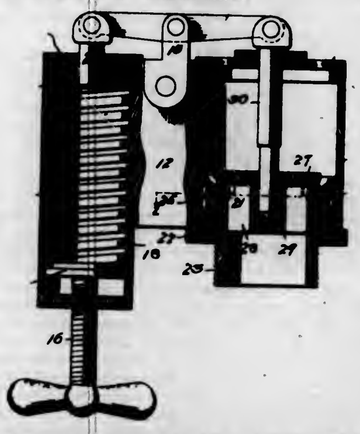
5. A railway-tie made up of a series of alternating metallic and fibrous layers with metallic layers at the top and bottom of the tie, said tie being pierced by a vertical opening which is enlarged in the top metallic layer and also enlarged in the bottom metallic layer, a bolt passing through the opening with its head seated in the lower enlargement of the opening, and a flanged rail-engaging element fitted to the upper end of the bolt with its flange adapted to overhang and engage the base of the rail and provided with a hub portion entering the enlarged upper end of the opening in the tie.

6. A track-fastener comprising a bolt which is non-circular adjacent its threaded terminal, a rail-engaging element having a non-circular opening receiving the non-circular portion of the bolt, said element being provided with a series of substantially radial rail-engaging flanges which are successively provided upon their under faces with rail-engaging shoulders located at progressively-increasing distances from the bolt-opening, and a nut to hold the rail-engaging element upon the bolt.

7. The combination with a railway-tie having a bolt-opening therein which is enlarged at its upper end to form a non-circular seat, of a bolt extending through the opening and rising above the tie, a rail-engaging element fitted upon the bolt and having its lower side provided with a non-circular boss fitting the non-circular seat of the tie, said rail-engaging element having a series of substantially radial rail-engaging flanges which are successively provided upon their under sides with rail-engaging shoulders located at progressively-increasing distances from the bolt-opening, and means to hold the rail-engaging element upon the bolt.

8. As a new article of manufacture, a track-fastening element comprising a body pierced by a bolt-opening, the bottom of the body having a non-circular boss concentric with the bolt-opening, a concentric series of substantially radial rail-engaging flanges, and shoulders upon the under sides of the flanges and located at progressively-increasing distances from the bolt-opening.

810,201. POP SAFETY-VALVE. JORDAN W. GRANT, Portsmouth, Va. Filed June 8, 1905. Serial No. 264,232.



Claim.—A pop safety-valve, comprising a pair of integral parallel cylinders having a connecting-web and one constituting a valve-chamber and the other a spring-casing, a valve-seat secured within the lower portion of the chamber, a valve arranged on said seat, a perforated cap arranged at the top of the casing and removable therefrom for repair or renewal of the valve, a loose valve-stem guided in a central opening in the cap and entering a centrally-disposed recess in the valve, a compression-spring arranged in the casing, upper and lower disks at the ends of the spring, a stem extending from the upper disk, a pivot-ing carried by the web, a lever pivoted thereto and connected to said two stems, and an adjusting-screw passing through a threaded opening at the bottom of the casing and bearing on said lower disk.

810,202. TYPE-WRITING MACHINE. JOHN A. HASSINGTON, New York, N. Y. Filed Mar. 10, 1905. Serial No. 249,870.

Claim.—1. In type-writting machines, a pair of independent bearings, independent guide-supports and adjusting devices for each bearing, and a type-bar having an arched lower extremity, and foot members extending in opposite directions from and at an angle to the terminals of said arched extremity, each foot member having an independent pivotal connection with one of said bearings.

2. In type-writing machines, a pair of bearings, guide-supports, adjusting devices for the same, and a type-bar having a lower arched member and foot members extending horizontally in opposite directions from the ends of the arched member, which foot members are pivoted in said bearings.

3. In type-writing machines, a support, bearing-plates in pairs located on said support, adjusting devices for the bearing-plate, a type-bar having an arched lower member radially disposed with reference to the support, horizontal oppositely-disposed foot members extending from the ends of the arched member, toe extensions from the foot members, and pivotal connections between the bearing-plates and the toe extensions of the type-bar.

4. In type-writing machines, a supporting-plate, bearing-posts and pins carried by the supporting-plate and arranged in transverse rows, bearing-plates in pairs located upon the supporting-plate, said bearing-plates having semicircular offsets for engagement with the bearing-posts, their inner ends being upwardly curved beyond the inner edge of the supporting-plate, the outer ends of said bearing-plates having engagement with said pins, said bearing-plates being also provided with projections from one side face and with conical offsets at their curved inner ends, and type-bars having arched lower members radially disposed to the supporting-plate, and oppositely-extending horizontal foot members at the ends of the arched members, each foot member having a toe extension provided with a depression to receive the offsets from the inner ends of the bearing-plates, and adjusting-screws engaging with the projections on the bearing-plates as described.

810,203. WARDROBE-TRUNK. THOMAS J. HAMILTON, New York, N. Y. Filed June 17, 1905. Serial No. 265,696.

Claim.—1. In a wardrobe-trunk, the combination of a slide, bars adapted to support garments carried by said slide, and guides adapted to support said bars and relieve said slide of strain, substantially as described.

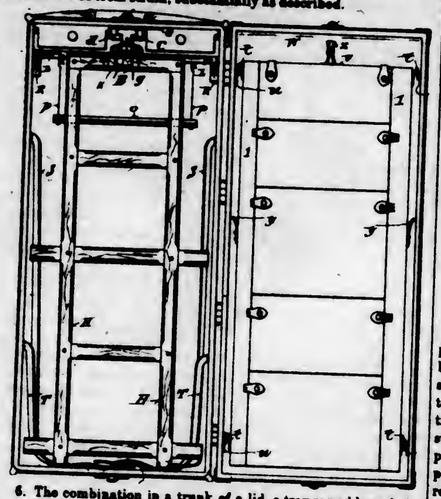
2. In a wardrobe-trunk, the combination of a slide, bars adapted to support garments carried by said slide and guides fixed to the trunk and adapted to support the ends of said bars and relieve said slide of strain, substantially as described.

3. In a wardrobe-trunk, the combination of a slide, bars adapted to support garment-hangers carried by said slide, and guides fixed to the trunk and adapted to support opposite ends of said bars and relieve said slide of strain, substantially as described.

4. In a wardrobe-trunk, the combination of a slide, clips movable thereon, bars supported by said clips and adapted to sustain garment-hangers, and parallel guides fixed to the trunk and adapted to support opposite ends of said bars and relieve said slide of strain, substantially as described.

5. In a wardrobe-trunk, the combination of a slide, clips movable thereon, transverse bars supported by said clips and adapted to

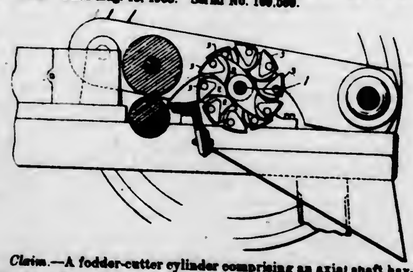
support garment-hangers, a follower movable on said slide, means to hold said follower against the garments, and guides fixed to the trunk and adapted to support the ends of said transverse bars and relieve said slide from strain, substantially as described.



6. The combination in a trunk of a lid, a tray movable endwise therein, hooks and eyes for detachably connecting said tray with said lid, and a catch adapted to normally hold said tray against displacement, substantially as described.

7. The combination in a trunk, of a lid, a tray movable endwise therein, and devices for removably attaching said tray to said lid, substantially as described.

810,204. **FODDER-CUTTER.** FRANK G. HARRISON and ALBERT C. JACOBY, Massillon, Ohio, assignors to Williamson R. Harrison, Massillon, Ohio. Filed Aug. 15, 1903. Serial No. 169,599.

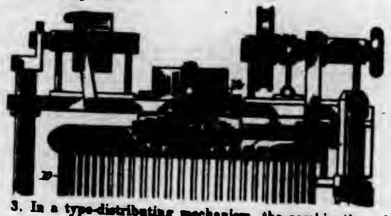


Claim.—A fodder-cutter cylinder comprising an axial shaft having a stop-collar with radial arms fixed thereon, a series of diametrically-disposed and spirally-arranged pairs of knife-arms with side shoulders mounted on the shaft, there being apertures for the shaft on the inner ends of the knife-arms and cutting-blades on the outer ends thereof and the inner parts of the knife-arms being halved to bring the arms of each pair in the same plane, and the side shoulders of the several knife-arms abutting respectively against the radial arms and the edges of the adjoining knife-arms, and a lock-collar set on the shaft against the last pair of knife-arms.

810,205. **TYPE-DISTRIBUTING MECHANISM.** HARRY C. HEMMIS, Chicago, Ill. Filed Aug. 24, 1905. Serial No. 275,095.

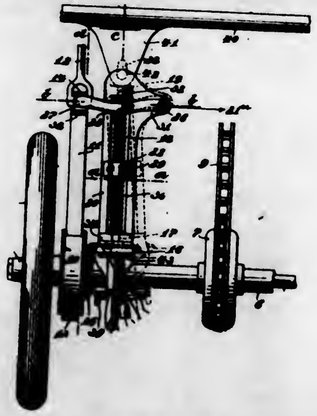
Claim.—1. In a type-distributing mechanism, the combination of two pocketed sections, one of which is movable relatively to the other to successively register its pockets with the pockets of the other section, and a means for giving said movable section a step-by-step movement, said movement being composed of relatively long or primary steps advancing the pockets of the movable section into registry or approximate registry, and each long or primary step being followed by a relatively short or secondary step to insure the registry of the pockets.

2. In a type-distributing mechanism, the combination of two pocketed sections, one of which is movable relatively to the other to bring its pockets successively into registry with the pockets of the second section, and a cam coacting with the movable section serving to impart thereto a step-by-step movement, the cam having a relatively long or primary step followed by a relatively short or secondary step, and the long or primary step of the cam serving to move the pockets of the movable section into approximate registry with the pockets of the other section, and the short or secondary step insuring registry of the pockets.



3. In a type-distributing mechanism, the combination of two pocketed sections, one of which is movable relatively to the other to bring its pockets successively into registry with the pockets of the second section, and a cam coacting with the movable section serving to impart thereto a step-by-step movement, the cam having a relatively long or primary step followed by a relatively short or secondary step, and the long or primary step of the cam serving to move the pockets of the movable section into approximate registry with the pockets of the other section, and the short or secondary step insuring registry of the pockets, and the cam having its said steps separated by a straight portion causing an interval between the said movements of the movable section.

810,206. **LOCKING DEVICE FOR MOTOR-CARS, AUTOMOBILES, AND THE LIKE.** ISAAC W. HETHERINGTON, Philadelphia, Pa. Filed Aug. 21, 1905. Serial No. 275,066.



Claim.—1. In a wheeled vehicle, a locking device consisting of the combination of two operative units, the first unit secured permanently to the wheel or axle upon which said vehicle travels, and adapted, when properly connected with the second of said units, to communicate motion to an operative part thereof, and the second unit, detachably connected with said first unit, and adapted to be disconnected therefrom, said second unit provided with a primary moving part adapted to be directly moved by the movement of said first unit, in combination with a more slowly-moving secondary element connected therewith, and adapted to be moved along a definite line of travel, together with a fixed abutment against which said secondary element shall, after an interval, be arrested, and thereby arrest the movement of the primary moving part of said second unit, and of the connected first unit, and so arrest the travel of said vehicle, substantially as described.

2. In combination with the driving wheel and axle of a motor-car, or the like, provided with means for communicating motion to a second and detachable unit, said second unit consisting of a primary part adapted to be directly moved by the rotation of said wheel, and a secondary part and an abutment, said secondary part receiving a slower motion from said primary part, and operating a separately-moved part toward said abutment, provided therefor, by which the movement of said more slowly-moving part shall, after a considerable number of rotations of said wheel, be arrested, and so limit the travel of, and arrest the rotation of the wheel of said motor-car, substantially as described.

3. A locking device for motor-cars, and the like, consisting of a detachable frame carrying an elongated screw-threaded rod, and means for communicating rotary motion thereto, a screw-threaded block adapted thereto, and moved by the rotation thereof, and suitable fixed journals in said frame for the longitudinal bearings of said rod, and an abutment on said frame against which said block will impinge when its limit of travel has been reached, together with a toothed wheel secured to said screw-rod, and a corresponding toothed wheel on the wheel or axle of said motor-car, said frame adapted to be locked in place, with said toothed wheels meshed into each other, or moved apart so that said toothed wheels shall be disconnected from each other, substantially as described.

4. As an article of manufacture a detachable locking device for motor-cars and the like, consisting of a frame carrying a toothed gear-wheel and a longitudinal screw-rod secured thereto and extending along said frame, a screw-nut engaged with the threads of said screw-rod, means for preventing the rotation of said nut, a journaled bearing at each end for said screw-rod, a handle for moving the free end of said frame laterally, a pivot-bearing for the opposite end of said frame to connect the same with a fixed part of said car, and a toothed gear-wheel secured to one of the driving-wheels of said motor-car, and adapted to be detachably connected with, or disconnected from the said toothed wheel of said frame, the whole constructed to operate substantially as and for the purposes herein shown and described.

5. A freeway locking device for motor-cars, and the like, adapted to permit the said car to be moved a definite distance upon its running-gear, without interference, and to then arrest the further movement of said running-gear, consisting of a toothed wheel around the axle of one of the driving-wheels of said car, a pivoted frame laterally movable at one end, and having its free end provided with a toothed wheel adapted to gear in with said opposite toothed wheel on said axle, or be moved out of contact by moving said frame laterally away, and means for locking said frame either in or out of gear, said frame provided with an elongated screw-rod secured to and rotating with said toothed wheel of said frame, a nut made to be screwed along said rod, and prevented by suitable means from rotation thereupon, abutments for said nut at the ends of said rod, together with a pressure device, adapted to gradually retard the rotation of said rod and said toothed wheels, and the wheels of said motor-cars, said device interposed between said nut and an end of said rod, and adapted to operate by gradually increasing the pressure directly, or indirectly upon said car-wheel, substantially as, and for the purposes described.

6. A locking device for wheeled vehicles, consisting of a toothed bevel-wheel surrounding the axle and rigidly rotated with said vehicle-wheel, a frame pivotally secured to a fixed portion of said vehicle, and extending along to the axle thereof, said frame provided with a toothed bevel-wheel at its axle end adapted to be detachably meshed into the toothed bevel-wheel of said vehicle-wheel, a screw-threaded rod secured to said bevel-wheel on said frame, a screw-nut threaded on said rod, and protected against rotation thereupon, an abutment for said nut at the end of said rod, a handle for laterally moving said frame, in and out of gear with said bevel-wheel on said vehicle-wheel, and an independently-movable part interposed between said nut and said abutment at one of the ends of said rod, said movable part adapted to be struck by the advance of said nut, and said movable part operatively connected with the brake mechanism, so as to cause the brake to be gradually compressed against a brake-cylinder attached to said vehicle-wheel, substantially as described.

7. A locking device for motor-cars, and the like consisting of a detachable frame, movably secured to a fixed part of said car, and adapted to be moved to or fro along the driving-wheel axle of said car, said frame provided with a longitudinal screw-threaded rod, a toothed wheel rigidly connected therewith, a nut adapted to be screwed along said rod, and means for preventing the rotation of said nut, an abutment for said nut on said frame, an independently-movable part on said frame operated by the advance of said nut along said rod, said movable part constructed to operate a brake device on said car, together with a toothed wheel rigidly connected with a driving-wheel of said car, said frame adapted to be moved in one direction so as to put the two toothed wheels in gear with each other, or to be moved in an opposite direction so as to disconnect them, together with means for securely locking said frame in place with its gear connection either open or closed, substantially as described.

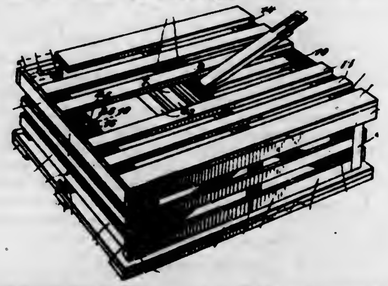
8. In combination with a motor-car, its driving wheel and axle, and means for propelling said car, a toothed gear-wheel upon said wheel and axle, a pivoted and laterally-movable frame, having its free end contiguous to said driving wheel and axle, a toothed gear-wheel on said frame adapted to be detachably connected with the toothed gear-wheel of said driving wheel and axle, a screw-rod secured to the gear-wheel of said frame, a nut on said rod, means for preventing rotation of said nut, an abutment for said nut at the end of said rod, a guide-opening in said frame at its free end constructed to accommodate the axle of said car within the same said frame, adapted to be moved and guided at its free end along said axle, and means for locking said frame with a gear connection between said toothed wheels, or locking them apart when separated from each other, together with a handle for operating said frame substantially as described.

9. A locking device for wheeled vehicles consisting of a laterally-movable frame carrying a gear-wheel, a screw-rod secured thereto, a screw-nut on said rod, means for preventing rotation of said nut, an abutment at the end of said rod, an independently-moving part along said rod, adapted to be engaged and forced along by the advance of said nut, an operative connection between said moving part, and a friction-brake on said vehicle, together with a gear-wheel secured to the wheel of said vehicle, said frame detachably connected with, or disconnected from making a gear connection with said vehicle-wheel, together with means for locking the gear-wheel of said frame to the gear-wheel of said vehicle-wheel, substantially as described.

10. In a locking device for wheeled vehicles consisting of a gear-wheel secured to one of the supporting-wheels thereof, a detachable frame with slow-motion mechanism, an abutment for the same, and a gear-wheel adapted to be detachably connected with the gear-wheel of said vehicle-wheel, together with means for locking said gear-wheels together, or apart, a supplementary device for moving said slow-motion mechanism into any desired position along said frame while said gear-wheels are disconnected from each other, substantially as and for the purpose set forth.

11. In combination with a vehicle-wheel supporting a toothed gear-wheel, a detachable frame supporting a gear-wheel adapted thereto, a screw-rod secured to said latter, a nut on said rod, means for preventing rotation of said nut, and an abutment for said nut at the ends of said rod, a supplemental nut-setting gear, and a handle adapted to operate the same, the whole so constructed, that when said frame is detached from said vehicle-wheel, said rod may be independently rotated by said supplemental gear and handle, and said nut screwed along said rod to any required position thereupon, substantially as described.

810,207. **POULTRY-COOP.** WILLIAM H. HODGES, Union Star, Mo. Filed Dec. 19, 1904. Serial No. 237,582.



Claim.—1. In a knockdown coop or crate the combination of the bottom, ends and sides constructed to fold over said bottom, said sides and ends being so arranged that when they are in an upright position the sides are between the ends and support said ends in said upright position, a top for said coop or crate, a transverse brace on said top, said brace being constructed to engage said sides to hold the same in an upright position, substantially as described.

2. In a knockdown coop or crate, the combination of a bottom, folding ends and sides thereon, a top for said coop or crate, means on

the upper edge of said ends for holding the said top in position when said coop is in an upright position, and means carried on the side of said ends for engaging said top to hold the same in position when said coop is in a knocked-down or collapsed position, said engaging means on the side of said ends being brought into position for engaging said top when said ends are folded, substantially as described.

3. In a folding coop or crate, the combination of a bottom, end and side pieces thereon, a turn-button on the upper edge of said end pieces, a turn-button on the side of said end pieces, a cover or top adapted to be passed over said end and side pieces and adapted to be engaged by said turn-button on the upper edge of said end pieces when the coop is in an upright and open position, said top or cover being also adapted to be engaged by the turn-button on the side of said end pieces when the coop is in a folded or collapsed position, said turn-button on the side of said ends being brought into position to engage the said top when said sides are folded down substantially as described and for the purposes set forth.

810,208. RAIL-JOINT. WILLIAM M. HORNER and BENJAMIN F. LAMBE, Columbus, Ohio, assignors of one-third to William A. Horner, Steubenville, Ohio. Filed Sept. 21, 1905. Serial No. 279,490.

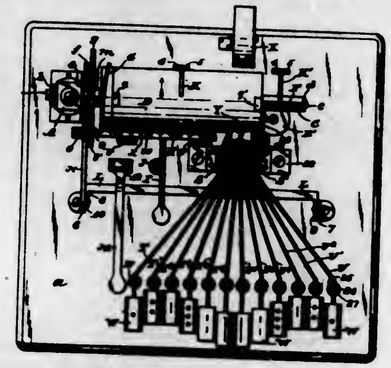
Claim.—1. In a rail-joint, the combination with two rails having openings formed therein adjacent to their ends, of a base-plate having openings formed therein, a flange carried by the one side of said base-plate and having slots formed therein, fish-bars adapted to embrace the web portions of said rails, said fish-bars having transversely-disposed openings formed therein adapted to aline with the openings of said rails, a headed plate adapted to extend through one of said openings, headed pins adapted to extend through the other of said openings, spikes passing through the ends of said pins and said plate, depending resilient strips carried by said spikes and adapted to lock said spikes in engagement with said pins and said plate, means to secure said rails to said base-plate, substantially as described.

2. In a rail-joint, the combination with rails, having openings formed therein, adjacent their ends, of a base-plate, fish-bars adapted to embrace the web portions of said rails, said fish-bars having openings formed therein adapted to aline with the openings of said rails, pins passing through some of said openings, a plate passing through the other of said openings, spikes adapted to pass through the ends of said pins and said plate, means carried by the upper ends of the spikes and engaging the pins and plate, respectively, to secure said spikes in said pins and said plate, and means to lock said rails in engagement with said base-plate, substantially as described.

3. In a rail-joint, the combination with rails having openings formed therein adjacent to their ends, of a base-plate, fish-bars adapted to embrace the web portions of said rails, pins passing through said fish-bars and said rails, a plate passing through said fish-bars and said rails, separate and independent means carried by the plate and by each of the pins respectively to lock said plate and said pins within said fish-bars, means to lock the last-named means in said pins and in said plate, and means to lock said rails in engagement with said base-plate, substantially as described.

810,209. STENOGRAPHIC TYPE-WRITING MACHINE. CHARLES R. KING, Indianapolis, Ind. Filed July 22, 1904. Serial No. 217,625.

Claim.—1. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a platen supported by means of the axle so as to move rotatively and also longitudinally, a plurality of type-bars coöperating with the platen, paper-holding clips carried by the platen, a rack-bar mounted on the base and spring-pressed toward the platen, a device attached to the platen for coöperation with the rack-bar, a latch mounted on the base, a lever connected with the rack-bar for the control thereof and in coöperation with the latch, and mechanism coöperating with the platen for the rotation thereof and adapted to be operated by the simultaneous operations of all of the plurality of type-bars.



2. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a platen mounted on the axle so as to rotate and also move longitudinally, means for rotating the platen, a plurality of type-bars coöperating with the platen, a rack-bar mounted on the base, an actuating device carried by the platen for coöperation with the rack-bar, a spool mounted on the base to hold a paper ribbon, a presser-roll supported by the base and coöperating with the platen to hold the ribbon thereto, means for holding the rack-bar out of contact with the actuating device, and a stop mounted on the base adapted to prevent the longitudinal movement of the platen.

3. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a platen mounted on the axle so as to rotate and also move longitudinally, means for rotating the platen, a plurality of type-bars coöperating with the platen, a rack-bar mounted on the base, an actuating device carried by the platen for coöperation with the rack-bar, a spool mounted on the base for holding a paper ribbon, a presser-roll supported by the base and coöperating with the platen to hold the ribbon thereto, means for holding the rack-bar out of contact with the actuating device, a stop mounted on the base adapted to prevent the longitudinal movement of the platen, and a knife supported in proximity to the presser-roll.

4. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secued to the pillar, a sleeve mounted rotatively on the axle and provided with a ratchet-wheel, a platen mounted on the sleeve so as to move longitudinally thereon, and also to rotate therewith, a plurality of type-bars coöperating with the platen, a rack-bar supported by the base and spring-pressed toward the platen, an actuating device carried by the platen for coöperation with the rack-bar, a latch supported by the base, a lever connected with the rack-bar and coöperating with the latch, and means coöperating with the ratchet-wheel and the type-bars adapted to rotate the sleeve and the platen.

5. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a sleeve mounted rotatively on the axle and provided with a ratchet-wheel and also a gear-wheel, a platen mounted on the sleeve so as to move longitudinally thereon and also to rotate therewith, a plurality of type-bars coöperating with the platen, means coöperating with the ratchet-wheel and the type-bars adapted to rotate the platen and the sleeve, a pair of spools mounted on the base, an ink-ribbon wound on the spools, a rotative shaft mounted on the base and having a pinion engaging the gear-wheel, operating means connecting the shaft with one of the spools, a rack-bar supported by the base, and a device attached to the platen for coöperation with the rack-bar serving to move the platen longitudinally on the sleeve.

6. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a sleeve mounted rotatively on the axle and provided with a gear-wheel, a platen mounted on the sleeve so as to move longitudinally thereon and also to rotate therewith, a plurality of type-bars coöperating with the platen, a rocking bar provided with a spacing-lever and adapted to be operated by the type-bars, means coöperating with the rocking bar and the platen to rotate the platen, a spring-pressed arm mounted on the base provided with a controlling-lever and supporting a rack-bar, a latch mounted on the base and engaging the controlling-lever, an actuating device carried by the platen and coöperating with the rack-bar, a pair of spools mounted on the base, an ink-ribbon wound on the spools, and means coöperating with the gear-wheel and the spools to operate the ribbon.

7. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a sleeve mounted rotatively on the axle and provided with a ratchet-wheel, a platen mounted on the sleeve so as to move longitudinally thereon and also to rotate therewith, a plurality of type-bars coöperating with the platen, a rack-bar mounted movably on the base, a latch mounted on the base, a controlling-lever connected with the rack-bar and coöperating with the latch, an actuating device carried by the platen adapted to coöperate with the rack-bar, a rocking bar extending in proximity to parts of the type-bars so as to be operated thereby and provided with a movable arm, a rod connected to the movable arm of the rocking bar and provided with a catch coöperating with the ratchet-wheel, and a spacing-lever coöperating with the rocking bar.

8. A stenographic type-writing machine including a base, a pillar supported on the base, an axle secured to the pillar, a sleeve mounted rotatively on the axle, a platen mounted on the sleeve, a stand mounted on the base, a pivot supported by the stand, a plurality of type-bars mounted on the pivot and provided collectively with two identical sets of printing characters, one set of the characters being adapted to form or indicate the initial sounds of words, syllables or phrases and the other set the terminal sounds thereof, the characters consisting of dots and dashes, and mechanism coöperating with the sleeve and also with the type-bars to rotate the platen.

9. In a stenographic type-writing machine, the combination with a fixedly-supported pillar, of an axle having one end thereof adjustably attached to the pillar and provided with a collar at the opposite end thereof, a sleeve mounted rotatively on the axle between the pillar and the collar and provided with a feather at the outer side thereof, a platen having a hub provided with a slot receiving the feather of the sleeve, a cushion-collar on the sleeve with which the inner end of the platen-hub may have contact, a plurality of type-bars coöperating with the platen, a ratchet-wheel secured to the sleeve, mechanism coöperating with the ratchet-wheel for rotating the sleeve and the platen, a movable rack-bar, an actuating device carried by the platen coöperating with the rack-bar for moving the platen longitudinally on the sleeve, and a controlling-lever for the rack-bar connected therewith.

10. In a stenographic type-writing machine, the combination with a plurality of movable type-bars having operating-levers, of a fixedly-supported axle, a sleeve mounted rotatively on the axle and provided with a ratchet-wheel, a platen mounted on the sleeve so as to move longitudinally thereon and also to rotate therewith in proximity to the type-bars, a rocking bar extending in proximity to the operating-levers of the type-bars so as to be operated thereby and provided with an arm, a rod pivoted to the arm of the rocking bar and having a catch coöperating with the ratchet-wheel, and means for operating the rocking bar independently of the operating-levers of the type-bars.

11. In a stenographic type-writing machine, the combination of a base, a pillar mounted on the base, an axle secured to the pillar, a platen supported by means of the axle so as to move rotatively and also longitudinally, a plurality of type-bars coöperating with the platen, means for moving the platen rotatively and also longitudinally, a rocking bar journaled in the platen and having arms provided with clips coöperating with the platen, a spring coöperating to draw the clips against the platen, and a lever mounted on the platen and connected with the rocking bar for the operation of the clips.

12. In a stenographic type-writing machine, the combination of a base, a pillar mounted on the base, an axle secured to the pillar, a platen supported by means of the axle so as to move rotatively and also longitudinally, a plurality of type-bars coöperating with the platen, means for moving the platen rotatively and also longitudinally, paper-holding clips carried by the platen, and a spring-arm mounted on the base coöperating with the platen and provided with outwardly-extending lips for guiding the arm.

810,210. ARTICLE OF CHEWING-GUM. BENJAMIN A. LAWS, Pittsburg, Pa. Filed May 10, 1905. Serial No. 259,861.

Claim.—1. As a new article of manufacture, a piece of chewing-gum having a base of gum insoluble in water, said piece having a cavity therein charged with a liquid or semiliquid substance, the interior of the cavity being lined with a moisture-resisting material; substantially as described.

[redacted]

2. As a new article of manufacture, a piece of chewing-gum having a base of gum insoluble in water, said piece having a cavity therein charged with a liquid or semiliquid substance, the interior of the cavity being lined with a fatty matter; substantially as described.

810,211. SHEET-METAL CAN. ISAAC J. MARQUIS, Richmond, Va., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed July 19, 1905. Serial No. 270,260.

Claim.—1. A tobacco or other can having a top or upper head furnished with a screw-threaded neck, provided with an inwardly-projecting flange at its upper edge, and a screw-cap having a segmental pouring-opening therein, and a rotary segmental closing-plate inside and pivoted to said screw-cap and fitting between and guided and supported by the screw-cap on the outside and said inturned flange of said screw-neck of the can-top on the inside, said rotary closing-plate having an integral lip fitting outside and engaging the marginal portion of the screw-cap adjacent to said opening therein, substantially as specified.

2. In a can, the combination with a top or upper head having a screw-neck provided with an inturned flange at its upper edge, of a screw-cap having a segmental opening therein, and a rotary closing-plate fitting inside the cap, and guided and supported at its outer circular portion by the inturned flange on said screw-neck, substantially as specified.

3. In a can, the combination with a top or upper head having a screw-neck provided with an inturned flange at its upper edge, of a screw-cap having a segmental opening therein, and a rotary closing-plate fitting inside the cap, and guided and supported at its outer circular portion by the inturned flange on said screw-neck, said closing-plate having an integral lip fitting outside and engaging the marginal rim portion of the screw-cap, substantially as specified.

4. In a can, the combination with a top or upper head having a screw-neck provided with an inturned flange at its upper edge, of a screw-cap having a segmental opening therein, and a rotary closing-plate fitting inside the cap and guided and supported at its outer circular portion by the inturned flange on said screw-neck, said closing-plate having an integral lip fitting outside and engaging the marginal rim portion of the screw-cap, said rotary closing-plate having also a projection for engagement of the nail to turn the same, substantially as specified.

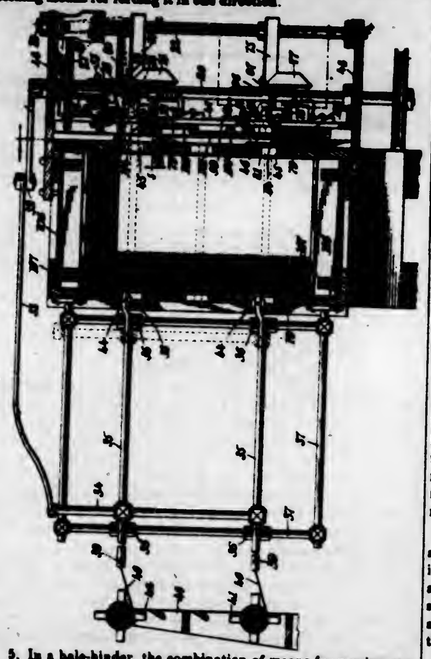
810,212. BALE BINDER AND TIER. WILLIAM C. MORGANS and THOMAS GILLOON, Dubuque, Iowa. Filed Nov. 23, 1904. Serial No. 234,264.

Claim.—1. A bale-binder having a gripping device comprising a pair of jaws, one of said jaws being pivotally mounted and having resilient means for forcing it in one direction.

2. A bale-binder having a gripping device, comprising a pair of jaws, one of said jaws being stationary and the other being pivoted, a curved bar formed on the arc of a circle, with the point at which the second jaw is pivoted as a center, and a spring surrounding said bar and guided thereby, said spring being adapted to force the pivoted jaw into position opposite the stationary jaw.

3. In a bale-binder, the combination of a frame, means for moving material along the frame, a gripping device located at one side of the frame, and a needle for holding wire and advancing it across the frame to the gripping device; said gripping device comprising a pair of jaws, one of said jaws being pivoted and having means for forcing it toward the other.

4. In a bale-binder, the combination of a frame, means for moving the material thereacross, a gripping device for securing the end of the wire in front of the material, and a needle for holding the wire and advancing it across the material, said needle comprising a tube through which the wire passes; said gripping device comprising a pair of jaws, one of said jaws being pivotally mounted and having holding means for forcing it in one direction.



5. In a bale-binder, the combination of means for moving material to be formed into a bale, a gripping device for receiving the end of a wire and holding it in front of the material, means for advancing a wire across the space through which the material passes, into contact with the first-mentioned wire, means for twisting the wires together, said last-named means comprising a rotary shaft and a projection on the shaft having a slot for the wires, means for rotating said shaft comprising gearing connected therewith, and means for automatically stopping said shaft; comprising an inclined plane mounted upon the gearing, a roller adapted to be moved by said inclined plane, and a clutch connected with said roller.

6. In a bale-binder, the combination of means for moving material to be formed into a bale, a gripping device for receiving the end of a wire and holding it in front of the material, means for advancing a wire across the space through which the material passes, into contact with the first-mentioned wire, means for twisting the wires together; said last-named means comprising a rotary shaft and a projection on the shaft having a slot for the wires; a guide-plate located adjacent to said twisting means and adapted to receive the wires, and means for forcing the wire-advancing means toward the gripping device.

7. In a bale-binder, the combination of means for moving material to be formed into a bale, a gripping device for receiving the end of a wire and holding it in front of the material, means for advancing a wire across the space through which the material passes, into contact with the first-mentioned wire, means for twisting the wires together; said last-named means comprising a rotary shaft and a projection on the shaft having a slot for the wires; and a guide-plate located adjacent to said twisting means and adapted to receive the wires, said plate having a V-shaped opening to guide the wires into it, a slot at the bottom of said opening, and a bar extending across said slot.

8. In a bale-binder, the combination of means for twisting wires together, comprising a rotary shaft and a projection on the shaft having a slot for the wires and a guide-plate located adjacent to said twisting means and adapted to receive the wires, said plate having a V-shaped opening to guide the wires into it, a slot at the bottom of said opening, and a bar extending across said slot.

9. A bale-binder having a gripping device, a twisting device and a guide-plate located adjacent to said twisting device, said plate having a V-shaped opening located in front of the twisting device, a slot at the apex of said opening and extending therefrom, said slot being of sufficient width to allow the passage of a single wire but to prevent the passage of two wires twisted together, an opening at the end of the slot for permitting the passage of twisted wires, and a bar across the opening to prevent the wires from passing through it at certain times.

10. A bale-binder, comprising means for twisting wires together, said means having a rotary shaft and a projection on the shaft having a slot for the wires, means for rotating said shaft comprising gearing connected therewith, and means for automatically stopping said shaft, comprising an inclined plane mounted upon the gearing, a roller adapted to be moved by said inclined plane, and a clutch connected with said roller.

11. A bale-binder, comprising means for twisting a plurality of wires together and consisting of a rotary shaft, and a projection extending at right angles to the shaft and having a slot for receiving the wires, said slot being closed at its end and open at one side.

12. In a binder, the combination of means for moving material adapted to be formed into a bale, means for securing the end of a wire in front of the material, a needle for holding the wire and advancing it across the material, said needle comprising a tube through which the wire passes, and a cutter located adjacent to said securing means, for shearing the wire; said cutter comprising a pivoted blade and means for operating said blade comprising a link and a lever.

13. In a binder, the combination of means for moving material adapted to be formed into a bale, means for securing the end of a wire in front of the material, a needle for holding the wire and advancing it across the material, said needle comprising a tube through which the wire passes, and a cutter located adjacent to said securing means, for shearing the wire; said cutter comprising a pivoted blade, automatic means for oscillating said blade upon its pivot, and automatic means for throwing said oscillating means out of gear.

14. In a binder, the combination of means for moving material adapted to be formed into a bale, means for securing the end of a wire in front of the advancing material, a needle for holding the wire and advancing it across the material, and a cutter located adjacent to said securing means for shearing the wire; said cutter comprising a movable blade, means for moving the blade, and automatic means for throwing the moving means out of gear.

15. The combination of a main shaft, a second shaft, connections between said shafts for transmitting motion from one to the other, a clutch between said connections and the main shaft, means for automatically throwing said clutch out of operative position, a needle for wire, connections between the main shaft and said needle for reciprocating the needle, a plunger, connections between the main shaft and the plunger for operating the latter, a clutch for disengaging said connections from the plunger, and automatic means for operating said clutch.

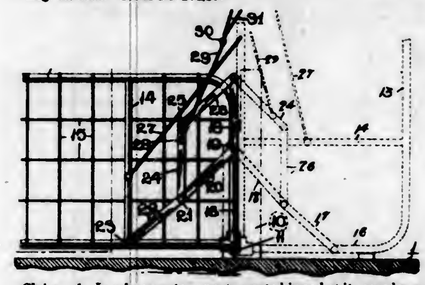
16. The combination of a main shaft, a second shaft, a clutch on said main shaft whereby a portion thereof may be thrown out of engagement with the remainder, connections between said main shaft at a point beyond the clutch and the second shaft, a clutch member in the said second shaft, means for throwing said last-named clutch member, a gear on said second shaft, a cam-surface on the gear, means for causing said cam-surface to automatically throw said last-named clutch out of operative position, a shaft operatively connected with said gear, and a twisting device mounted on said last-named shaft.

17. In a bale-binder, the combination of a main shaft, a needle, means connected with the main shaft for intermittently forcing the needle across the binder, a bar having a projection located in the path of the material to be moved through the machine, a reciprocating bar having a catch adapted to be engaged by said first-named bar, whereby the motion of the first-named bar caused by the advancing material will reciprocate the second bar, and means connected with the second bar for disconnecting the main shaft from the needle.

18. In a bale-binder, the combination of a shaft, a needle, an arm connected with the needle, a clutch between the shaft and the arm, a plate for operating said clutch, a reciprocable bar having means for engaging said plate, and holding the clutch in disconnected position, and means for manipulating said bar when a bale is forced from the machine.

19. In a bale-binder, the combination of a main shaft, a needle, means connected with the main shaft for reciprocating the needle, a gripping device located in the path of the needle, a pivoted plate, means for holding said pivoted plate in such position as to force the needle toward the gripping device when the needle passes said plate in one direction, and yielding means for permitting the plate to move out of position when the needle passes in the other direction.

810,213. FARM-GATE. JACOB A. MYERS, St. Louis, Mo. Filed Aug. 14, 1905. Serial No. 274,177.



Claim.—1. In a farm-gate, a post, a gate hinged at its rear lower corner to said post, a double post on each side of the rear end of the gate, pivoted levers operating between said double post, connections between the inner ends of the levers and the gate, locking-links pivotally secured to the first-mentioned post, and to the gate, and flexible connections from the outer ends of the levers to the locking-links; substantially as specified.

2. In a farm-gate, a post, a gate hinged at its rear lower corner to said post, a double post positioned on each side of the rear end of the gate, pivoted levers operating between said double posts, rods connecting the inner ends of said levers to the gate, two sets of locking-links pivotally held together and arranged between the first-mentioned post and the gate so as to hold said gate locked in either open or closed position, and cables extending from the outer ends of the levers to the locking-links; substantially as specified.

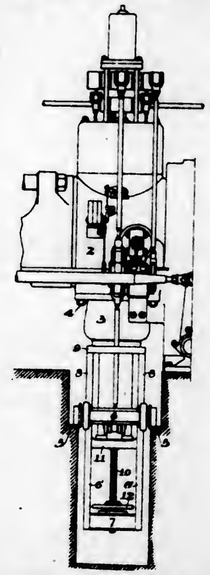
810,214. CHECKREIN ATTACHMENT. JAMES A. MCCOMBS, Port Chester, N. Y. Filed Jan. 2, 1904. Serial No. 187,586.

Claim.—1. A checkrein attachment designed to connect a checkrein with the saddle-hook of a harness, comprising a strap having three holes formed therein longitudinally thereof and two of which are adjacent to the opposite ends thereof and the other intermediate of said ends, and a ring or link device through which one of the ends of the strap is passed and folded so that the hole therein will register with the intermediate hole in the strap, said end portion of the strap and the intermediate portion of the strap being secured together, the saddle-hook being adapted to be passed through the hole in the other end of the strap and through the said registering holes, substantially as shown and described.

2. A checkrein attachment designed to connect a checkrein with the saddle-hook of a harness, comprising a strap having three holes formed therein longitudinally thereof and two of which are adjacent to the opposite ends thereof and the other intermediate of said ends, and a ring or link device through which one of the ends of the strap is passed and folded so that the hole therein will register with the intermediate hole in the strap, said end portion of the strap and the intermediate portion of the strap being secured together, and the saddle-hook being adapted to be passed through the hole in the other end of the strap and through the said registering holes, and said last-named end of the strap being adapted to be bent at an angle to the intermediate portion thereof, substantially as shown and described.

3. A checkrein attachment adapted to be connected with a checkrein and to connect the checkrein with the saddle-hook of a harness, comprising a ring or link device, a strap one end of which is passed through said ring or link device and folded over and secured to the intermediate portion thereof, the folded end portion of the strap and the intermediate portion being provided withholes which register, and the opposite end portion of the strap being also provided with a hole, said last-named end portion being bent at an angle to the intermediate portion in connecting the attachment to the saddle-hook, and the saddle-hook being passed through the hole in said last-named end portion and through the holes in the first-named end portion and intermediate portion, substantially as shown and described.

810,215. VALVE-REMOVING APPARATUS. MARVIN A. NEELAND, Youngstown, Ohio. Filed Oct. 19, 1904. Serial No. 229,099.



Claim.—1. A support mounted in a space below the valve-casing underneath an engine-cylinder, and movable vertically and sidewise in said space; substantially as described.

2. A vertically-movable support mounted in a space below the valve-casing underneath an engine-cylinder, and a sidewise-movable car on said support; substantially as described.

3. In an engine installation, a pit extending below the valve-casing underneath an engine-cylinder, said pit extending to one side of the engine, and mechanism arranged to lower the valve-seat within the pit and move it therein to one side of the engine; substantially as described.

4. In an engine installation having a valve-casing underneath an engine-cylinder, a pit underneath the valve and extending to one side of the engine, a car movable upon a track within said pit, and a vertical adjustable support upon the car arranged to register with the valve-seat in one position of the car; substantially as described.

5. In an engine installation having a valve-casing underneath an engine-cylinder, a pit underneath the valve extending to one side of the engine, a car movable within said pit, a vertically-movable support on the car, and screw mechanism for raising and lowering the said support; substantially as described.

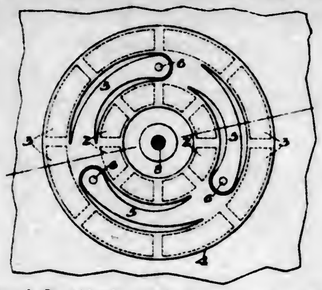
6. In an engine installation having a valve-casing underneath an engine-cylinder, a pit beneath the valve extending to one side of the engine, a car movable within the pit and having vertically-extending guides, a vertical-movable frame within the guides, and hand-controlled screw mechanism for raising and lowering the support; substantially as described.

7. A valve-removing device comprising a horizontally-moving car having a vertically-moving frame arranged to be brought into position beneath a valve-case; substantially as described.

8. A vertically-movable support capable of being brought into position under the underneath valve-casing of a cylinder, said support being also capable of lateral movement from beneath said casing; substantially as described.

9. A U-shaped horizontally-movable car having a vertically-movable support with a U-shaped top member arranged to be brought into position beneath a valve-casing of a cylinder; substantially as described.

810,216. VALVE FOR BLOWING-ENGINES, &c. MARVIN A. NEELAND, Youngstown, Ohio. Filed Oct. 19, 1904. Serial No. 229,100.



Claim.—1. In a blowing-engine or compressor, a thin sheet-metal valve having a tapered spring integral therewith; substantially as described.

2. In a blowing-engine or compressor, a thin sheet-metal valve having spring-strips out of registry with the air-ports, said strips being tapered; substantially as described.

3. In a blowing-engine or compressor, a thin sheet-metal plate with integral springs cut therefrom, the end of each spring being secured to the cylinder-head, and the spring being tapered from each end toward its central portion; substantially as described.

4. A blowing-engine or compressor having a valve comprising a thin sheet-metal plate having strip springs cut therefrom and free at one end, and a back-stop having ports in registry with the springs; substantially as described.

5. In a blowing-engine or compressor, an air-valve consisting of parallel strips of thin sheet metal united at intervals, with tapered springs between and integral with said strips, and a back-stop arranged to limit the lift of the valve and permit passage of air past each edge; substantially as described.

6. In a blowing-engine or compressor, a thin sheet-metal valve having integral strips cut therefrom with their free ends secured to the plate containing valve-ports, and arranged to normally draw the valve to its seat; substantially as described.

810,217. LUNA FOR HOLDING THE HOST. HERMAN F. NEER, New York, N. Y. Filed Aug. 25, 1905. Serial No. 275,849.

Claim.—1. In a luna, a stationary front member having a crystal therein, a rear hinged back member constructed mainly of metal but provided with a centrally-located crystal, the inner face of the said rear member being dished except at its margin, which is straight and a locking device for the hinged member of the luna.

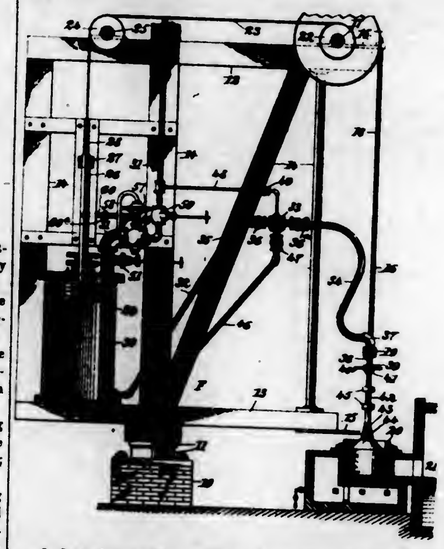
2. In a luna, a fixed member having its front composed almost entirely of crystal and provided with an inner locking-band for the crystal the inner edge whereof is inclined downwardly and inwardly to an engagement with the inner face of the crystal, a rear hinged member adapted to be received within the front member, the said rear member being made principally of metal and being provided with a crystal at its central portion, the inner face of the said rear member being dished except at its margin which is straight, and a locking device for said rear member.

3. In a luna, a fixed front and a hinged rear member, each member being provided with a crystal, the rear member having a button extending outwardly from its rear face, a slide with which both members of the luna are connected, a spring-latch having hinged connection with the said slide, the said latch comprising a locking member having a spoon-shaped upper end adapted to receive the head of the said button, and a rearwardly-extending handle member for the purposes described.

810,218. GLASS-WORKING MACHINE. JOSEPH NORTH, Lancaster, Ohio. Filed Apr. 27, 1904. Serial No. 205,073.

Claim.—1. In a glass-working machine, the combination with a drawing-tool provided with a passage, of a movable member connected with the drawing-tool and serving to force a fluid through the passage.

2. In a glass-working machine, the combination with a drawing-tool provided with a passage, of a movable member connected with the drawing-tool and serving to force a fluid through the passage, and means for applying power to the movable member.



3. In a glass-working machine, the combination with a drawing-tool provided with a passage, of a movable member connected with the drawing-tool and serving to force a fluid through the passage, means for applying power to the movable member, and means for controlling the application of power.

4. In a glass-working machine, the combination with a drawing-tool provided with a passage, of a movable member connected with the drawing-tool and serving to force a fluid through the passage, means for applying power to the movable member, and automatic means for controlling the application of power.

5. In a glass-working machine, the combination with a drawing-tool provided with a passage, of a movable member connected with the drawing-tool and serving to force a fluid through the passage, means for applying power to the movable member, and means movable with the member for controlling the application of power.

6. A glass-working machine comprising a movable drawing-tool provided with a passage, and means for applying fluid-pressure both through the passage and to effect the movement of the tool.

7. A glass-working machine comprising a movable drawing-tool provided with a passage, means for applying fluid-pressure both through the passage and to effect the movement of the tool, and means for producing at least a partial vacuum in said passage.

8. In a glass-working machine, the combination with a drawing-tool, of a power-cylinder and its piston, said piston being connected with the drawing-tool, and means for controlling the application of power to the cylinder operable through the movement of the drawing-tool.

9. In a glass-working machine, the combination with a drawing-tool, of a power-cylinder and its piston, said piston being connected with the drawing-tool, a valve controlling the application of power to the cylinder, and automatic means for operating the valve

10. In a glass-working machine, the combination with a drawing-tool, of a power-cylinder and its piston, said piston being connected with the drawing-tool, a valve controlling the application of power to the cylinder, a variable weight connected with the valve, and means for shifting the weight through the movement of the drawing-tool.

11. The combination with a drawing-tool, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder, a valve in the pipe, a variable weight connected with the valve-spindle, and connections between the weight and drawing-tool.

12. The combination with a drawing-tool, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder, a valve in the pipe, and a diaphragm connected with the valve and under the influence of the pressure.

13. The combination with a drawing-tool, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder, a valve in the pipe, a diaphragm connected with the valve and under the influence of the pressure, a lever connected with the valve and diaphragm, and a movable weight associated with the lever.

14. The combination with a drawing-tool provided with a passage, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder at one side of the piston, and a pipe connected with the cylinder at the opposite side of the piston and with the tool-passage.

15. The combination with a drawing-tool provided with a passage, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder at one side of the piston, a pipe connected with the cylinder at the opposite side of the piston and with the tool-passage, and a valve in each of the pipes.

16. The combination with a drawing-tool provided with a passage, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder at one side of the piston, a pipe connected with the cylinder at the opposite side of the piston and with the tool-passage, and an automatic controlling-valve in the delivery-pipe.

17. The combination with a drawing-tool provided with a passage, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder at one side of the piston, a pipe connected with the cylinder at the opposite side of the piston and with the tool-passage, and a pipe joining the delivery-pipe and drawing-tool pipe.

18. The combination with a drawing-tool provided with a passage, of a piston connected therewith, a cylinder in which the piston operates, a pipe for delivering fluid-pressure to the cylinder at one side of the piston, a pipe connected with the cylinder at the opposite side of the piston and with the tool-passage, and means for producing at least a partial vacuum in the drawing-tool pipe.

19. The combination with a support, of a cable passing over the support, a drawing-tool provided with a passage connected with the cable at one side of the support, a cylinder, a piston operating in the cylinder and connected with the cable at the other side of the support, and a communication between the cylinder and the tool-passage.

20. The combination with a support, of a cable passing over the support, a drawing-tool connected with the cable at one side of the support, a cylinder, a piston operating in the cylinder and connected with the cable at the other side of the support, a pipe for delivering fluid-pressure to the cylinder, a valve in the pipe, and a chain connected with the valve-spindle and movable with the cable

21. In a glass-working machine, the combination with a rotatable frame, of means for supplying pressure extending axially of the frame, and a drawing-tool carried by the frame and operable through said pressure.

22. In a glass-working machine, the combination with a rotatable frame, of a drawing-tool and a power-cylinder carried by the frame, and connections between the cylinder and the drawing-tool.

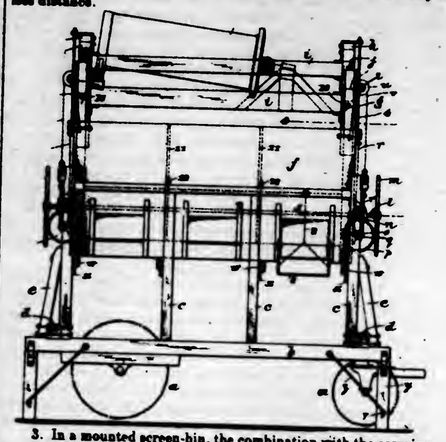
23. In a glass-working machine, the combination with a rotatable frame, of a drawing-tool and a power-cylinder carried by the frame, connections between the cylinder and the drawing-tool, and a supply-pipe for the cylinder extending axially of the frame.

24. In a glass-working machine, the combination with a pipe for supplying a fluid under pressure, a union member rotatable upon one end of the pipe and provided with a hand-wheel, and a drawing-tool having the companion member of the union connected with the supply-pipe.

810,219. MOUNTED SCREEN-BIN. EDWIN S. PHILIPS, Kennett Square, Pa., assignor to The American Road Machine Company, Kennett Square, Pa., a Corporation of Pennsylvania. Filed Aug. 15, 1905. Serial No. 274,204.

Claim.—1. In a mounted screen-bin, the combination, with the carrying-frame, of a bin-frame and a screen-frame, each movable vertically with relation to each other and the carrying-frame, and means for simultaneously raising or lowering the bin-frame and screen-frame.

2. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame and means to move the screen-frame vertically a determinate distance relatively to the carrying-frame and simultaneously therewith the bin-frame vertically a less distance.



3. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame movable vertically in guides in the carrying-frame, a screen-frame movable vertically in guides in the bin-frame, and means for simultaneously moving the bin-frame and screen-frame vertically at different speeds relatively to the carrying-frame.

4. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, a shaft extending longitudinally of the bin-frame and supported thereon, a hand-wheel at each end thereof, and connections from the shaft to both the bin-frame and the screen-frame for elevating or lowering them simultaneously.

5. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, cross-shafts one at each end of, and supported on, the bin-frame, means to turn said shafts and connections from the shafts to both the bin-frame and the screen-frame for elevating or lowering them simultaneously.

6. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, pulleys supported on the bin-frame, chains one end of each connected to the screen-frame and the other end to the carrying-frame and between its ends engaging its corresponding pulley, and means to raise or lower the bin-frame, thereby, through the said chains and pulleys, simultaneously raising or lowering the screen-frame relatively to the bin-frame.

7. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, pulleys supported on the bin-frame, chains one end of each connected to the screen-frame and the other end to the carrying-frame and between its ends engaging its corresponding pulley, other chains secured at one end to the carrying-frame, cross-shafts turning in bearings on the bin-frame, pulleys on the cross-shafts engaging the last-named chains respectively, and means to turn said shafts.

8. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame, each movable vertically with relation to each other and the carrying-frame, chains connected to the screen-frame, pulleys supported on the bin-frame and engaged by the respective chains, other chains connected to the screen-frame, other pulleys supported on the bin-frame and engaged by the last-named chain respectively, and means to turn the last-named pulleys.

9. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, chains connected at one end to the screen-frame and at the other end to the carrying-frame, pulleys on the bin-frame about which the respective chains extend, other chains connected at one end to the screen-frame and at the other end to the carrying-frame, other pulleys on the bin-frame about which the last-named chains respectively extend, and means to turn the last-named pulleys.

10. In a mounted screen-bin, the combination with the carrying frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, chains connected

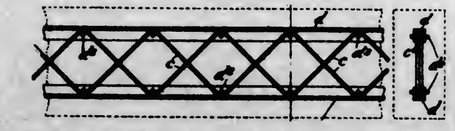
to the screen-frame, pulleys supported on the bin-frame and engaged by the respective chain, other chains connected to the screen-frame, other pulleys supported on the bin-frame and engaged by the last-named chains respectively, shafts to which the last-named pulleys are secured, a worm-wheel secured to each shaft, a driving-shaft, and a worm on the driving-shaft engaging each worm-wheel.

11. In a mounted screen-bin, the combination with the carrying frame, of a bin-frame and a screen-frame each movable vertically with relation to each other and the carrying-frame, chains connected at one end to the screen-frame and at the other to the carrying-frame, pulleys on the bin-frame about which said chains respectively extend, other chains connected at one end to the screen-frame and at the other end to the carrying-frame, other pulleys on the bin-frame about which the last-named chains respectively extend, a shaft, a hand-wheel thereon, worms on the shaft, worm-wheels driven by the worms, and shafts to which the worm-wheels and last-named pulleys are secured.

12. In a mounted bin, the combination with the screen-frame, the upright posts of the carrying-frame having guides, the upright posts of the bin-frame vertically movable in said guides and having guides in which the screen-frame is vertically movable, raising mechanism for simultaneously lifting the bin-frame on the guiding-posts of the carrying-frame and the screen-frame on the guiding-posts of the bin-frame, a support engaging the carrying-frame and bin-frame for holding the latter in its elevated position, and a support engaging the bin-frame and screen-frame for holding the latter in its elevated position, thereby relieving the strain on the raising mechanism.

13. In a mounted screen-bin, the combination with the carrying-frame, of a bin-frame telescoping within the carrying-frame, a screen-frame telescoping within the bin-frame, a shaft extending lengthwise of the bin-frame and extending beyond the ends thereof, and turning in bearings thereon, hand-wheels one at each end of the shaft, worms on the shaft one near each hand-wheel, worm-wheels one engaging each worm, a shaft at each end of the bin-frame and extending crosswise thereof and turning in bearings thereon, a worm-wheel on each cross-shaft engaging the corresponding worm, two pulleys on each cross-shaft, rods, one secured to each corner of the screen-frame, chains, each secured at one end to its corresponding rod and at the other end to the carrying-frame and between its ends engaging its corresponding pulley, a second cross-shaft at each end of the bin-frame, two pulleys thereon, and chains, each secured at one end to the screen-frame and at the other end to the carrying-frame and between its ends engaging the corresponding pulley.

810,220. REINFORCING DEVICE FOR CONCRETE STRUCTURES. ARTHUR S. PENNOCK, Morristown, N. J. Filed Mar. 17, 1905. Serial No. 250,571.



Claim.—1. A device of the class described, comprising parallel side bars and connecting-rods arranged diagonally between said bars and crossing each other at regular intervals centrally and longitudinally between said bars, said connecting-rods being connected with said bars so as to prevent their outward and inward movement, and said connecting-rods being continuous, substantially as shown and described.

2. A reinforcing device for use in concrete and similar structures, comprising parallel side bars and connecting-rods arranged diagonally between said bars and crossing each other at regular intervals centrally and longitudinally between said bars, said connecting-rods being connected with said bars so as to prevent their outward and inward movement, and said connecting-rods being continuous, and said bars being provided with attaching devices around which said rods are passed, substantially as shown and described.

3. A reinforcing device for use in concrete structures, said device comprising parallel bars having holes punched therethrough at regular intervals, and continuous connecting-rods arranged diagonally between said bars and crossing each other in opposite directions and formed into loops which pass through said holes and through which hoy-pins are passed on the outer sides of said bars, substantially as shown and described.

4. A reinforcing device for use in concrete structures, comprising parallel side bars, and connecting-rods arranged between said bars and extending longitudinally thereof and arranged diagonally and crossing each other at regular intervals longitudinally and centrally of the space between said bars, said bars being provided with holes through which said connecting-rods are passed, substantially as shown and described.

810,221. TENSION OR REINFORCING DEVICE FOR USE IN CONCRETE STRUCTURES. ARTHUR S. PENNOCK, Morristown, N. J. Filed May 10, 1905. Serial No. 259,668.

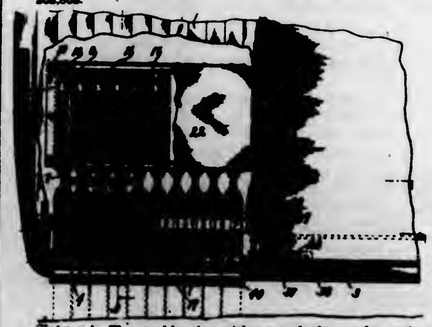
Claim.—1. A tension or reinforcing device of the class described, comprising a bar and continuous rods bent at regular intervals to form oppositely-directed loops or elbows, said rods being placed together side by side so that the side portions of the loops or elbows cross each other, and the loops or elbows which project in the same direction being secured to said bar, substantially as shown and described.

2. A tension or reinforcing device of the class described, comprising a channel-bar and continuous rods bent at regular intervals to form loops or elbows, said rods being placed together side by side so that the side portions of said loops or elbows cross each other and the loops or elbows which extend in the same direction being secured in said bar, substantially as shown and described.

3. A tension or reinforcing device of the class described, comprising a channel-bar and continuous rods bent at regular intervals to form loops or elbows, said rods being placed together side by side so that the side portions of said loops or elbows cross each other and the loops or elbows which extend in the same direction being secured in said bar by means of pins passed through the side walls thereof and through said loops or elbows, substantially as shown and described.

4. A tension or reinforcing device of the class described, comprising a bar and a plurality of continuous rods bent at regular intervals to form oppositely-directed loops or elbows, said rods being placed side by side so that the side portions of the loops or elbows cross each other and the loops or elbows which project in the same direction being permanently secured to said bar, substantially as shown and described.

810,222. VEHICLE-PLATFORM. WINFRED R. REYNOLDS and WILLIAM F. GROSAU, New York, N. Y. Filed Mar. 30, 1905. Serial No. 253,203.



Claim.—1. The combination with a car-platform, of a sectional auxiliary platform secured underneath the car-platform and means for extending the several sections laterally from the car-platform.

2. The combination with a car-platform, of a sectional auxiliary platform secured underneath the car-platform and means for extending the several sections laterally from the car independently of one another.

3. The combination with a vehicle, of a platform mounted to slide laterally from the side of the vehicle in a horizontal plane and means for operating the platform.

4. The combination with a vehicle, of a platform mounted to slide laterally from the side of the vehicle in a horizontal plane and means for automatically operating the platform.

5. The combination with a vehicle, of a platform mounted to slide in a horizontal plane beyond the side of the vehicle, means for operating the platform and means under the control of a door opening to the platform for controlling the operation of the platform-operating means.

6. The combination with a vehicle, of a sectional platform mounted to move into an extended position at the exterior of the vehicle and means for operating the said sections independently of one another.

7. The combination with the stationary platform of a car, of an auxiliary platform mounted to slide outwardly and inwardly from and toward the stationary platform and means for applying compressed fluid to move the auxiliary platform.

8. The combination with a car, of a platform composed of several sliding sections, cylinders, one for each section, pistons working in the cylinders and connected with the sections and means for admitting compressed fluid to the cylinders to operate the pistons.

9. The combination with a car provided with a door, of a sliding platform, means for applying a compressed fluid to operate the sliding platform and a valve actuated by the door for controlling the action of the compressed fluid on the sliding platform.

10. The combination with a car, of a platform composed of sliding sections, a cylinder and piston for each sliding section, means for operating the sliding sections in one direction by compressed fluid and springs for operating the sections in the opposite direction.

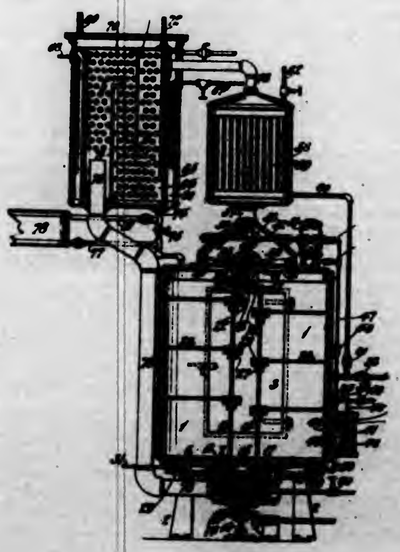
11. The combination with a car, of a platform composed of sliding sections, a cylinder and piston for each section, means for simultaneously operating the sliding sections in one direction and means for operating the sections in the opposite direction independently of one another.

12. The combination with a car, of a platform composed of sliding sections, springs for forcing the sections outwardly into operative position, means for forcing the sections inwardly against the tension of the springs and means for locking the sections in their inward adjustments.

13. The combination with a car, of a platform having a sliding movement out and in at the exterior of the car, means for placing the platform under the action of compressed fluid to operate it, and a differential valve for controlling the admission and discharge of the compressed fluid.

14. The combination with a suitable support, of a platform comprising several sections in juxtaposition in a plane and means for sliding the several sections independently beyond the margin of the support.

810,223. APPARATUS FOR DEGREASING SUBSTANCES. HENRY ROESEN, Philadelphia, Pa., assignor to Emanuel Printz, Philadelphia, Pa. Filed Jan. 5, 1905. Serial No. 239,723.



Claim.—In a device of the character described, an operating-tank adapted to be filled with decreasing material, supports for the material to be treated therein, a condenser, conduit leading from the top and bottom of the tank to said condenser, and a propeller above said supports adapted to rotate in two directions, whereby the air or vapor in said tank is removed therefrom by drawing the same through the upper conduit, while the substances are in part submerged by the material that is in the tank and forcing the air or vapor through the lower conduit, after all the material has been withdrawn or changed into vapor.

810,224. GAME APPARATUS. FRANK L. SACKETT, Fredonia, N. Y. Filed Apr. 8, 1901. Serial No. 54,896.

Claim.—1. A game-board having a playing-field, comprising a friction-surface and a relatively smaller smooth horizontal playing-surface substantially flush with the friction-surface and constituting an integral portion of said game-board and having a goal therein.

2. A game-board having a playing-field, comprising a friction-surface and a relatively smaller smooth surface upon which the game-piece is adapted to rest and be glided, said smooth surface being substantially flush with said friction-surface and having a goal therein.

3. A game-board having a playing-field comprising a friction-surface and a relatively smaller smooth surface, said latter surface having a single goal substantially in the center thereof and presenting a flat substantially horizontal unobstructed surface from said goal to the friction-surface, said flat surface being of considerably greater area than the goal whereby the game-piece may rest and be glided thereon.

4. A game-board having a playing-field comprising a friction-surface B, a smooth surface H, and a smooth horizontal playing-surface C substantially flush with said friction-surface and having a single goal located substantially centrally thereof.

5. A game-board having a playing-field comprising a friction-surface B, a smooth surface H and a smooth horizontal playing-surface C substantially flush with said friction-surface and having a single goal located substantially centrally thereof and projections located on said friction-surface.

6. A game-board having a playing-field, comprising a friction-surface and a relatively smaller smooth horizontal surface substantially flush with the friction-surface and constituting an integral portion of said game-board and having a goal therein, and side portions projecting above said playing-field, said side portions comprising a series of independent depressible sections.

7. A game-board having a playing-field, comprising a friction-surface and a relatively smaller smooth horizontal surface substantially flush with the friction-surface and constituting an integral portion of said game-board and having a goal therein, and side portions comprising a series of independent depressible sections and means for holding said sections normally in an elevated position.

810,225. PRINTING AND FOLDING MACHINE. WALTER SCOTT, Plainfield, N. J. Filed Feb. 19, 1897. Serial No. 624,268.

Claim.—1. The combination of a rotating carrier provided with a plurality of non-rotating folding-blades, rotating cams for protruding said folding-blades, and mechanism for rotating said cams and said carrier in different times, substantially as described.

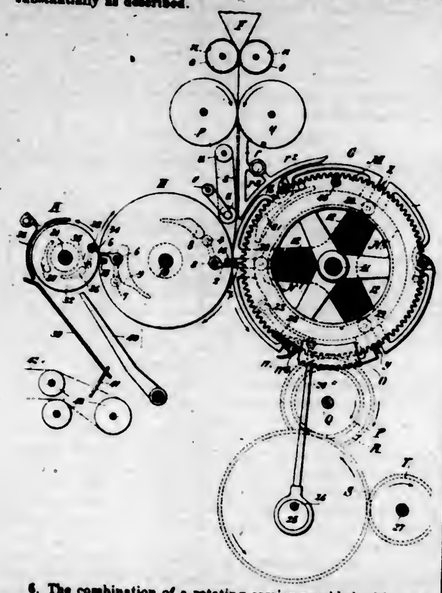
2. The combination of a rotating carrier, a non-rotating folding-blade movable radially thereof, a rotating cam, and connection between said cam and said blade having a part coacting with and revolving about the same axis as said cam but in a different time, substantially as described.

3. The combination of a rotating carrier, a plurality of folding-blades movable radially thereof, a rotating cam, and an independent connection between said cam and each of said blades having a part coacting with and rotating about the same axis as but at a rate of speed different from that of said cam, substantially as described.

4. The combination of a rotating carrier, an in-and-out movable non-rotating folding-blade thereon, and a cam revolving about the same axis as but independently of said carrier and at a different rate of speed and connected with said blade to control the protrusion of the same, substantially as described.

5. The combination of a rotating carrier, a plurality of in-and-

out movable folding-blades thereon, and a cam revolving about the same axis as said carrier but at a different rate of speed and connected independently with said blades to control the protrusion thereof, substantially as described.



6. The combination of a rotating carrier provided with a plurality of folding-blades, and moving cams connected with said blades at each end of the carrier for causing the protrusion of said blades each during non-consecutive revolutions of the carrier, substantially as described.

7. The combination of a rotating carrier provided with a plurality of folding-blades, and rotating cams connected with said blades at each end of the carrier for causing the protrusion of said blades each during non-consecutive revolutions of the carrier, substantially as described.

8. The combination of a rotating carrier provided with a plurality of folding-blades, and rotating cams having the same axis of rotation as said carrier and connected with said blades at each end of the carrier for causing the protrusion of said blades each during non-consecutive revolutions of the carrier, substantially as described.

9. The combination of a rotating carrier provided with a plurality of folding-blades, rotating cams connected with said blades at each end of the carrier, mechanism for rotating said cams in time different from that of the carrier, said mechanism having disconnectible parts, and means for locking said cams against motion while said mechanism is disconnected, substantially as described.

10. The combination of a rotating carrier provided with a plurality of folding-blades, rotating cams having the same axis of rotation as said carrier and connected with said blades at each end of the carrier, mechanism for rotating said cams in time different from that of the carrier, said mechanism having disconnectible parts, and means for locking said cams against motion while said mechanism is disconnected, substantially as described.

11. The combination of a rotating carrier provided with a plurality of reciprocating folding-blades, rotatory cams for protruding said blades, mechanism provided with disconnectible parts for rotating said cams and said cylinder in different times, and means for locking said cams against motion, substantially as described.

12. The combination of a rotating carrier provided with a plurality of folding-blades, movable cams for protruding said blades, and mechanism provided with disconnecting parts for operating said cams and for locking them against motion, substantially as described.

13. The combination of cylinder G, three non-rotative folding-blades mounted thereon, cams N connected with said folding-blades, and mechanism for revolving said cylinder and said cams in different times, substantially as described.

14. The combination of an internal guide or V-shaped former, a pair of rolls at the apex thereof, and a collar on at least one of said rolls, said collar being of a diameter somewhat greater than the diameter of the corresponding roll and being adjustable longitudinally relatively to its said roll and coacting with a web-margin, substantially as described.

15. The combination of an internal guide or V-shaped former, a pair of rolls at the apex thereof, and collars on said rolls, said collars being of diameters somewhat greater than the diameters of their respective rolls, and one collar per roll being adjustable longitudinally relatively to its roll, and said adjustable collars coacting with a web-margin, substantially as described.

16. The combination of an internal guide or V-shaped former, a pair of rolls at the apex thereof, and collars adjustable longitudinally of said rolls, each collar being of greater diameter than its own roll and said adjustable collars coacting with a web-margin, substantially as described.

17. The combination of a web-press whose two impression-cylinders rotate in opposite directions and perfect a web, a second web-press whose impression-cylinders all rotate in one direction, and a third (perfecting) web-press, with mechanism for driving the impression-cylinders of the third press in opposite directions or in the same direction, whereby two webs may be printed upon on both sides and one of them may receive multicolored impressions upon one side or may be perfected merely with but one color upon each side, substantially as described.

18. The combination of a web-press whose two impression-cylinders rotate in opposite directions and perfect a web, a second web-press whose impression-cylinders all rotate in one direction, and a third (perfecting) press, with mechanism for driving the impression-cylinders of the third press in opposite directions or in the same direction, said presses being one above another, a web-associator, and a folding-machine to which the associated webs are taken, whereby two webs may be printed upon on both sides and one of the webs may receive multicolored impressions upon one side or may be perfected merely with but one color on a side, substantially as described.

19. The combination of a web-press having its impression-cylinders geared together to rotate in opposite directions, a second web-press having a pair of impression-cylinders, disconnectible gearing for connecting said pair of impression-cylinders to cause them to rotate in opposite directions, and disconnectible gearing between a cylinder of the first press and the first impression-cylinder of the second press for driving the last-named cylinder in the same direction as the second-impression cylinder of the second press, whereby each press may perfect its own web, or one web may be run through both presses and receive impressions on but one side in one of said presses, substantially as described.

20. The combination of the impression-cylinders i of press C, impression-cylinders i^2 i^3 of press D, gears 46 47 connecting the last-named cylinders, one of said gears being movable along or disengageable from its shaft, and gears 48 49 50 connecting the first impression-cylinder of press C with the first impression-cylinder of press D, one of said gears 48 49 50 being movable along or disengageable from its shaft, substantially as described.

21. The combination of a pair of impression-cylinders arranged adjacent each other, disconnectible gearing between said cylinders for driving them in opposite directions, a second pair of impression-cylinders, said pairs of cylinders being arranged one over the other, form-cylinders coacting with said impression-cylinders, said pairs of impression-cylinders and their coöperating form-cylinders constituting two perfecting-presses, and disconnectible gearing between a cylinder of the press containing said second pair of impression-cylinders and the first impression-cylinder of the press containing said first-named pair of impression-cylinders, said last-named gearing being arranged for driving said first impression-cylinder in the same direction as its companion impression-cylinder, substantially as described.

22. The combination of a plurality of web-perfecting presses, a brake mechanism for and coacting with a cylinder of each press, a power-controller, a lever, and means for connecting said lever with said controller and with said brake mechanisms, whereby said brakes are applied and taken off as the power is taken off and put on, with driving mechanism for said presses, connecting by a single gear with the power-shaft, substantially as described.

23. The combination of a plurality of web-perfecting presses, a brake mechanism for and coacting with a cylinder of each press, a power-controller, rock-shaft 60, mechanism for connecting said controller and said brake mechanisms with said shaft to be operated simultaneously, means for actuating said shaft, and driving mechanism for said presses connecting by a single gear with the power-shaft, substantially as described.

24. The combination of a plurality of web-perfecting presses, a brake mechanism for and coacting with a cylinder of each press, a power-controller, rock-shaft 50, a lever on said shaft, mechanism for connecting said lever with said controller and with said brake mechanisms, and driving mechanism for said presses connecting by a single gear with the power-shaft, substantially as described.

25. The combination of a plurality of web-perfecting presses, a brake mechanism for and coacting with a cylinder of each press, a drive-shaft, a single gear on said shaft and connected with all of said presses to drive the same, tight and loose pulleys on said shaft, a slow-speed pulley on said shaft between said tight and loose pulleys, a belt-shifter, and connections whereby said brake mechanisms are operated simultaneously with the shifter as the latter moves the belt onto and off the loose pulley, substantially as described.

26. The combination of a plurality of web-perfecting presses, a brake mechanism for and coacting with a cylinder of each press, a drive-shaft, a single gear on said shaft and connected with all of said presses to drive the same, tight and loose pulleys on said shaft, a slow-speed pulley on said shaft between said tight and loose pulleys, a belt-shifter, an operating-lever, and connections between said lever and said shifter and said brake mechanisms for operating the same, substantially as described.

27. The combination of a number of web-perfecting presses placed one above another, a brake mechanism for and coacting with a cylinder of each press, gearing connecting said presses with a common source of power, and means for simultaneously operating all said brake mechanisms as the power is thrown off, substantially as described.

28. The combination of a number of web-printing presses arranged one above another, a drive-shaft geared with all said presses, a brake mechanism for and coacting with a cylinder of each press, a power-controller, and means for simultaneously operating said controller and said brake mechanisms, substantially as described.

29. The combination of a plurality of rotary printing-presses provided each with a brake mechanism coacting with a cylinder thereof, a common driving power for said presses, a power-controller, and means for simultaneously actuating said controller and said brake mechanisms, substantially as described.

30. The combination of a rotating carrier provided with grippers, a cylinder receiving sheets folded from said carrier, and means for guiding the sheets to the carrier in a direction cutting across (secantwise) the same at a point adjacent the point where the sheets are folded off from the carrier, substantially as described.

31. The combination of a rotating carrier provided with folding-off devices, grippers on said carrier, means for feeding sheets to said grippers in a direction which cuts across the carrier or in secantwise thereof at a point adjacent that where the sheets are folded off, and a delivery-cylinder coacting with said carrier, substantially as described.

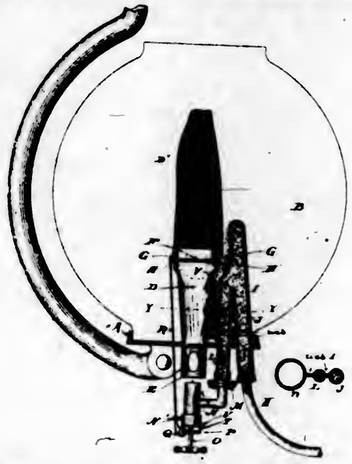
32. The combination of a transverse web-cutting device, a rotating carrier provided with grippers, and a sheet-guideway from said cutting device to said carrier directing the sheets to said carrier secantwise thereof and having a space or opening adjacent the cylinder into which the grippers push the tails of the sheets that may be on the carrier as the grippers open and seize the heads of the following sheets, substantially as described.

810,226. VAPOR-LAMP. EDWARD SMITH, Peoria, Ill. Filed Sept. 28, 1904. Serial No. 226,517.

Claim.—1. A vapor-lamp of the character described, comprising a combustion-chamber having a mantle thereon, a jet-orifice in its side and near its top, and a cut-off valve at its top, a vapor-generator alongside the combustion-chamber, a regulating-valve to control the flow of vapor from the said valve to the combustion-chamber and means connected to the vapor-generator to automatically close the top of the combustion-chamber when the valve is operated and allowing the escape of heated gases through the jet-orifice and their projection against the vapor-generator, substantially as described.

2. A vapor-lamp comprising a combustion-chamber having a mantle thereon a gasolene-vapor generator lying at the side of said chamber and mantle, a cut-off valve in the top of the combustion-chamber, there being a jet-orifice in the side of the chamber opposite the generator for the purposes described, and means coöperating with the two valves for automatically closing the cut-off valve when the needle-valve is operated.

3. In a gasolene-vapor lamp the combustion-chamber having a mantle thereon, a vapor-generator adjacent thereto substantially as described, a valve for controlling the vapor-supply to the lamp a cut-off valve for closing the top of the chamber automatically when the controlling-valve is operated, means between the cut-off valve and controlling-valve for causing the action described, there being a jet-orifice in the side of the generator near the top for escape of heated gases against the vapor-generator when said cut-off valve is closed.



4. In a vapor-lamp, the combustion-chamber having a mantle thereon, a valve for controlling the gas admitted to such chamber, a vapor-generator adjacent to the combustion-chamber through which the gasolene must pass to reach the controlling-valve, a cut-off valve in the top of the combustion-chamber, means between the controlling-valve and the cut-off valve for closing the latter as the former is operated, there being a jet-orifice in the side of the combustion-chamber near its top and beneath the cut-off valve for allowing escape of heated gases therethrough for their projection against the vapor-generator substantially as described.

5. In a vapor-lamp, the combination of the combustion-chamber and its mantle, a vapor-generator adjacent to said chamber to which the controlling-valve of the lamp is connected, a jet-orifice in the side of the chamber near the top, a cut-off valve in the top of the combustion-chamber for inclosing the vapor therein and causing the escape of the heated gases through the said orifice and their projection against the vapor-generator, and a connection between the cut-off valve and the controlling-valve for closing the former by partially shutting the latter as and for the purposes described.

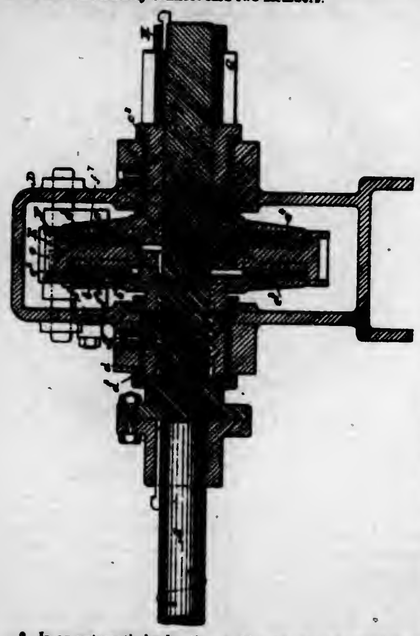
6. A vapor-lamp comprising a combustion-chamber having a mantle thereon, a combustion-chamber for the vapor, the same being positioned beside the said combustion-chamber for receiving heat from the latter and its mantle, there being a jet-orifice in the side of the combustion-chamber near its top, and a rocking cut-off valve at the top of the said combustion-chamber, operated automatically by the turning of the controlling-valve of the lamp, the said cut-off valve inclosing the heated gases and causing them to pass out through the said orifice and means between and connecting said valves for causing the action described.

7. A vapor-lamp comprising the combustion-chamber D having the mantle D' thereon, the vapor-generator J, L situated close to said combustion-chamber and extending close up to and opposite the mantle as shown, the needle-valve O beneath the combustion-chamber and connected with the said generator for entering vapor into said chamber, the cut-off valve F in the top of the latter member, a rod member R for rocking the said valve F to open or close the chamber containing it, said rod having attachment with the valve O, the operation of the latter adapted to operate the cut-off valve also automatically for the purposes described, there being a jet-orifice beneath the cut-off valve in the side of the combustion-chamber opposite the vapor-generator as described and shown.

810,227. AUTOMATIC BRAKE. GEORGE W. SIMS, Alliance, Ohio, assignor to The Alliance Machine Company, Alliance, Ohio, a Corporation of Ohio. Filed Aug. 29, 1904. Serial No. 223,557.

Claim.—1. In an automatic brake, the combination of a driv-

ing-shaft; a member screw-threaded thereon; a second member journaled on said shaft and fixed longitudinally thereof; and a device adapted to be actuated by the longitudinal movement of said first member to frictionally connect said two members.



2. In an automatic brake, the combination of a driving-shaft; a member screw-threaded thereon; a second member journaled on said shaft and rotatably fixed relatively to said first member; and a device adapted to be actuated by the longitudinal movement of said first member to frictionally connect said two members.

3. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded member mounted upon the threaded portion of said driving-shaft and movable longitudinally of the axis of said shaft; a second member journaled upon said driving-shaft and rotatably fixed relatively to said first member; and a friction device actuated by the longitudinal movement of the latter for frictionally connecting said two members.

4. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded member mounted upon the threaded portion of said driving-shaft and movable longitudinally of the axis of said shaft; a second member journaled upon said driving-shaft, fixed longitudinally of the axis thereof, and rotatably fixed relatively to said first member; and a friction device actuated by the longitudinal movement of the latter for frictionally connecting said two members.

5. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded member mounted upon the threaded portion of said driving-shaft and movable longitudinally of the axis of said shaft; a second member journaled upon said driving-shaft and rotatably fixed relatively to said first member; friction devices actuated by the longitudinal movement of the latter; and a ratchet-wheel mounted intermediately of said two members and arranged to move in one direction of rotation of the shaft and fixed in the opposite direction.

6. In an automatic brake, the combination of a driving-shaft; a member mounted thereon and movable longitudinally of the axis thereof; means for causing such longitudinal movement; a second member journaled upon said shaft and fixed longitudinally of the axis thereof; said two members adapted to engage so as to be rotatably fixed relatively to each other; and friction devices mounted intermediately of said two members and actuated by the longitudinal movement of said first member.

7. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded sleeve formed with a flange, engaging the threaded portion of said shaft, and having a limited movement longitudinally of the axis of the latter; a member journaled upon said driving-shaft, fixed longitudinally of the axis thereof, provided with a flange, and rotatably fixed relatively to said sleeve; and a ratchet-wheel and friction devices mounted intermediately of said flanges, said friction devices actuated by the longitudinal movement of said sleeve, and said ratchet-wheel arranged to move in one direction of rotation of the shaft and fixed in the opposite direction.

8. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded sleeve formed with a flange, engaging the threaded portion of said shaft, and having a limited movement longitudinally of the axis of the latter; a member journaled upon said driving-shaft, fixed longitudinally of the axis thereof, provided with a flange, and engaging said sleeve so as to be rotatably fixed relatively thereto; a second member mounted intermediately of said flanges and arranged to move in one direction of rotation of said shaft and fixed in the opposite direction; friction devices mounted intermediately of said flanges respectively and said second member; and a pinion rotatably fixed relatively to said journaled member, and rotatable relatively to said shaft.

9. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded sleeve mounted upon such threaded portion and provided with a flange; a member journaled to said driving-shaft and provided with a flange; a frame provided with bearings for said sleeve and journaled member; a disk mounted intermediately of said two flanges and provided with ratchet-teeth; friction devices mounted intermediately of said disk and said flanges respectively; a pawl having a fixed axis and arranged to engage said ratchet-teeth; and a pinion rotatably fixed to said journaled member, said sleeve and journaled member being rotatably fixed to each other, and arranged so that the former may have a limited movement longitudinally of the axis of the driving-shaft, said friction devices being actuated by the longitudinal movement of said sleeve.

10. In an automatic brake, the combination of a driving-shaft provided with an externally-threaded portion; an internally-threaded sleeve mounted upon such threaded portion and provided with a flange; a member journaled upon said driving-shaft; a member mounted intermediately of such sleeve and journaled member arranged to rotate in one direction of rotation of said driving-shaft, fixed in the opposite direction, and arranged to be frictionally engaged from opposite sides, said sleeve having a limited movement longitudinally of the axis of the driving-shaft, being rotatably fixed to said journaled member and separated from the latter a distance normally greater than the distance of such longitudinal movement.

11. In an automatic brake, the combination of a driving member; a driven member journaled thereon and fixed longitudinally thereof; a third member keyed to said driven member and longitudinally and rotatably movable with reference to said driving member; and a device adapted to be actuated by the longitudinal movement of said third member to frictionally connect said member with said driven member.

12. In an automatic brake, the combination with two rotatable members axially movable relatively to each other, of a friction-disk mounted therebetween and provided with ratchet-teeth and a flange on one side of said teeth, and a pawl having a fixed axis, one end of said pawl being adapted to engage said teeth and the other end to ride on said flange.

13. In an automatic brake, the combination of a driving-shaft, a member screw-threaded thereon; a second member journaled upon said shaft and keyed to said first member and a friction-disk mounted between said two members and provided with ratchet-teeth and a flange on one side of said teeth, and a pawl having a fixed axis, one end of said pawl being adapted to engage said teeth and the other end to ride on said flange.

810,228. FURNACE-ROOF. EDWIN B. SLICK, Pittsburg, Pa. Filed July 1, 1904. Serial No. 214,661.

Claim.—1. A metal-heating furnace having a roof inclined longitudinally, said roof being in a substantially flat longitudinal plane; substantially as described.

2. A continuous heating-furnace having a roof lying in a substantially flat plane and inclined longitudinally from one end of the heating-chamber to the other; substantially as described.

3. A heating-furnace roof containing rows of thick bricks with recesses in their side faces intermediate of the height of the brick-body, and depending hangers having a row of separated supports engaging the recesses of adjacent bricks; substantially as described.

4. A heating-furnace roof containing rows of thick bricks with recesses in their side faces intermediate of the height of the brick-body, and depending hangers having separated supports engaging the recesses of adjacent bricks, hangers being movable endwise of the row to move the support away from a brick and allow it to be removed; substantially as described.

5. A heating-furnace roof having rows of thick bricks with registering recesses in their side faces forming a continuous air-channel along the row, and hangers having a row of separated supports arranged to engage the recesses of adjacent bricks; substantially as described.

6. A heating-furnace roof having bricks with cut-away upper portions, and having side faces with transverse grooves extending across them, and bolts or hangers having a row of separated supports engaging the recesses of adjacent bricks; substantially as described.

7. A heating-furnace having a roof inclined longitudinally and formed of bricks lying in a substantially flat plane longitudinal of the furnace; substantially as described.

8. A heating-furnace having a roof inclined longitudinally in a substantially flat plane, said roof being made up of bricks suspended by overhead hangers; substantially as described.

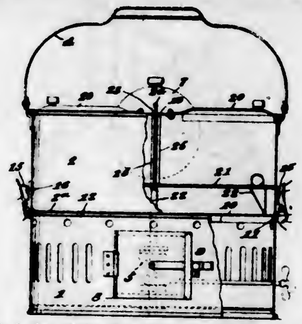
9. A continuous heating-furnace having a roof lying in a substantially flat plane, and comprised of bricks suspended by overhead hangers, the furnace-chamber being contracted gradually in vertical height from one end toward the other, said furnace having an inlet and outlet at or near its opposite ends to receive a continuous row of metal blanks; substantially as described.

10. A continuous heating-furnace having a substantially flat roof formed of bricks suspended by overhead hangers, said roof being longitudinally inclined toward the floor of the furnace-chamber, said furnace-chamber having an inlet at one end leading from a source of heat, and an inlet at or near the other end to receive the row of metal blanks; substantially as described.

11. A continuous heating-furnace of longitudinal tunnel-form, having a substantially flat longitudinally-inclined roof, an inlet for metal blanks at or near the smaller end of the furnace-chamber, and an outlet for blanks of the row at or near the larger end, said furnace-chamber having a gaseous inlet at or near the larger end and a gaseous outlet at or near the smaller end; substantially as described.

810,229. WARMING-KETTLE. HERMAN STANGE, Cincinnati, Ohio. Filed Feb. 13, 1905. Serial No. 245,491.

Claim.—1. A device of the character described comprising an upper member having a closed bottom provided with a pendent flange extended around it and having a ledge extended outside the flange, spring-clips oppositely arranged upon said upper member and provided with hook-shaped ends beneath said ledge and a lower member open at its top to receive the pendent flange of the upper member and adapted to contain a heater and having side walls, the upper edges of which are provided with a continuous external bead for supporting engagement with the ledge of the upper member and for detachable engagement with the hook-shaped lower ends of the clips thereon.



2. A device of the character described comprising an upper member having a closed bottom provided with a pendent flange extended around it and having a ledge extended outside the flange, spring-clips centrally pivoted upon said upper member and provided with hook-shaped lower ends beneath said ledge and devices pivotally held on the upper member for engagement with the upper ends of the clips to hold them against movement.

3. A device of the character described comprising a member having a closed bottom, side walls and an open top, a single perforated tray removably supported therein and extended across the entire surface of the bottom thereof, a central strip transversely extended across the top of the member and provided with a longitudinal slotted opening, a partition removably passed through the slotted opening of the strip and removably inserted in the member with its lower part rested on said tray to divide the interior of the member into compartments, guides engaged with said removable partition and covers hinged at oppoitse sides of said strip and adapted, when lowered, to close the open top of the member and, when raised, to afford access to the compartments at opposite sides of the partition.

4. A device of the character described comprising a member having a closed bottom, side walls and an open top, a central strip transversely extended across the top of the member and provided with a longitudinal slotted opening, a partition removably passed through said slotted opening of the strip and removably inserted in the member to divide its interior into compartments, guides engaged with said removable partition and covers hinged at opposite sides of the strip and adapted, when lowered, to close the open top of the member and, when raised to afford access to the compartments at opposite sides of the removable partition.

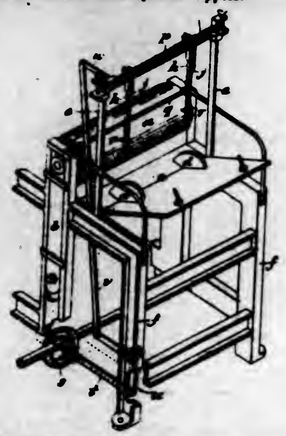
810,230. BIT-EXTENDER. WILLIAM B. SWAN, Seymour, Conn. Filed Aug. 18, 1905. Serial No. 274,813.

Claim.—In a bit-extender, an externally-threaded chuck provided with a tapering socket at its lower portion terminating in a centrally-located recess extending longitudinally into the body of the chuck, said body being formed with horizontal recesses adjacent to said longitudinal recess, a coil-spring in said recess, a bell-crank locking-lever having bearings in said horizontal recesses, said locking-lever comprising a long arm provided with a latch and a short arm extending transverse of the axis of the chuck, said short arm being arranged whereby it will be acted upon by the said spring to force the long arm to an unlocked position, and an internally-threaded sleeve for said chuck adapted to retain the locking-lever in a locked position.

810,231. DELIVERY MECHANISM FOR PRINTING-PRESSES. CHARLES B. SWIFT, Muskegon, Ind. Ter. Filed Jan. 14, 1905. Serial No. 241,026.

Claim.—1. A sheet-delivery mechanism comprising a rocking shaft, depending arms secured thereto comprising a fixed member

and a movable member pivoted to the fixed member, nippers carried by said arms, one of said nippers being stationary with relation thereto and the other being actuated by the movable member, and stationary stops arranged to engage alternately the movable member above and below its pivotal position to open the nippers.

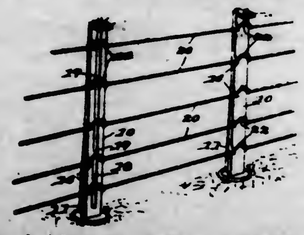


2. In a sheet-delivery mechanism for printing-presses, the combination with a rocking shaft, a depending member rigidly secured thereto, nippers secured to said member, one of said nippers being stationary with relation thereto and the other being pivoted and provided with gear-teeth, of a member pivoted to said fixed member and provided on its lower end with gear-teeth meshing with the movable nipper, and means for actuating said movable member independently of the movement of the fixed member, substantially as described.

3. In a sheet-delivery mechanism for printing-presses, the combination of the rocking shaft, a depending member fixed with relation thereto, nippers upon said fixed member, a movable member pivoted to the fixed member and engaging said nippers to open the same, a spring for normally holding the nippers in their closed position, stationary stops arranged to engage the movable member to open the nippers, and means for actuating the shaft.

4. In a sheet-delivery mechanism for printing-presses, the combination of a rocking shaft, a depending member fixed with relation thereto, nippers upon said fixed member, a movable member pivoted to said fixed member and offset at one end and operatively connected at the other end with said nippers, a fixed stop to engage said offset end of the movable member at one end of its path to open the nippers, and a fixed stop to engage the other end of said movable member at the other end of its path to open said nippers.

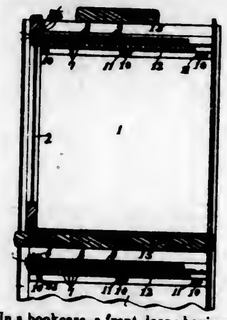
810,282. COMBINED POST AND WIRE-STRETCHER. GEORGE W. TRUMAN, Yosemite, Ky. Filed Sept. 6, 1905. Serial No. 277,207.



Claim.—1. A fence-post comprising a standard having one side thereof formed with a flat bearing-surface provided with spaced downwardly-extending wire-engaging lugs, a vertically-adjustable stretching-strip movable over the flat bearing-surface of the post and having its inner face provided with spaced notches adapted to engage the wires between the lugs for stretching said wires longitudinally of the post, and means for locking the stretching-strip in adjusted position.

2. A fence-post comprising a standard having one side thereof formed with a flat bearing-surface and one end with a laterally-projecting flange provided with a threaded opening, there being spaced downwardly-extending wire-engaging lugs formed on the opposite longitudinal edges of the flat side of the post, a vertically-adjustable stretching-strip movable over the flat bearing-surface of the post and having one end thereof threaded for engagement with the opening in the flange and its inner face provided with a series of spaced notches adapted to engage the wires between the lugs, and a nut threaded on the strip and engaging the flange for locking the stretching-strip in adjusted position.

810,283. BOOKCASE. FRED W. TOMEY, Grand Rapids, Mich. Filed Jan. 17, 1905. Serial No. 241,512.



Claim.—1. In a bookcase, a front, loops having extensions provided with lateral recesses, screws in the inner side of the front and near the upper edge thereof, which screws engage the recesses in loop extensions, and a rod for supporting the front horizontally and rotatively mounted in said loops.

2. In a bookcase, a front having a horizontal groove in its inner surface, a rod rotative in the groove, means for supporting and guiding the rod in the case, loops surrounding the rod and having tangential extensions provided with lateral recesses, and screws inserted in the front and engaging the recesses.

3. In combination with the movable front and the ends of a bookcase, a horizontally-movable rod to support the front, a pinion rotative with the rod and longitudinally movable on one end of the same, a rack engaging the pinion and fixed on one end of the case, a plate spaced apart from said end of the case to form a channel therebetween to guide the pinion, a pinion on the other end of the rod, and a rack on the other end of the case to engage the said pinion.

4. In combination with the movable front and the ends of a bookcase, a horizontally-movable and rotative rod, means for attaching the front to the rod, pinions on the rod, and plates attached to the ends and having upwardly-projecting portions engaging the teeth of the pinions, and also having inwardly-pressed portions engaging the inner sides of the pinions.

5. In combination with the front and ends of a bookcase, a rod journaled on the front, rolls and pinions on the rod, and plates secured to the ends of the case and having upwardly-projecting teeth engaging the pinions, said plates also extending upward opposite the pinions to guide the same and thence extended horizontally to form tracks for the rolls.

6. In combination with the front and ends of a bookcase, a rotative rod attached to the front and supporting the same, a pinion on each end of the rod, said pinions being rotative with the rod, supports attached to the ends and having slots to receive the rod and also having an upper surface to support the front, and teeth on the supports to engage the teeth of the pinions.

7. In combination with the ends and the movable front of a bookcase, a rod journaled on the front and supporting the same, rolls rotative on the rod, pinions movable longitudinally of the rod and rotative therewith, and plates secured to the ends and having upwardly-projecting portions forming teeth to engage the pinions, said plates also having inwardly-pressed portions engaging the sides of the pinions, horizontally-extended portions supporting the rolls and traversed thereby, slots traversed by the rod, and upper horizontal portions to support the front.

8. In a bookcase, a front having a horizontal groove, a rod rotative in the groove, a roll on each end of the rod, a pinion on each end of the rod and rotative therewith, said pinions also being movable toward and from each other, ends having vertical rabbets and horizontal rabbets, and plates secured to the ends below the horizontal rabbets, said plates having portions forming teeth to engage the teeth of the pinions, inwardly-pressed vertical portions to engage the sides of the pinions, horizontal portions supporting the rolls and traversed thereby, slots traversed by the rod, and upper portions supporting the front.

810,284. DEVELOPING-MACHINE. WILLIAM M. TOWERS and HERBERT S. HARRINGTON, Rome, Ga., assignors of one-fourth to Edward C. Hume, Rome, Ga. Filed June 20, 1905. Serial No. 266,168.

Claim.—1. In apparatus of the character specified, the combination with a film-spool, of a cylindrical casing comprising telescoping sections, a cover for the open end of the casing, and provided with a screw-threaded opening, a stud-shaft journaled in the cover, and having its inner end cut away to fit the slot in the end of the film-spool, a crank on the outer end of the shaft, a support secured to the cover and extending into the casing, a clamp on the support, a bracket slidably mounted on the support, a set-screw in the bracket and engaging the support, a pin on the free end of the bracket for engaging the opposite end of the film-spool, and a screw-threaded plug for engaging the opening in the cover.

2. In apparatus of the character specified, the combination with a film-spool of a cylindrical casing comprising telescoping sections, a cover for the casing provided with an opening, means on the cover for engaging the slotted end of the film-spool and for rotating the same, a support secured to the cover and extending into the casing, a bracket slidably mounted thereon, a set-screw in the bracket and engaging the support, a pin on the free end of the bracket for engaging the opposite end of the film-spool, and means for closing the opening in the cover.

3. In apparatus of the character specified, the combination with a film-spool of a cylindrical casing comprising telescoping sections, a cover for the casing, means on the cover for engaging the slotted end of the film-spool and for rotating the same, a support attached to the cover and extending into the casing, a clamp on the support, means on the support for engaging the opposite end of the film-spool and means for adjusting the engaging means.

4. In apparatus of the character specified, the combination with a film-spool of a cylindrical casing comprising telescoping sections, a cover for the casing, means on the cover for engaging the slotted end of the film-spool, means for rotating said engaging means, means secured to the cover for engaging the opposite end of the film-spool and means for adjusting said last-named engaging means.

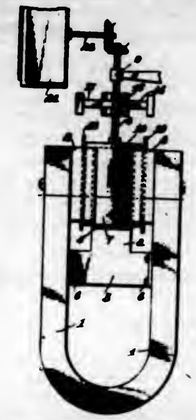
5. In apparatus of the character specified, the combination with a film-spool of a cylindrical casing, a cover for the casing, means on the cover for engaging the slotted end of the film-spool and for rotating the same, means connected with the cover for engaging the opposite end of the film-spool, and means for adjusting said engaging means.

810,285. ELECTRICAL MEASURING INSTRUMENT. THOMAS W. VARLEY, New York, N. Y., assignor of one-half to Walter B. Rugg, New York, N. Y. Filed Feb. 6, 1905. Serial No. 244,303.

Claim.—1. An electrical measuring instrument comprising a permanent magnetic field, a stationary coil adapted to shift the lines of force of the magnetic field, and a movable coil in the magnetic field normally in a balanced condition relative thereto but becoming unbalanced when the magnetic field is shifted.

2. An electrical measuring instrument comprising a permanent magnetic field, a stationary coil adapted to shift the lines of force of the magnetic field, a movable coil in the magnetic field normally in a balanced condition relative thereto but becoming unbalanced when the magnetic field is shifted and means for measuring the extent of movement of the movable coil.

3. An electrical measuring instrument comprising a permanent magnetic field, a stationary coil adapted to shift the lines of force of the magnetic field, a movable coil in the magnetic field normally in a balanced condition relative thereto but becoming unbalanced when the magnetic field is shifted, means for controlling the movement of the movable coil whereby said movement is caused to be proportional to the torque of the movable coil and means for measuring the extent of said movement.

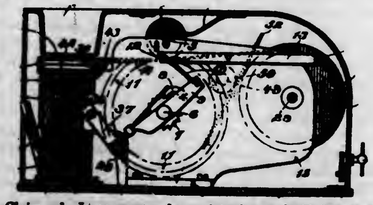


4. In an electrical measuring instrument a permanent magnet for creating a field, a stationary coil and a movable coil, said stationary coil being so located as to shift the permanent magnetic field in proportion to the current which it carries, the torque of movement of the movable coil being proportional to the product of the current in the movable and the fixed coils.

5. In an electrical measuring instrument a permanent magnet for creating a field, a stationary coil thereon and a movable coil, one of said coils being adapted to carry current proportional to the load and the other to carry current proportional to the pressure, said stationary coil being so located as to shift the permanent magnetic field in proportion to the current which it carries.

6. In an electrical measuring instrument a permanent magnet for creating a field, a stationary coil or coils for creating a field to distort or displace said permanent field, a movable-coil armature in a balanced condition with relation to said permanent field when no current is traversing the stationary coil, the armature-coil and the stationary coil carrying current proportional to the current and the voltage so as to produce a torque proportional to the energy consumed.

810,286. APPARATUS FOR DAMPING AND AFFIXING ADHESIVE STAMPS. BASTIAAN C. A. VORSTER, Amsterdam, Netherlands. Filed Apr. 27, 1905. Serial No. 257,674.



Claim.—1. In apparatus for moistening and affixing stamps of the kind herein described, the combination with a feed-drum for feeding stamps forward, of a ratchet-wheel secured thereto, a spring-actuated lever with pawl engaging said ratchet-wheel, a spring-supported frame surrounding the moistening-pad adapted to be depressed by a stamp-detaching instrument, and connecting means between said frame and said lever to actuate the latter by the depression and subsequent rising of the frame so as to turn the drum a distance corresponding to the length of a stamp substantially as described.

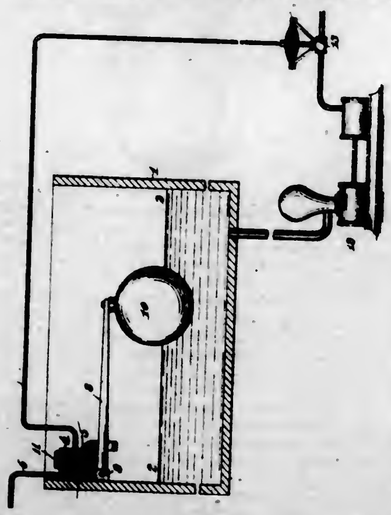
2. In apparatus for moistening and affixing stamps of the kind herein described, the combination with a drum for feeding stamps forward, of means to impart a step-by-step motion to said drum, consist-

ing of a spring-stud on a lever adapted to engage with recesses formed at equal distances apart around the periphery of the drum and of fly-wheel mechanism connected to said drum by gear-wheels, substantially as described.

3. In apparatus for moistening and affixing stamps of the kind herein described the combination with a feed-drum for feeding stamps forward, of a moistening-pad, of a transverse bar with sharp edge arranged at the side of the moistening-pad and adapted to cooperate with the edge of the detatching instrument to shear off the stamp on the pad when said instrument is pressed down thereon, substantially as described.

4. In apparatus for moistening and affixing stamps of the kind herein described the combination with a feed-drum for feeding stamp forward of a moistening-pad composed of three wicks arranged vertically side by side, and of thin transverse bars as a support for the stamp upon the pad, substantially as described.

810,237. MEANS FOR CONTROLLING THE LEVEL OF LIQUIDS. WILLARD WADSWORTH, Plainfield, N. J., assignor to William B. Wadsworth, Plainfield, N. J. Filed May 6, 1905. Serial No. 259,136.



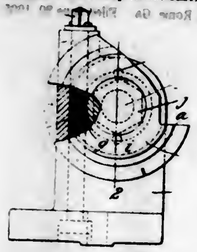
Claim.—1. In apparatus of the class described, the combination with a float, and oppositely-disposed inlet and exhaust valves directly engaged thereby, of a pump, a valve controlling motive fluid therefor, a fluid-pressure motor for said controlling-valve, and ducts controlled by said inlet and exhaust valves for admitting fluid under pressure to said motor, and exhausting same therefrom.

2. In apparatus of the class described, the combination with a pump, a valve for controlling motive fluid therefor, and a fluid-pressure motor for said valve, of a float, including a pivoted lever, and inlet and exhaust valves directly engaged by said float-lever, said inlet and exhaust valves arranged for admitting and exhausting fluid under pressure to and from said fluid-pressure motor.

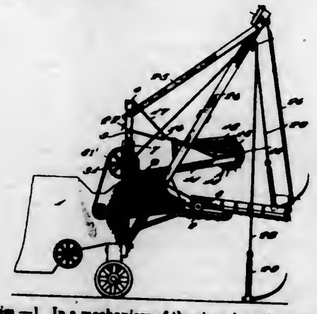
3. In apparatus of the class described, the combination with a pump, a controlling-valve therefor, and a fluid-pressure motor 14 for said valve, of a float 10, a float-lever 8 pivoted at 9 to a valve-casing 3, inlet and exhaust valves 4 and 5, in said casing, and having a stem extending therethrough and engaging the float-lever 8, a spring 11, opposite movements of the valves 4 and 5, and an inlet and distributing pipe 6 and 7 for controlling passage of motive fluid to and from the fluid-pressure motor 14, substantially as set forth.

810,238. TOOL HOLDING AND ADJUSTING DEVICE. FRANK W. WATTS, Springfield, Mass. Filed Sept. 27, 1904. Serial No. 226,127.

Claim.—The combination with a tool carrier or holder having a cylindrical socket therein, opening to one side of the holder, and having a hole of smaller diameter continued from said socket through to the opposite side of the holder, and having a hole or bore penetrating the body of the holder and intersecting said cylindrical socket at the side thereof, a tool or cutter and a cylindrical hub appurtenant thereto, provided with teeth circumferentially arranged, and fitting and inclosed within said socket, a screw-shaft endwise non-movable, fitted and rotatable in said bore of the carrier, traversing the side of said socket, and screw engaging the teeth of said hub, and a bolt having at one end a head and receiving at the other end a nut, passed axially through the carrier and the tool, and said hub, and operative to bind the adjusted tool non-rotatably to the carrier.



810,239. FEEDING ATTACHMENT FOR THRESHERS. NELS WALBERG and FRED J. MCARTHUR, Aberdeen, S. D. Filed Aug. 29, 1903. Serial No. 171,374.



Claim.—1. In a mechanism of the class described, the combination with grain-conveying means, of a drum for actuating the same, a shaft for imparting movement to said drum, a clutch member carried by said shaft, bars fixed to said drum, gripping devices carried by said bars, and means for moving said drum into position for causing said gripping devices to engage said clutch member.

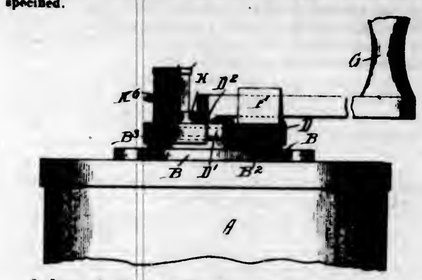
2. In a mechanism of the class described, the combination with grain-feeding means, of a drum for actuating the same, a shaft for driving said drum, a clutch member carried by said shaft, bars fixed to said drum formed with slotted end, gripping devices secured to said bars by attaching means passed through said slots, and rods engaging said gripping devices for spreading the same.

3. In a hoist for threshing-machines, the combination with a rotatably-mounted shaft, of a pulley fixed thereto formed with a clutch member, a drum mounted on said shaft, a bar carried by said drum, a pair of gripping devices adapted to engage the clutch member of said pulley, means adjustably connecting said bar to said grippers, means for adjustably spacing said grippers apart, and hoisting apparatus actuated by said drum.

4. In a hoist for threshing-machines, the combination with a rotatably-mounted shaft, of a clutch member carried thereby, a rotatably-mounted drum, bars connected to said drum and formed with slots at their end, gripping devices carried by said bars, means extending through said slots for adjustably securing said gripping devices to said bars, spacing-rods interposed between said gripping devices, means carried by said rod for adjustably spacing said gripping devices apart, said gripping devices being adapted to be moved into and out of engagement with said clutch member, and hoisting apparatus actuated by said drum.

810,240. ELECTRIC-MOTOR-CONTROLLER REGULATOR. PAUL A. WETZEL, Haywood, Ill. Filed June 14, 1905. Serial No. 265,213.

Claim.—1. In an electric controller-regulator of the kind described, the combination of a main body having a base, B, a cylindrical part B^3, a series of interior ratchet-teeth, B^4, and B^5, a series of studs, C and C', and a central aperture, B^6, said body being adapted to fit over an electric controller-rod and to be affixed to a controller, with a revoluble cover, D, having a central aperture, E, a jaw, F, adapted to receive the shank of a handle of an electric controller; and a pawl, J, pivotally attached to the inside of said cover, said pawl being adapted to be engaged by the studs, C and C', and to be deflected thereby into engagement with said ratchet-teeth; and means for returning said pawl from its deflected position to a normal position, J^4, substantially as described and for the purposes specified.



2. In an electric controller-regulator of the kind described a main body having a base, B, a cylindrical projection, B^3, a series of interior ratchet-teeth, B^4 and B^5, a series of studs, C and C', and an aperture, B^6; with a cover, D, having a central aperture, E, and a jaw, F; means for securing said cover on the base part, B^3, and of permitting the cover to be revolved thereon; and a pawl, J, pivotally supported in said cover, said pawl having a post, J^3, adapted to be engaged by the studs, C and C', and the pawl be hereby deflected when the cover is revolved, and means for returning said pawl from the deflected position to the normal position of rest, J^4, substantially as described and for the purposes specified.

3. In an electric controller-regulator of the kind described the combination of a main cylindrical body, having interior ratchet-teeth, studs and a central aperture, with a revoluble cover, having a central aperture, E, a jaw, F, and a stop-block, L, and a pawl, J, pivotally supported in said cover, said pawl being adapted to be engaged by the studs, C and C', in the said main body, and to be deflected thereby into engagement with the said ratchet-teeth when said cover is revolved; and means for returning said pawl from its deflected positions to a normal position, J^4, substantially as described and for the purposes specified.

4. In an electrical controller-regulator of the kind described, the combination of a main cylindrical body having a series of interior ratchet-teeth, and a series of studs, C and C', and a central aperture, B^6, and a cover, D, adapted to fit and to be revolved on said main body, said cover having a central aperture, E, a jaw, F, and stop-block, L; with a pawl, J, pivotally supported in said cover, said pawl being adapted to be engaged by the said studs and to be deflected thereby into engagement with the said ratchet-teeth when said cover is revolved on said main body; and means for returning said pawl when so deflected to a normal position of rest, J^4; substantially as described and for the purposes specified.

5. In an electric controller of the kind described the combination of a main cylindrical body having a series of interior ratchet-teeth, a series of studs and a central aperture, B^6, and a cover, D, adapted to fit and be revolved on said main body, said cover having a central aperture, E, a jaw, F, and a stop-block, L; with a pawl, J, pivotally supported in said cover, said pawl having a post, J^3, adapted to be engaged by the said studs, and to thereby deflect said pawl into engagement with the said ratchet-teeth when said cover is revolved on said main body; and means for returning said pawl when so deflected, to a normal position of rest; substantially as described and for the purposes specified.

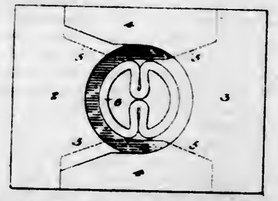
6. In an electric controller-regulator of the kind described, the combination of a main cylindrical body having a series of interior ratchet-teeth, a series of studs and a central aperture, and a cover, D, revolubly attached to said main body, said cover having a central aperture, E, a jaw, F, a stop-block, L, and a pivot-stud, I, said stud having a countersunk recess, I', with a pawl, J, adapted to be supported on said pivot-stud, said pawl being provided with a spring, J^3, and a pin, J^4, actuated by said spring, and being thereby forced into the recess, I', in the pivot-stud, I, said spring and pin being adapted to hold said pawl in a position of rest on said pivot-stud, and to return it to said position when deflected therefrom; substantially as described and for the purposes specified.

7. In an electric controller-regulator of the kind described the combination of a main cylindrical body having a series of interior ratchet-teeth, a series of studs, C and C', a central aperture, B^6; and a cover, D, revolubly attached to said main body, said cover having a central aperture, E, a jaw, F, a stop-block, L, and a pivot-stud, I, with a pawl, J, supported on the said pivot-stud, said pawl having an arm, K, extending through a suitable slot, K', in the cover, D, and a pair of cups, K^2 and K^3, attached to said arm, and a box, K^4, covering said cups and arm; said box being provided with an air-valve, K^5, and being attached to said cover; substantially as described and for the purposes specified.

8. The combination with an electric controller of a controller-regulator herein described, comprising a main body having a series of ratchet-teeth, a series of studs, and a central aperture, said body being provided with a cover revolubly secured thereon, said cover having a central aperture, a jaw, a pivot-stud, and stop-block, and a pawl supported on said pivot-stud, said pawl being adapted to be engaged by said studs and to be thereby deflected into engagement with said ratchet-teeth; and means for returning said pawl from the deflected positions to a position of rest; and means for regulating the time of the movement of said pawl from engagement with said teeth to a position of rest; substantially as described and for the purposes specified.

9. The combination with an electric controller of a controller-regulator, herein described, comprising a main body having a series of ratchet-teeth, a series of studs, and a central aperture, and a cover revolubly secured on said main body, said cover having a central aperture, a jaw, a pivot-stud, and a stop-block, and a pawl supported on said pivot-stud, said pawl being adapted to be engaged by said series of studs, and to be thereby deflected when said cover is revolved and means for returning said pawl from the deflected positions to a position of rest; substantially as described and for the purposes specified.

810,241. APPARATUS FOR REDUCING THE ENDS OF TUBES. MALCOLM WILKINSON, Shelby, Ohio, assignor to Shelby Steel Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Sept. 10, 1904. Serial No. 223,906.



Claim.—1. Apparatus for reducing the ends of tubes, comprising dies adapted to hold the tube in flattened condition at opposite sides, and when so held to subject it to compression at the other sides at opposite points to cause the non-flattened sides to approach each other; substantially as described

2. Apparatus for reducing the ends of tubes, comprising dies having an initial cavity for the end portion of the tube, acting portions which first flatten the tube in said cavity, and other acting portions which subsequently compress the non-flattened sides of the flattened tube at right angles to the direction in which it was flattened, to force said sides toward each other and thereby cause them to fold inwardly; substantially as described.

3. Apparatus for reducing the ends of tubes, comprising dies having a plurality of interfitting slots and projections recessed to form an initial cavity for the tube, and having acting portions which first flatten the tube to general oval form without materially changing the length of its circumference, and subsequently compressing the non-flattened sides of the tube toward each other; substantially as described.

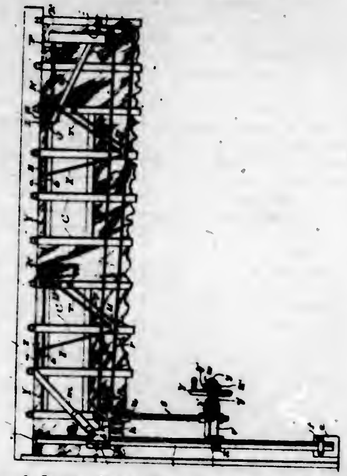
4. The combination of die parts formed with interfitted comb-like projections having an initial cavity adapted to compress and flatten the tube in one direction and when more fully closed to compress the tube at right angles thereto; substantially as described.

5. The combination of interfitting die parts having when fully opened middle inclined surfaces 5 which flatten the tube, and end portions 6 adapted to compress the non-flattened sides of the tube

after it has been flattened by the surfaces 5; substantially as described.

6. In apparatus for reducing the ends of tubes, dies having surfaces which first flatten the tube, and other surfaces which subsequently compress the non-flattened sides toward each other to therewith cause opposite portions of the flattened sides to fold inwardly toward each other; substantially as described.

810,242. SASH-OPERATING MECHANISM. ALVIN O. WOLF, Dayton, Ohio. Filed Mar. 31, 1904. Serial No. 200,267.



Claim.—1. In a sash-operating apparatus, the combination, with an inclosing structure comprising a ridge-pole and sashes, of a hanger connected with said ridge-pole, an upright, brace devices connected with said pole and upright, said hanger, upright and brace devices being located below the ridge-pole and laterally offset with respect to the vertical plane thereof, a cable, sash-rods directly connecting said cable with the sashes, to which their ends are respectively pivoted, supporting-wheels for said cable carried by said hanger and by said upright and brace devices respectively, and operating devices to rotate one of said wheels in either direction, substantially as described.

2. In a sash-operating apparatus, the combination, with hanger and brace devices, and reversible devices for supporting them at either side of a fixed part of the structure, of a cable, sash-rods connected thereto and adapted for connection with the sashes, supporting-wheels for said cable carried by said hanger and brace devices, and means to operate one of said supporting-wheels in either direction.

3. In a sash-operating apparatus, the combination, with a hanger, and brackets to connect it with a ridge-pole, of a wheel carried by said hanger, a column and brace devices to connect it with a house structure, a bearing-plate carried by the column and having mounted therein another supporting-wheel and operating-gears, hand-operated gears connected with the first-named gears, a cable mounted on the supporting-wheels, and brace-rods and sash-lifters connected with the cable and adapted respectively to connect with the house structure and the sashes.

4. In a sash-operating apparatus, the combination, with a column, of a bearing-plate connected thereto, a shaft in said bearing carrying a bevel-gear and a sprocket-wheel, a driving-shaft connected to said bearing and having a pinion meshing with said gear, another bearing-plate connected to the column and carrying a hand-operated pinion, and a gear-wheel meshing with said pinion and mounted on the driving-shaft.

5. In a sash-operating apparatus, the combination, with a column, of a bearing-plate connected thereto, a reversible fork connected to the bearing-plate and having a brace adapted for connection with a ridge-pole, and an arm on the column similarly adapted for connection with the ridge-pole, whereby the column and the parts it sustains may be held to, but at one side, of the ridge-pole.

6. In a sash-operating apparatus, the combination, with a ridge-pole and a hanger including a brace, of reversible brackets connected with the hanger and brace and adapted for connection with the ridge-pole, the reversibility of the brackets acting to sustain the hanger and braces at either side of such pole.

7. In a sash-operating apparatus, the combination, with a hanger, of a lever pivoted thereto, a cable-supporting wheel carried by the lever, and means to adjust the lever to vary the position of said wheel to affect the tension of the cable.

8. In a sash-operating apparatus, the combination, with a hanger and brace devices adapted for connection with a house structure, of a cable, sash-rods connected thereto and adapted to connect with the sashes, supporting-wheels for said cable carried by said hanger and brace devices, and operating devices to rotate one of said wheels in either direction, the other wheel being eccentrically mounted to lengthen the cable so as to compensate for the arc described by the sash-rods when the sashes are being lifted.

9. In a sash-operating apparatus, the combination, with a sash-operating cable, sash-rods secured to the cable and to the sash, wheels upon which the cable is carried, one of them being eccentrically mounted for the purpose set forth.

810,243. SHOW-CASE. GEORGE C. WRIGHT, Cleveland, Ohio. Filed Mar. 24, 1905. Serial No. 251,746.

Claim.—1. In a show-case, the combination with a glass front and a wooden back, of a glass end door comprising a single unframed glass plate carried by a vertical strip hinged to the back, said carrying being accomplished by a metal channel-shaped member secured to one end of the strip and projecting horizontally therefrom and extending onto and secured to the horizontal edge of the door.

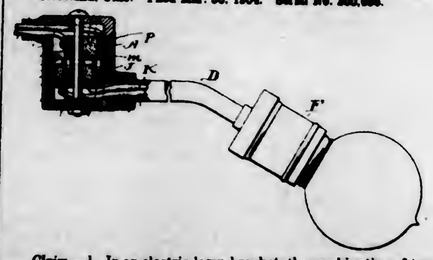
2. In a show-case, the combination of a hinged strip, a glass door, a channel-shaped member secured to the strip and extending onto the upper edge of the glass door and secured to it, the vertical edge of the door opposite the strip being free from framing.

3. In a show-case, the combination of a glass door, consisting of a single plate of glass having its vertical edges unframed a swinging channel-shaped member extending along the upper edge of the glass door and secured to it, said member extending downwardly onto the far edge of the door to prevent its sagging.

4. In a show-case, the combination of a glass door, of a pair of channel-shaped members in which the upper and lower edges of the door seat respectively, said members being secured to the door, and a hinge construction connected with said members, the vertical edges of the door being unframed.

5. In a show-case, the combination with the back, a strip hinged thereto, a pair of members secured to said strip, a glass door seating at its upper and lower edges in said members respectively, the upper one of said members being channel-shaped and extending the full width of the door and having means passing onto the far edge thereof.

810,244. ELECTRIC-LAMP BRACKET. GEORGE C. WRIGHT, Cleveland, Ohio. Filed Mar. 30, 1904. Serial No. 200,696.



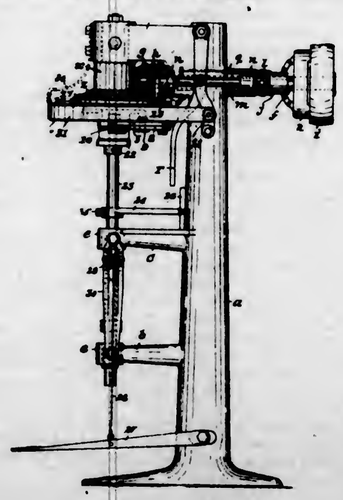
Claim.—1. In an electric-lamp bracket, the combination of two hollow members each comprising a cup-like body with a tubular extension, such cups being adapted to fit together, a pivot-bolt by which said members are pivotally connected, solid insulating-blocks secured in said members and having faces close to each other, a pair of arcual contact-plates carried by such face of one of the members, a pair of metal stripe set into slots in the other member and extending over onto the face of that member and adapted to be electrically connected with said arcual plates.

2. In an electric-lamp bracket, the combination of a hollow member having a tubular projection by which it may be fixed to a suitable support, a second hollow member which is pivotally connected to such fixed member and has a tubular projection, an insulating-block in one of said members, metallic contact-plates carried thereby, contact-wires entering the hollow member through said tubular projection and fastened to said contact-plates, an insulating-block in the other hollow member having slots in its sides, two metallic pieces which enter said slots and have their ends turned over onto the distant face of said block and are connected with two wires leading in from the corresponding tubular projection, said metallic pieces being electrically connected with members which contact with the metallic contact-plates first mentioned.

3. In an electric-lamp bracket, the combination of a hollow member, an insulating-block therein, metallic contact-plates carried thereby, contact-wires entering the hollow member and fastened to said contact-plates, a second hollow member which is pivotally connected to the member first mentioned, an insulating-block in said second hollow member having openings through it, two metallic pieces which occupy such openings and have their ends turned over upon the two faces of said last-mentioned block, the ends on the face nearest the other block being at different distance from the axis to enable individual connection between each of said metallic pieces and the corresponding contact-plate, and two wires whose ends occupy recesses in the block in said second hollow member and are connected with said metallic pieces by screws passing through said last-mentioned block.

4. In an electric-lamp bracket, the combination of a hollow member having a tubular projection by which it may be connected to a suitable support, a hollow member which is pivotally connected to said fixed member, an insulating contact-block in the fixed member, metallic contact-plates secured thereto, conductor-wires entering the hollow member through said tubular projection, and screws for fastening said wires to said contact-plates, an insulating-block in the other hollow bracket member having vertical slots in its sides, two metallic pieces having vertical members which enter said slots and have their ends turned over against the upper and lower faces of said contact-block, there being holes passing down through those metallic plates which lie against the upper surface of said insulating-block and down into said block, pins movable in said holes, spring-seated in said holes and forcing said springs outward, and lamp-wires, and screws for electrically connecting them to said metallic pieces, a hollow lamp-supporting arm secured to the movable bracket member, and lamp-socket secured to said arm.

810,245. CAN-HEADING MACHINE. BENJAMIN ADRIANCE and AMOS CALLESON, Brooklyn, N. Y.; said Calleson assignor to said Adriance. Filed June 17, 1903. Serial No. 161,777.



Claim.—1. The combination of means for holding the article to be shaped, means for shaping the article, and means for actuating the shaping means, all disposed with their axes approximately coincident, said third-named means being rotary with reference to said second-named means to bring the shaping means into and out of engagement with the article, and one of said first and second named means being rotary with reference to the other to cause the shaping means to travel around the article, substantially as described.

2. The combination, with means for holding the article to be shaped and means for shaping the same, said shaping means being movable rotatively around said holding means, of means, movable rotatively and concentrically with reference to the movement of said shaping means around the holding means, for actuating said shaping means to bring the same into shaping contact with said article, substantially as described.

3. The combination, with means for holding the article to be shaped, of a rotary part, a shaping-tool carried by said rotary part, and a cam engageable with said tool to actuate the same, said cam being rotary relatively to, and having its axis approximately coincident with that of, said rotary part, substantially as described.

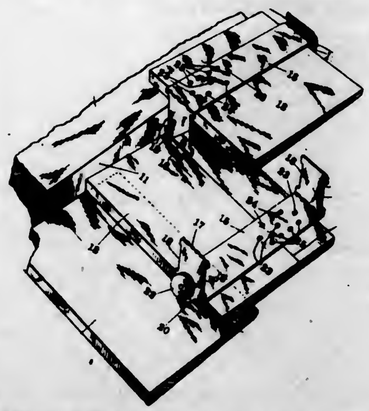
4. The combination, with means for holding the article to be shaped, of a shaping-tool, a part carrying said tool, and a cam engageable with said tool to actuate the same, said holding means and the tool-carrying part and the cam being concentrically disposed and said cam being movable rotatively and relatively to said tool-carrying part, substantially as described.

5. The combination, with means for holding the article to be shaped, of a lever, means for guiding one end of said lever in approximate coincidence with the contour of the article being operated upon, a rotary part in which said lever is fulcrumed, a shaping-tool carried by said lever, and a cam engageable with and adapted to actuate said tool, said rotary part and said cam being concentrically disposed and the latter being revoluble relatively to the former, substantially as described.

6. The combination, with means for holding the article to be shaped, of a lever, means for guiding one end of said lever in approximate coincidence with the article being operated upon, a rotary part in which said lever is fulcrumed, a shaping-tool fulcrumed in said lever, and a cam engaging with and adapted to actuate said tool, said rotary part and said cam being concentrically disposed and the latter being revoluble relatively to the former, substantially as described.

7. The combination, with means for holding the article to be shaped, of shaping-tools, a rotary part carrying said tools, and cams engageable with said tools to actuate the same, said rotary part and the cams being concentrically disposed and the latter rotative relatively to the former, substantially as described.

810,246. WEATHER-BOARD GAGE. LEMAN C. ANDERSON, Indianapolis, Ind. Filed Mar. 13, 1905. Serial No. 249,903.



Claim.—1. A weather-board gage consisting of, a main body portion having a straight edge, and end pieces arranged at an angle to said body portion each with the end of an edge in the plane of the straight edge portion of the main body and an intermediate portion of said edge removed, an abutment carried by said tool and adapted

to engage the edge of a weather-board, the said main body being provided with means by which a marking instrument may be maintained at a predetermined distance from said abutment.

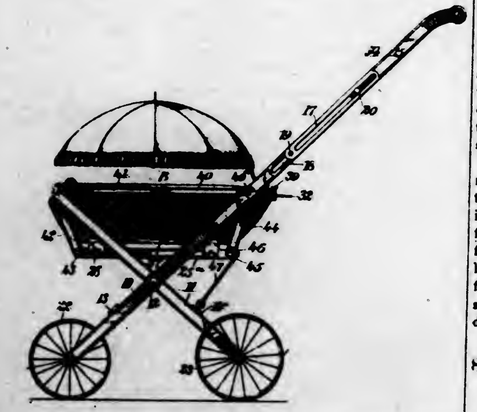
2. A weather-board gage consisting of, a main body having downturned ends, said main body having its edges straight, and said downturned ends having intermediate portions of their edges removed and the ends of their edges in the plane of the corresponding straight edges of the main body, an abutment carried by said tool and adapted to engage the edge of a weather-board, the said main body being provided with means by which a marking instrument may be maintained at a predetermined distance from said abutment.

3. A weather-board gage consisting of, a main body, and end members arranged at an angle thereto, said end members each having at its end a transverse projecting portion in the plane of the straight edge of the main body portion, an abutment carried by said tool and adapted to engage the edge of a weather-board, the said main body being provided with means by which a marking instrument may be maintained at a predetermined distance from said abutment.

4. A weather-board gage consisting of, a main body having ends downturned from said body at an angle thereto and one of said ends doubled back upon itself to form a spring portion the end of which projects above the main body, and means for adjusting said spring portion toward and from the main body, the said main body having perforations formed through it and arranged at various distances from the projecting portion of the spring member, and the said downturned portions having intermediate portions of their edges removed, for the purpose set forth.

5. A weather-board gage consisting of, a main body having ends downturned therefrom at an angle thereto, the said downturned portions having intermediate portions of their edges removed, a lip carried by the main body at one end and projecting from the surface opposite to that from which the adjacent downturned end projects, the said main body having formed through it a plurality of perforations at various distances from said projecting lip, for the purposes set forth.

810,247. FOLDING BABY-CARRIAGE AND CRADLE. IGNATIUS ANDREWS, New York, N. Y. Filed Jan. 7, 1905. Serial No. 240,006.

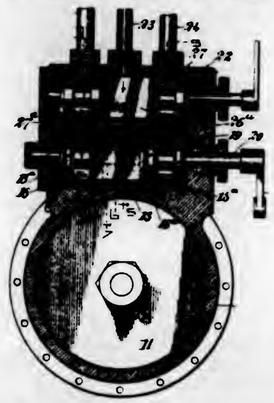


Claim.—1. In baby-carriages, a folding, wheel-supported support, a body provided with hinged side and end members, and spreader-bars for the side members, which spreader-bars also serve as supports for the end members, a rocking connection between the body and said support, and means for holding the body stationary.

2. In baby-carriages, crossed and pivotally-connected legs, wheels carried by the legs, a body comprising a bottom, hinged side and end members, spreader-bars for the side members adjustably connected therewith, which spreader-bars also serve as supports for the end members, pivotally-connected links pivotally connected with the legs at each side of the structure, suspension-links extending from the pivotally-connected links, which suspension-links are pivotally connected with the bottom portion of the body, and means for holding all the parts in folded position.

3. In baby-carriages, crossed and pivotally-connected legs, wheels carried by the legs, a body comprising a bottom, and hinged side and end members, spreader-bars for the side members adjustably connected therewith, which spreader-bars also serve as supports for the end members, pivotally-connected links pivotally connected with the legs at each side of the structure, suspension-links extending from the pivotally-connected links, which suspension-links are pivotally connected with the bottom portion of the body, means for holding all the parts in folded position, locking devices for the body, acting to hold it stationary, and a locking device for an end member of the body, for the purpose specified.

810,248. STEAM-VALVE. JAMES D. AUSTIN and EDWARD N. AUSTIN, Campbell Hill, Ill., assignors of one-third to Harvey Hoover, Campbell Hill, Ill. Filed Mar. 15, 1905. Serial No. 250,269.



Claim.—1. In an engine, a piston-cylinder, a main-valve casing arranged therein, a reversing-valve casing having communication with the main-valve casing, a main valve in the first main casing and having a flattened body portion, oppositely-extended segmental flanges at the ends of the body portion, disks secured to and spaced from said flanges, packing-rings arranged in said disks and flanges, a reversing-valve in the reversing-valve casing and having a flattened body portion, oppositely-extended segmental flanges at the ends thereof, disks spaced from said flanges, and oppositely-extended cut-off wings arranged between the flanges and disks, the said reversing-valve being longitudinally tapered.

2. In an engine, a piston-cylinder, a main-valve casing arranged thereon, a reversing-valve casing having port communication with the main-valve casing, a main valve in the first-named casing having a flattened body portion, oppositely-extended segmental flanges at the ends of the body portion, disks secured to and spaced from said flanges, a reversing-valve in the reversing-valve casing having a flattened body portion, oppositely-extended segmental flanges at the ends thereof, disks spaced from said flanges, and oppositely-extended cut-off wings arranged between the flanges and disks.

810,249. METHOD OF REFINING COPPER. RALPH BAGGALEY, Pittsburg, Pa., CHARLES M. ALLEN, Lolo, Mont., and EDWARD W. LINDQUIST, Chicago, Ill.; said Allen and Lindquist assignors to said Baggaley. Filed June 5, 1905. Serial No. 263,693.

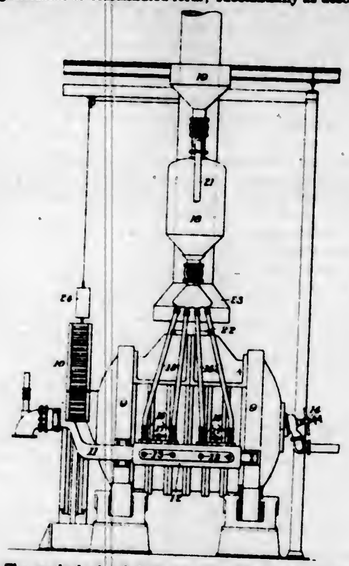
Claim.—1. The method of refining copper which consists in injecting into a bath of molten copper, granulated or comminuted hydrocarbon-gas-producing material, non-abrasive and of such nature that it will not melt and clog in the twyers at the temperature there present; substantially as described.

2. The method of refining copper which consists in injecting sawdust into a bath of molten copper; substantially as described.

3. The method of refining copper which consists in injecting sawdust into a bath of molten copper in a Bessemer converter after oxidation; substantially as described.

4. The method of refining copper which consists in injecting sawdust into a bath of molten copper in a Bessemer converter before oxidation is completed and utilizing air under pressure as the propelling medium; substantially as described.

5. The method of refining copper which consists in injecting with air-pressure into the molten copper before suboxid has been formed, hydrocarbon-gas-producing material of a non-abrasive kind in a granulated or comminuted form; substantially as described.



6. The method of refining copper which consists in injecting hydrocarbon-gas-producing material of a non-abrasive kind, in a granulated or comminuted form, into a molten bath of black or blister copper by means of an air-blast under pressure before the stage of oxidation has been reached where appreciable amounts of suboxid have been formed in the bath; substantially as described.

7. The method of refining copper, which consists in injecting sawdust into a molten bath of copper by means of an air-blast, before the completion of the converting operation and in the same vessel in which the converting action has brought the bath of molten copper to a point ready for refining; substantially as described.

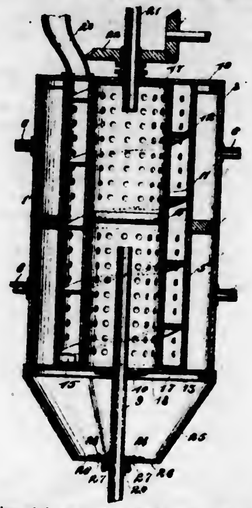
8. The method of refining copper, which consists in injecting into a bath of molten copper, sawdust whose hydrocarbon-gas-producing power has been augmented with fusible hydrocarbon; substantially as described.

810,250. SUGAR-MACHINE. OTTO B. BARTH, Loveland, Colo. Filed Apr. 17, 1905. Serial No. 256,027.

Claim.—1. A machine of the class described, comprising a drum having a cylindrical perforated inner wall, divided into an upper and a lower compartment and provided with vacuum-pipes communicating with said compartments; a revoluble tubular perforated member in said drum, having an upper and a lower compartment and a screw-wing, the latter coacting with the inner wall of the drum, means to introduce steam and blue water respectively into the upper and lower compartments of the revoluble perforated tubular element, and means to discharge the sugar from the space between said perforated element and the perforated inner wall of the drum.

2. In a machine of the class described, the combination of a drum having an upper and a lower compartment and a perforated cylindrical inner wall, vacuum-pipes leading from the said compartments of the drum, a revoluble tubular perforated element in said drum, divided into upper and lower compartments and having a screw-wing to scrape the perforated inner wall of the drum, means to introduce steam and blue water respectively into the upper and lower compartments of said revoluble perforated element, and a revoluble valve in the bottom of the said drum in the space between said revoluble perforated element and the perforated inner wall of the drum, substantially as described.

3. A machine of the class described comprising a drum having a cylindrical perforated inner wall, divided into an upper and a lower compartment, and provided with vacuum-pipes communicating with said compartments; a revoluble tubular perforated member in said drum, having an upper and a lower compartment and a screw-wing, the latter coacting with the inner wall of the drum, means to introduce steam and blue water, respectively, into the upper and lower compartments of the revoluble perforated tubular element, means to discharge the sugar from the space between the said perforated element and the perforated inner wall of the drum, a compartment below the drum to receive the sugar discharged from the said space, and means to discharge sugar from said compartment.



4. A machine of the class described comprising a drum having a cylindrical perforated inner wall, divided into an upper and a lower compartment, and provided with vacuum-pipes communicating with said compartments, a revoluble tubular perforated member in said drum, having an upper and a lower compartment and a screw-wing, the latter coacting with the inner wall of the drum, means to introduce steam and blue water, respectively, into the upper and lower compartments of the revoluble perforated tubular element, means to discharge the sugar from the space between the said perforated element and the perforated inner wall of the drum, a compartment below the drum to receive the sugar discharged from the said space, and means to automatically discharge sugar from the said compartment.

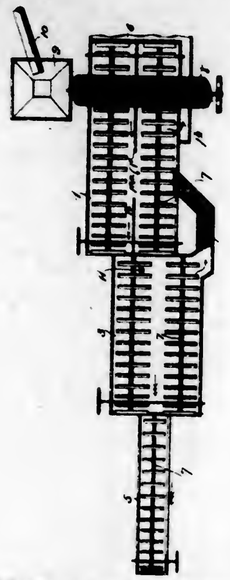
5. A machine of the class described comprising a drum having a cylindrical perforated inner wall, divided into an upper and a lower compartment, and provided with vacuum-pipes communicating with said compartments; a revoluble tubular perforated member in said drum, having an upper and a lower compartment and a screw-wing, the latter coacting with the inner wall of the drum, means to introduce steam and blue water, respectively, into the upper and lower compartments of the revoluble perforated tubular element, means to discharge the sugar from the space between the said perforated element and the perforated inner wall of the drum, a compartment below the drum to receive the sugar discharged from the said space, and spring-closed valves to automatically discharge sugar from said compartments.

810,251. MACHINE FOR WASHING SAND. RICHARD O. BIDWELL, South Vineland, N. J. Filed July 13, 1905. Serial No. 269,391.

Claim.—1. A device of the character described, comprising a number of inclined tanks or receptacles all arranged in longitudinal alinement with each other and one having one end overhanging the contiguous end of the other tank, and successive ones having lateral chutes or troughs discharging or delivering one into the other, means effective to take the contents of one tank to another and finally discharge the same from each end of the series of tanks, and means for feeding the material to be treated to one of the intermediate tanks.

2. A device of the character described, comprising a number of inclined tanks or receptacles, all arranged in longitudinal alinement with each other and one having one end overhanging the contiguous end of the other tank and successive ones having lateral

chutes or troughs discharging or delivering one into the other, endless belts of elevators arranged to take the contents of one tank to another and finally discharge the same from each end of the series of tanks and means for feeding the material to be treated to one of the intermediate tanks.



3. A device of the character described, comprising a number of inclined tanks or receptacles all arranged in longitudinal alinement with each other and one having one end overhanging the contiguous end of the other tank and effective to deliver one into the other and a settling-tank arranged intermediately of said inclined tanks, successive tanks having lateral troughs or chutes, one delivering into an adjoining inclined tank and the other delivering into said settling-tank, endless belts of elevators arranged to conduct the contents of one tank to the other, and finally dispose of the same and means for feeding the material to be treated to one of the intermediate tanks.

4. A device of the character described comprising a series of inclined tanks or receptacles, all arranged in longitudinal alinement with each other and one having one end overhanging the contiguous end of the other tank and an intermediate settling-tank supplied from one of said inclined tanks and delivering into another of the latter, said inclined tanks being equipped with endless belts of elevators effective to conduct the contents thereof, one to the other, and finally dispose of the same, and a sieve or screen superposed with relation to an intermediate one of said inclined tanks and adapted to deliver its screened contents thereinto and its unscreened contents beyond said tank.

5. A device of the character described, comprising a number of inclined tanks and a settling-tank, one of said inclined tanks having a trough or chute delivering laterally into an adjoining similar tank and a third inclined tank delivering in like manner into said settling-tank, two of the intermediate tanks being inclined in the same direction and the third intermediate tank being oppositely inclined about at the same general angle to the latter, and the end tanks being more precipitately inclined than the foregoing tanks and oppositely to one another, endless belts of elevators arranged in connection with said inclined tanks and effective to deliver the contents thereof at the upper ends of said end tanks, and a feeding or supplying sieve delivering its screened contents into one of said intermediate tanks.

810,252. TURBINE-ENGINE. GASTON C. B. DE BONNEMOSE, Paris, France. Filed Dec. 28, 1904. Serial No. 238,940.

Claim.—1. A rotary turbine device for the purpose specified, having a plurality of buckets composed of conduits, each conduit having a succession of alternating contractions and enlargements of its width, which latter increases in a direction from one end toward the other of the conduit, and having an undeviating central vein through said conduit.

2. A rotary turbine device for the purpose specified, having a plurality of buckets formed of laterally-undulating walls, and of partitions, the same being disposed to form conduits each with a succession of alternating contractions and enlargements of its width, which increase progressing in the direction from one end toward the other of the passage through the conduit, said passage having an undeviating central vein.

3. A rotary turbine device for the purpose specified, having a plurality of buckets, each provided with laterally-undulating walls, the undulations in said opposite walls being so disposed and alined as to form a succession of alternating contractions and enlargements of the passage through the conduit, and substantially normal to the flow of fluid in the turbine.

4. A rotary turbine device for the purpose specified, having a plurality of buckets, each provided with laterally-undulating walls, the undulations in said opposite walls being so disposed and alined as to form a succession of alternating contractions and enlargements of the passage through the conduit, and said buckets each provided at the fluid-outlet with a curved wall to utilize the live force remaining in changing the relative velocity of the fluid.

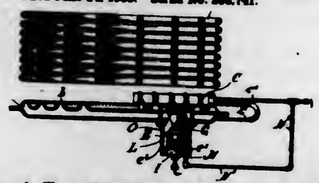
5. A rotary turbine device for the purpose specified, formed of a disk, hollow interiorly in such a manner as to present a series of undulations substantially normal to the flow of the fluid through the interior of said disk, the interior space thus formed augmenting in section from one end toward the other, as set forth.

6. A rotary turbine device for the purpose specified, formed of a disk, hollow interiorly in such a manner as to present a series of undulations substantially normal to the flow of fluid through the interior of the disk, and presenting also on its outer faces series of similar undulations, and an outer casing in which said disk rotates, said casing serving to receive the counter-pressure from the fluid.

7. A rotary turbine device for the purpose specified, consisting of a hollow disk constructed interiorly with a series of undulations substantially normal to the flow of the fluid within the disk, and with a series of undulations on each of its outer faces, and a casing in which the disk rotates, said casing having a series of undulalations on the inner faces of its walls, which are substantially normal to those of the disk.

8. A rotary turbine-engine, having a plurality of fixed adjutages for the supply of the fluid, a rotary part, a ring of buckets carried on the rotary part and separated by partitions provided at their inner ends each with a curved blade F, each bucket having a conduit for fluid extending through it, and said conduit having contractions formed by undulations in its lateral walls.

810,253. HYDROCARBON-BURNER. JOHN R. BOOKS, Nashville, Tenn. Filed June 24, 1905. Serial No. 266,741.



Claim.—1. The combination of a main burner, a casing open at the bottom and permanently attached to the main burner, a cup constituting an initial burner and having a detachable connection with the casing at its lower end, the lower member of the subburner detachably connected with the cup, and carrying a spraying-nozzle, the upper member of the subburner, means for supporting it on the cup or initial burner, a coil surrounding the upper member, and connected with the spraying-nozzle, a fuel-supply passage with which the coil is also connected, and a fuel-supply pipe detachably connected with the coil, the arrangement being such that all parts of the subburner are supported on the cup or initial burner and are detachable therewith and removable together through the bottom of the fixed casing.

2. The combination of the lower member of the subburner, a cup or initial burner surrounding it and detachably connected therewith, the upper member of the subburner, the yoke resting on the cup clamped thereto and supporting the upper member, a nozzle between the two members, a vapor-coil surrounding the burner, a supply-pipe to which the coil is detachably connected, a boss on the lower member of the burner and a detachable connection between the boss and the coil.

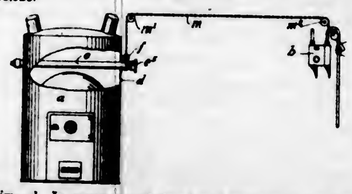
810,254. CLIMBING APPARATUS. HENRY BORNEMAN, Paterson, N. J. Filed Apr. 21, 1905. Serial No. 256,712.

Claim.—1. The combination of a guiding member, and coacting gripping members, the one having on each side of the axial line of the guiding member a projection and the other a recess corresponding projections and recesses fitting into each other, substantially as described.

2. The combination of a guiding member comprising two parts removably connected together, and coacting gripping members pivoted the one in the one and the other in the other of said guiding members, substantially as described.

3. The combination of a guiding member, and coacting gripping members pivoted therein, said gripping members having their gripping portions adjustable to and from each other in their respective gripping members, substantially as described.

810,255. EXPANSION-CONTROLLED APPARATUS. SEYMOUR W. BOUGHTON, Cleveland, Ohio. Filed Mar. 20, 1905. Serial No. 250,936.



Claim.—1. In apparatus of the class described, the combination with two expansion members formed of materials having different coefficients of expansion, the same being adapted to be subjected to heat, of a retained part or detent associated therewith and held in place thereby, self-actuating mechanism, and connecting means operatively coupling said mechanism and detent, normally withholding the mechanism from actuation, substantially as described.

2. In a heat-controlled appliance, the combination with variably-expanding members, of a detent or retaining part normally gripped or held in place thereby, an opposing part associated with and tending to release said detent, means for connecting said parts, and mechanism adapted to be actuated by the opposing part upon the altered condition of the expanding members, substantially as set forth.

3. The combination with a gas-burning device, of an expansion device associated therewith comprising two members having different coefficients of expansion, a detent normally held securely by said expansion device during the prevalence of a predetermined temperature, a valve controlling the gas-supply to the aforesaid device, mechanism associated therewith normally tending to close the said valve, and connecting means operatively coupling said mechanism and detent, substantially as set forth.

4. The combination with a gas-burning stove or furnace, of an expansion device comprising metal parts unequally affected by heat, a detent or key firmly gripped or held by said device during the prevalence of a predetermined temperature, a valve or cut-off and mechanism associated therewith tending to close the same, and means connecting the detent and the valve; whereby the latter is normally held in an open position during the continuance of a predetermined temperature in said stove or furnace, substantially as set forth.

5. In an expansion device, the combination with the brass and iron expansion members, the same affording a receptacle for a key or detent, a bifurcated or spring-like detent readily inserted in the appropriate recess afforded by the expansion members under conditions of relatively low temperature, an opposing part sustained but normally tending to withdraw said detent from the expansion device, and means for operatively coupling said part and the detent, substantially as set forth.

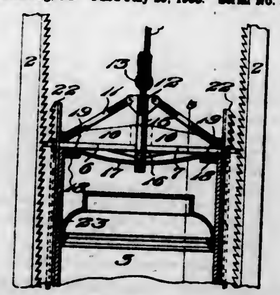
6. In an expansion-controlled appliance, the combination with a tubular part and a coacting part formed of metals having a different coefficient of expansion, a suitable gripping-recess being provided therebetween, of a detent or wedge inserted in said recess and normally gripped by the expansion members while subject to a predetermined temperature, self-actuating mechanism normally withheld from operation while the detent is held in place, and means for operatively coupling said mechanism and the detent, substantially as set forth.

7. In an expansion-controlled appliance, the combination with a tubular part and a coacting part formed of metals having a different coefficient of expansion, a suitable gripping-recess being provided therebetween, of a detent or wedge inserted in said recess and normally gripped by the expansion members while subject to a predetermined temperature, self-actuating mechanism normally withheld from operation while the detent is held in place, and means for operatively coupling said mechanism and the detent, and electrically-actuated alarm apparatus brought into operation upon the release of the detent, substantially as set forth.

8. In an expansion-controlled appliance, the combination with a tubular iron member, of its coacting brass member contained therein, a slot or recess being provided in the said tubular member, means for adjusting the relative positions of the expansion members, a spring-like detent or key inserted in said slot or recess adapted to conform to varying degrees of expansion of the gripping parts, and a retaining part for temporarily holding the key in place, substantially as set forth.

9. In an expansion device, the combination with the brass and iron expansion members, the same affording a receptacle for a key or detent, a bifurcated or spring-like detent readily inserted in the appropriate recess afforded by the expansion members under conditions of relatively low temperature, an opposing part sustained but normally tending to withdraw said detent from the expansion device, and a retaining member for temporarily holding the key or detent within its receptacle, substantially as set forth.

810,256. SAFETY-BRAKE FOR ELEVATORS. BENTON S. BOWMAN, Millersburg, Pa. Filed July 20, 1905. Serial No. 271,719.

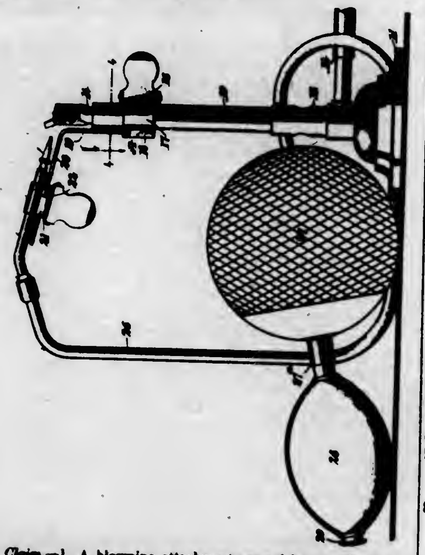


Claim.—1. In a safety-brake for elevators, the combination of guides provided with toothed racks, an elevator-car, spring-retracted dogs carried by the car to engage said racks, a head-frame fixed to the top of the car and comprising a base and side pieces forming a channeled guideway, a sliding fame having a stem operating in an opening in said base and adapted to be connected with and normally held inoperative by the hoisting-rope, a bowed spring disposed below the head-frame and slidably connected at its ends thereto and intermediately to the stem, divergently-arranged levers carried by said sliding frame and movable in the channeled guideway at their free ends to engage the dogs, and guide-pieces carried by the sliding frame to engage the side pieces of the head-frame.

2. In a safety-brake for elevators, the combination of guides provided with toothed racks, an elevator-car having upward extensions from its sides, spring-retracted dogs carried by the car to en-

gage said racks, a head-frame secured to said extensions and comprising a base and side pieces forming a channeled guideway, a bowed spring arranged beneath the base and slidably connected at its ends to the head-frame or extensions, a vertically-movable frame having a stem projecting through an opening in the base of the head-frame and intermediately connected with the bowed spring, said frame being adapted for connection with the hoisting-rope, divergently-arranged levers connected with said vertically-movable frame and movable in the channeled guideway to engage and project the dogs, and guide-pieces carried by said vertically-movable frame to engage the sides of the head-frame.

810,257. BLOWPIPE. WALTER M. BRADLEY, New Haven, Conn. Filed May 22, 1905. Serial No. 261,869.



Claim.—1. A blowpipe attachment comprising a pair of pivoted jaws, an arm fixed to one of said jaws, a second pair of pivoted jaws engaging the arm, and a tube carried by one of these last-named jaws.

2. The combination with a burner-tube, of a pair of pivoted jaws for engaging the tube, an arm fixed to one of the said jaws, a second pair of pivoted jaws engaging the arm, a tube-section carried between the second pair of jaws, a flexible tube communicating with the tube-section, and a storage-bulb and a pressure-bulb, communicating with the flexible tube.

3. The combination with a burner-tube, of a pair of pivoted jaws for engaging the tube, an arm fixed to one of said jaws, a second pair of pivoted jaws engaging the arm, a tube-section carried between the second pair of jaws, and a storage-bulb and a pressure-bulb communicating with the tube-section.

810,258. GUN-SIGHT. WILFRED BRAITHWAITE, Biddeford, Conn. Filed Aug. 19, 1905. Serial No. 274,921.

Claim.—1. The combination with a rifle, of a sight-mounting, a plurality of individual stems movably secured in the mounting and means carried by each of said stems adapted to cooperatively contact to insure the proper position of either of the stems with relation to the barrel.

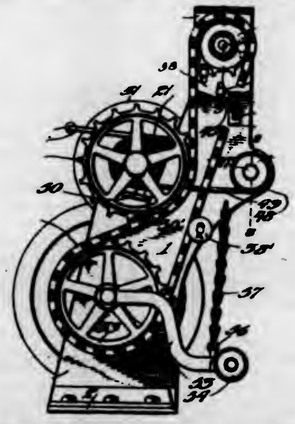
2. The combination with a rifle, of a sight-mounting therefor, a plurality of stems movably secured in said mounting, and projections carried by the stem designed for respective contact to insure a proper position of the stem in use.

3. The combination with a rifle, of a sight-mounting therefor, a plurality of stems pivotally connected to said mounting, each of said stems being hollow to adjustably receive sight-supporting pins, and a telescope removably secured to one of said sight-supporting pins.

4. The combination with a rifle, of a sight-mounting therefor, a plurality of stems pivotally connected to said mounting, each of said stems being hollow to adjustably receive sight-supporting pins, a telescope removably secured to one of said sight-supporting pins, said telescope comprising a barrel, and an adjustable section, the object end of the barrel being provided with a sight-receiving recess.

5. A gun-sight comprising a plate formed with projecting ears, and a plurality of sight-carrying stems, one of said stems having a single projecting leaf, and the other of said stems being formed with a pair of similar leaves, said latter leaves being spaced apart to receive the first-mentioned leaf between them, and all of the leaves being pivotally secured between the ears and the plate.

810,259. HOSE PULLER AND WRINGER. JAMES A. BRITTON, Bethlehem, Pa. Filed Jan. 26, 1905. Serial No. 242,328.



Claim.—1. A hose puller and wringer comprising a vertical supporting-frame having its upper portion disposed in rear of the plane of its lower portion, said frame being provided at the front with stop-shoulders at the junction of said portions, a drive-shaft journaled in the lower portion of the frame and carrying a driving-drum, a sprocket-wheel and operating means, a vertically-swinging frame pivotally mounted in the upper portion of the supporting-frame and adapted to engage said stops at the limit of its downward movement, a shaft journaled at the front of said pivoted frame and carrying a pressure-drum and a sprocket-wheel, a handle connected to the forward portion of the pivoted frame, a sprocket-wheel adjustably mounted upon the upper portion of the frame, a chain passing around said sprocket-wheel and the sprocket-wheel on the drive-shaft and having one of its stretches engaging the sprocket-wheel on the shaft of the pressure-drum, spring-arms attached at their forward ends to the front portion of the swinging frame to force the pressure-drum toward the driving-drum, and means adjustably connecting the rear ends of the spring-arms to the supporting-frame, whereby the pressure of said arms may be varied.

2. A device of the character described, comprising a frame, a stationary drum, a second drum movable toward and from the first drum, a pivoted support for said second drum, pressure devices comprising coil-springs having arms connected to and acting on said pivoted supports, and means associated with the coils of the springs for controlling the pressure and resistance thereof.

3. A device of the character described, comprising a frame, a stationary drum mounted therein, a second drum movable toward and from the first-named drum, a pivot-support for said first-named drum, bosses on the frame, coil-springs engaging said bosses and having arms connected with the pivoted support, heads for adjusting said springs, said heads being adapted to interlock with the bosses, and means for holding the heads in interlocking engagement.

4. In a device of the character described, a drum having a sectional hub composed of counterpart members provided with flanges forming a concaved seat, a concaved sectional rim formed of counterpart members seated between said flanges, a shaft extending through the hub, and means associated with said shaft for holding the counterpart hub and rim parts in assembled relation.

5. In a device of the character described, a drum having a sectional hub comprising counterpart cup-shaped members having their closed ends in abutting relation and their open ends provided with flanges forming a concaved seat, a concaved sectional rim formed of counterpart members occupying said seat and secured to said flanges, a shaft extending through the closed abutting ends of the head-sections, and means upon the shaft within the sockets of said section for clamping the same in assembled relation.

810,260. FENCE. SULLIVAN DUDLEY, Soldiers Home, Cal. Filed June 14, 1905. Serial No. 265,246.

Claim.—1. A fence of the character described, comprising fence-panels and supporting-posts therefor, an embedded post or support to which the panels are pivoted, an intermediate bracing-post pivoted to the embedded post or support and having a wide bearing thereon, and a band connecting the panel-posts and bracing-post together at their upper ends.

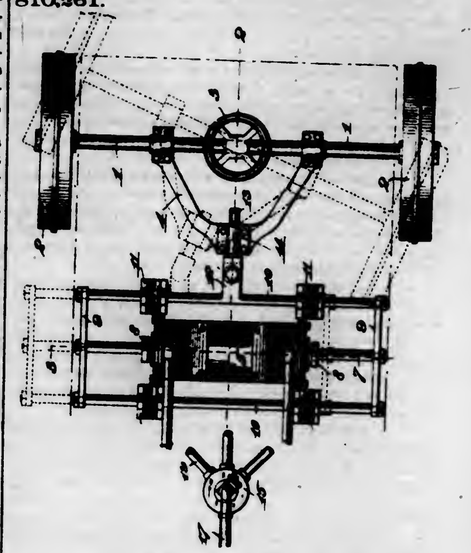
2. A fence of the character described, comprising the fence-panels having end posts rounded at their lower ends, embedded posts or supports to which the end posts of the fence-panels are pivoted at their lower ends, pintles D forming such pivots, an intermediate bracing-post having a slot through which the pintle passes and having a wide bearing on the embedded post or support, and a metal band pivoted to one of the panel-posts and engaging the companion posts.

810,261. STEERING-GEAR FOR TRACTION-ENGINES. PETER L. CANTELOU, Hillsboro, Tex. Filed June 26, 1905. Serial No. 267,161.

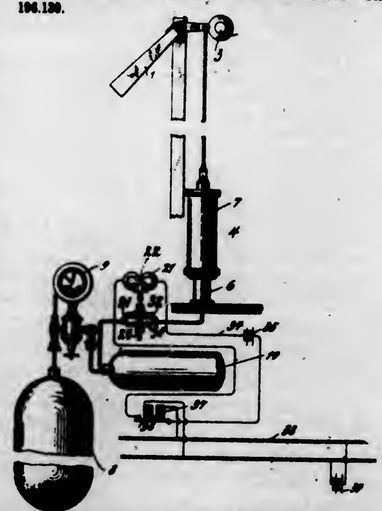
Claim.—1. The combination with a traction-engine, of a cylinder arranged beneath the body of the engine, a piston in said cylinder, piston-rods projecting through each end of the cylinder, a frame connected to the ends of the piston-rods and arranged to slide therewith, a yoke rigidly fixed to the front axle of the traction-engine, and a pivoted sliding connection between the frame and the yoke; substantially as specified.

2. In a steering-gear for traction-engines, a cylinder arranged beneath the body of the traction-engine, a piston operating in said cylinder, a piston-rod extending through each end of the cylinder, a frame carried by the ends of the piston-rod, a yoke rigidly secured to the front axle of the engine, a bearing at the apex of the yoke, a pin pivoted to the center of the frame of the piston-rod and arranged to slide in the bearing of the yoke, and means whereby fluid-pressure is admitted to each end of the cylinder; substantially as specified.

810,261.



810,262. RAILWAY-TRAFFIC-CONTROLLING APPARATUS. CLARENCE W. COLEMAN, Westfield, N. J., assignor to The Hall Signal Company, a Corporation of Maine. Filed Mar. 2, 1904. Serial No. 196,130.



Claim.—1. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point and means for admitting gas at a reduced pressure to said motor, substantially as described.

2. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point and means for admitting gas at a reduced pressure to said motor, substantially as described.

3. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, means

for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point and means for admitting gas at a reduced pressure to said motor, substantially as described.

4. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a signal, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point and means for admitting gas at a reduced pressure to said motor, substantially as described.

5. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point and means for admitting gas at a reduced pressure to said motor, substantially as described.

6. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, and means for admitting gas at a reduced pressure to said motor, substantially as described.

7. In a railway-traffic-controlling apparatus, the combination of means containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means and means for admitting gas at a reduced pressure to said motor, substantially as described.

8. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means and means for admitting gas at a reduced pressure to said motor, substantially as described.

9. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means and means for admitting gas at a reduced pressure to said motor, substantially as described.

10. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means and means for admitting gas at a reduced pressure to said motor, substantially as described.

11. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means and means for admitting gas at a reduced pressure to said motor, substantially as described.

12. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, means for preventing a predetermined rise from the reduced pressure produced by the reducing-valve and an admission-valve for admitting gas at a reduced pressure to said motor, substantially as described.

13. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, a reducing-valve, means for preventing a predetermined rise from the reduced pressure produced by the reducing-valve and an admission-valve for admitting gas at a reduced pressure to said motor, substantially as described.

14. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor and means for preventing the gas, after it passes the reducing-valve, from exerting a pressure upon said reducing-valve and admission-valve in excess of a predetermined amount, substantially as described.

15. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of a liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, and means for preventing the rise in pressure of the gas above a predetermined amount after passing the reducing-valve, without diminishing the mass of gas that has passed the reducing-valve, substantially as described.

16. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, and means for preventing the gas, after it passes the reducing-valve, from exerting a pressure upon said reducing-valve and admission-valve in excess of a predetermined amount without diminishing the mass of gas that has passed the reducing-valve, substantially as described.

17. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

18. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

19. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

20. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

21. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

22. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

23. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

24. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

25. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

26. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

27. In a railway signal apparatus, the combination of means for containing a local storage-supply of liquefied gas, a motor, a signal, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

28. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

29. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

30. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

31. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

32. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

33. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

34. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

35. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, means for preventing the gas at the reduced pressure from rising above a predetermined point without diminishing the mass of gas that has passed the pressure-reducing means, means for admitting gas at a reduced pressure to said motor, and means controlled by a train for controlling said gas-admitting means, substantially as described.

36. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and means for preventing the gas, after it passes the reducing-valve, from exerting a pressure upon said reducing-valve and admission-valve in excess of a predetermined amount, substantially as described.

37. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and means for preventing the gas, after it passes the reducing-valve, from exerting a pressure upon said reducing-valve and admission-valve in excess of a predetermined amount, substantially as described.

38. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and means for preventing the rise in pressure of the gas above a predetermined amount after passing the reducing-valve, without diminishing the mass of gas that has passed the reducing-valve, substantially as described.

39. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and means for preventing the gas, after it passes the reducing-valve, from exerting a pressure upon said reducing-valve and admission-valve in excess of a predetermined amount without diminishing the mass of gas that has passed the reducing-valve, substantially as described.

40. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, means for reducing the pressure of the gas, means for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

41. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, means for reducing the pressure of the gas, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

42. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a signal, means for reducing the pressure of the gas, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

43. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, means for reducing the pressure of the gas, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

44. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure of the gas, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

45. In a railway signal apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, a pivoted semaphore-blade, a weight for moving it in one direction, connections between the motor and the blade whereby the motor may move the blade in the opposite direction, means for reducing the pressure

of the gas, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

46. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting the gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

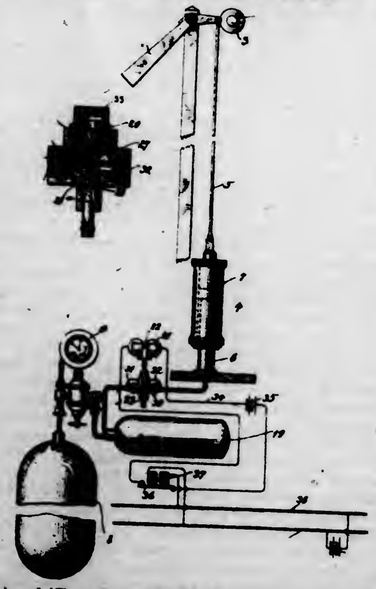
47. In a railway-traffic-controlling apparatus, the combination of means for containing a storage-supply of carbonic-acid gas, a motor, railway-traffic-controlling means, a reducing-valve, an admission-valve for admitting the gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

48. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a signal, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means.

49. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a motor, a pivoted semaphore-blade, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

50. In a railway signal apparatus, the combination of means for containing a storage-supply of liquefied gas, a pivoted semaphore-blade, a weight for operating said blade in one direction, a motor for returning said blade, a reducing-valve, an admission-valve for admitting gas at a reduced pressure to said motor, means controlled by a train for controlling said admission-valve, and a reservoir for receiving the gas after it has passed the pressure-reducing means, substantially as described.

810,263. PROCESS OF UTILIZING LIQUEFIED GAS FOR RAILWAY-TRAFFIC-CONTROLLING APPARATUS. CLARENCE W. COLEMAN, Westfield, N. J., assignor to Hall Signal Company, a Corporation of Maine. Filed Dec. 12, 1904. Serial No. 236,456.



Claim.—1. The process of utilizing liquefied gas for controlling railway traffic, which consists in permitting a small quantity of the liquid to be converted into gas, permitting the gas to expand intermittently into a reservoir of large capacity, and intermittently allowing a small quantity of said gas to actuate a gas-pressure-applying device to control said traffic.

2. The process of utilizing liquefied gas for controlling railway traffic, which consists in permitting a small quantity of liquid to be converted into gas by reducing the pressure on the liquid, permitting the gas to expand intermittently into a reservoir of large capacity, supplying heat to the gas during and after such expansion and intermittently allowing a small quantity of said gas to actuate a gas-pressure-applying device to control said traffic.

3. The process of utilizing liquefied gas for controlling railway traffic, which consists in permitting a small quantity of the liquid to be converted into gas by reducing the pressure on the liquid, permitting the gas during short periods of time and intermittently to expand into a reservoir of large capacity, supplying heat to the gas during and after such expansion and intermittently allowing a small quantity of said gas to actuate a gas-pressure-applying device to control said traffic.

4. The process of utilizing liquefied gas for controlling railway traffic, which consists in permitting a small quantity of liquid to be converted into gas by reducing the pressure on the liquid, permitting the gas to expand during short periods of time and intermittently into a reservoir of large capacity, allowing the gas to remain in said reservoir for longer periods of time so as to permit a supply of heat to the gas and intermittently allowing a small quantity of said gas to actuate a gas-pressure-applying device to control the traffic

5. The process of utilizing carbonic-acid gas for controlling a railway-signal, which consists in automatically and intermittently reducing the pressure of the gas, intermittently permitting the gas to expand into a reservoir of large capacity and intermittently causing the gas to operate a railway-signal

6. The process of utilizing liquefied carbonic-acid gas for controlling a railway-signal, which consists in permitting a small quantity of the liquid to be converted into gas by reducing the pressure on the liquid, permitting the gas to expand intermittently into a reservoir of large capacity, supplying heat to the gas and intermittently allowing a small quantity of the gas to actuate a gas-pressure-applying device to control said signal.

7. The process of utilizing carbonic-acid gas for controlling a railway-signal, which consists in permitting the gas to expand during short periods of time and intermittently into a reservoir of large capacity allowing the gas to remain in said reservoir for longer periods of time and intermittently allowing a small quantity of the gas to actuate a gas-pressure-applying device to control the signal.

8. The process of utilizing carbonic-acid gas for controlling a railway-signal, which consists in automatically and intermittently reducing the pressure of the gas, supplying heat to the gas while its pressure is being reduced, allowing the gas to expand into a chamber of large capacity, supplying heat to the gas while in said chamber and intermittently permitting a part of the gas in said chamber to expand into a gas-pressure-applying device for actuating a railway-signal in one direction.

810,264. DUMPING-VEHICLE. JEREMIAH CROWIN, New York, N. Y. Filed Apr. 14, 1905. Serial No. 255,554.

Claim.—1. In a mechanism of the class described, the combination with a truck and a movable body, of a guide-plate provided with angular ends secured to said truck, a removable, substantially U-shaped member positioned upon said guide-plate and secured to said body, a shaft provided with a squared, outer end journaled upon said truck, a cog-wheel fixedly secured to said shaft, plates secured to one side of said truck, said plates provided with guiding means, a rack-bar provided with a longitudinal cut-out portion engaging said plates and guiding means, said rack-bar meshing with said cog-wheel, a stop formed upon one of said plates for limiting the forward movement of said rack-bar, a projection secured to said body, a connecting member provided with bifurcated ends secured to said projection of the body and one end of the rack-bar, parallel, angular members secured near the sides and upon the bottom of said body, and means for locking said body upon said truck.

2. The combination with a truck and a movable body, of a shaft carried by said truck, a pinion provided with an annular flange fixedly secured to said shaft, a plate provided with an angular extension carried by said truck, a slidable rack-bar carried by said truck and positioned between said annular flange of the pinion and the angular extension of said plate, the rack-bar thereby engaging said pinion, and means connecting said rack-bar to said body.
